Musgrave Minerals (MGV)

Easy Digging

Analyst | Ben Crooks

Quick Read

Following the release of Musgrave's Stage 1 pre-feasibility study we have updated our modelled base case mining scenario. We no longer assume toll treating, and instead model our base case as a stand-alone project with the construction of a 500ktpa processing plant. In this scenario, our modelled financing assumptions and resultant equity dilution is the largest driver of our valuation decreases to \$0.33 (previously \$0.40). We consider this a floor price of the project progression routes, and have a modelled a toll treatment scenario, detailed herein, that does indicate further upside potential. We maintain a Speculative Buy recommendation.

Easy Digging

Updated Model: Additional changes to our model include a reduced real discount rate to 7% (prior 8%), the introduction of mining at Break of Day underground and Leviticus and Numbers open pits. Our average mined grade has increased, our total mined inventory decreased, resulting in a LOM reduced production of approximately 55koz compared to prior. We assume project financing through a 50:50 debt to equity ratio. Given the breakdown of financial data available in MGV's PFS, we were able to compare previous costs assumptions and calibrate our model. In back analysis, MGV's released costs represent an approximate 12% increase on our previous modelled assumptions, which we consider in line with industry costs movements.

Toll Treating Scenario: In our assumed toll treat scenario, we remove \$80M from pre-production capex, increase processing costs by 23% (representing a lower processing cost with a toll premium), introduce a 150km surface haulage. Due to reduced equity dilution (still maintain 50:50 debt to equity), our modelled Musgrave valuation increases by 19% to \$0.38, while only increasing the Cue Gold Project valuation by 7%.

Leveraging Optionality: While we consider MGVs optionality with respect to its high-grade deposit located centrally to 3 mills as strategic, it also has potential to present risk. There is already sufficient processing capacity in the area, and toll treating terms may not be entirely favourable, with bargaining terms generally dependent on the level of success or despair of the plant operator during negotiations. High grade material has an additional risk as grade reconciliation is often at the mercy of the plant operator. While the nature of the deposit may suit M&A activity, this is no guarantee, and no insight into a timeframe. We believe that for MGV to maintain bargaining power, and ipso facto, maximise shareholder value, MGV must be prepared to build. Building would impose new risks and expectations on MGV, as producers are expected to renew depleted reserves and to continue production. Given MGV's exploration upside, we don't see this as untenable. Furthermore, in the current environment, Argonaut thinks that MGV will have sufficient backing to kick off if required. With so many project progression routes, we don't see MGVs challenge as an ability to provide shareholder value, but how to leverage the situation to maximise it.

Spot Prices: If we use the current spot price of US\$2022/oz for gold at an exchange rate of 0.68, our base case MGV valuation increases to \$0.40.

Recommendation

Our Speculative Buy recommendation remains unchanged, with our base case valuation decreasing to \$0.33 (prior \$0.40). We see further upside potential to this dependent on the route of project progression, financing terms, and in the current gold environment. We reiterate the rare nature of high-grade, near-surface gold deposits in WA.

MGV's Stage 1 PFS

Musgrave Minerals recently released a Stage 1 PFS for their Cue Gold Project, Western Australia. The project envisages building a 500ktpa processing plant with an operational life of 5 years. Production averages just shy of 80kozpa in the first 3 years, ramping off in the last 2. MGV intend to fill this gap and extend the mine life in the Stage 2 PFS, which is currently scheduled to be released early CY24.

MGVs Stage 1 post-tax NPV₈ of \$215M and post-tax IRR of 91%

The study outlines a pre-production capital requirement of \$121M, a post-tax NPV $_8$ of \$215M and a post-tax IRR of 91% (pre-tax NPV $_8$ of \$235M and IRR of 95%). The AISC has been calculated at \$1315/oz. MGV have been remarkably transparent in their study with relation to the cost profile.

High average LOM recoveries of 97.8%, with up to 60% gravity recovery

The process plant has been designed and costed by GRES, with an average LOM recovery of 97.8%, and gravity recoveries achieving up to 60%. Two integrated landform tailings storage facilities have been designed, which will provide storage until the Leviticus pit has been mined and repurposed for tailings storage.

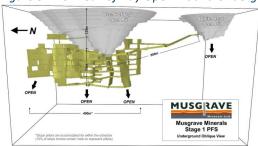

The mining schedule consist of 6 open pits and 1 underground. The average strip ratio across the 6 pits is 15.7. Optimisation on both the underground and open pit have been based on a \$2500/oz gold price. Costing for the underground and open pit has been based on Q1 2023 request for quotes. Production includes approximately 77% indicated and 23% inferred material.

MRE update planned for the end of CY23, with a stage 2 PFS planned for early CY24

Musgrave plans to release an updated MRE at the end of CY23, which will feed into a stage 2 PFS, planned for early CY24. The stage 2 PFS is planned to extend the current stage 1 life of mine, and will consider alternative development options, including toll processing, ore sales, plant lease and different site processing solutions.

All stage 1 PFS deposits are located on 100% MGV owned ground and are on granted mining leases. Mining approvals and permits that are still in progress include:

- Mine Proposal and Mine Closure Plan
- Native Vegetation Clearing Permit
- Premises licenses for dewatering discharge and process plant tailings
- Updated ground water license
- Discharge license for excess water into Lake Austin
- Cultural Heritage Management Plan and Relationship Agreement with BLAC and BBBAC

Argonaut's Mining Scenario and Valuation

Following the release of MGV's PFS, we have updated our modelled mining scenario as a basis for our valuation. Given the breakdown of financial data available in MGV's PFS, we were able to compare previous costs assumptions and calibrate our model to cost estimates provided. In back analysis, MGV's released costs represent an approximate 12% increase on our previous modelled assumptions, which we consider in line with industry costs movements.

Gold price of US\$1850/oz with an exchange rate of \$0.70.

We have updated our internal gold price estimates which average to US\$1850/oz Au across the life of the project. Our AUD to USD currency conversion remains unchanged at \$0.70. This results in an average gold price of A\$2640/oz in comparison to MGV's assumed \$2600/oz.

Assumed real discount rate of 7%

We have decreased our real discount rate to 7% (prior 8%), which we consider more appropriate as we foresee little risk due to the basic operational nature, high grade mineralisation, and tier 1 jurisdiction in which the project is located.

Revised base case model Cue Gold Project as stand-alone project In our revised base case mining scenario, we have re-modelled MGV as a stand-alone operation, in line with MGV's PFS stage 1. While this does provide a base case for our valuation, we do model additional scenarios to determine project value impact.

Our modelled inventory has been adjusted to reflect the inventory MGV has released in the stage 1 PFS. In comparison to our previous model, this includes the addition of Leviticus and Numbers open pits, as well as the addition of the Break of Day underground. This represents a conversion of 37% of MGV's Resource ounces to our modelled mining inventory (previously 43%), or 55koz less when compared to our previous model.

With respect to our previous modelled scenario, we have delayed construction commencement from Q4 CY23 to Q4 CY24.

Assumed 50:50 debt to equity ratio to finance \$120M pre-production capex

Our financing requirements have also been adjusted. We model an assumed \$10M equity raise (at \$0.20) in Q4 CY23 to see the project through to an FID. Upon FID, we model a further \$60M equity raise (at \$0.20) in addition to an assumed \$60M in debt financing (50:50 debt to equity) to fund the project.

Our exploration upside has increased slightly to 25% (prior 20%). We still see this as conservative given the scheduled Amarillo and Waratah MRE updates, in conjunction with other prospective tenements held by MGV.

We have been slightly more conservative with recoveries than MGV, using an average of 96% across the project (MGV PFS1 = 97.8%). It is worth noting that this has a net zero impact when increasing an assumed gold price from \$2600 to \$2640/oz.

Our base case valuation of the Cue Gold Project is \$205M

Our valuation of the Cue gold project is \$205M. As a sum of parts, Argonaut values MGV at \$194M, or \$0.33 per share, including a nominal exploration value of \$54M, corporate overheads, equity dilution and current cash and equivalents.

Our sum of the parts base case valuation for MGV is \$0.33 per share

Figure 5: Argonauts MGV Valuation Summary

Valuation summary	A\$M	A\$/sh
Cue Gold Project 7% real after tax	205	0.35
Exploration - 25%	51	0.09

NAV	194	0.33

Source: Argonaut

At spot prices, our modelled valuation increases to \$0.42.

If we use the current spot price of US\$2022/oz for gold at an exchange rate of 0.68, our valuation of the Cue Gold Project improves to A\$263M, and our MGV valuation increases to \$0.40. A sensitivity analysis of the current gold price ($\pm 10\%$) and USD to AUD exchange rate ($\pm 7\%$) is shown below.

Figure 6: Argonauts Cue Gold project level valuation under varying gold price and exchange rate assumptions.

	3	Gold Price (US\$)					
		-10%	-5%	Base	+5%	+10%

Modified Scenarios

While we expected that Break of Day carried sufficient grade to support an Underground operation, we were curious to see how the project stacks up if no underground mining were to occur. Assuming no reschedule of open pits, and that processing seizes after 4 years, we approximate the Cue Gold Project to be worth \$177M, or \$32M less than our base case. In this scenario, a sum of the parts valuation for MGV results in \$171M, or \$0.29 per share.

We model a theoretical scenario where no Underground mining is undertaken, our Cue Gold Project valuation decreases to \$173M, and our MGV valuation decrease to \$0.29 per share

Figure 7: Argonauts Scenario Valuation Summary - No UG Mining

Valuation summary - No underground mining	A\$M	A\$/sh
Cue Gold Project 7% real after tax	173	0.29
Exploration - 25%	43	0.07
Corporate Overheads	-25	-0.04
Cash and bullion	9	0.01
Debt	0	0.00
Tax benefit	0	0.00
Hedging	0	0.00
Option/equity dilution	-29	-0.05
NAV	170	0.29

Source: Argonaut

We model an alternate scenario where we consider a toll treatment arrangement. Our Cue Gold Project valuation in this scenario increases to \$219M, with our MGV valuation increasing to \$0.38 per share

We also considered a toll treat arrangement. In this scenario, we remove \$80M from preproduction capex requirements, and adjust financing requirements accordingly while maintaining a 50:50 debt to equity ratio. We add an additional 23% to the treatment cost, which may be considered high, but we prefer conservatism given the potential unknown circumstances and risks associated with a toll treatment agreement. We also include surface haulage distances of 150km at a cost of 14c/t/km. Under this scenario, we value the Cue gold project at \$219M (\$14M / 7% more than our base case scenario), with the MGV valuation increasing to \$227M (\$0.38 per share). This valuation remains in line with our previous valuation that modelled toll treating options.

Figure 8: Argonauts Scenario Valuation Summary - Toll treat arrangement

Valuation summary - Toll treat	A\$M	A\$/sh
Cue Gold Project 7% real after tax	219	0.37
Exploration - 25%	55	0.09
Corporate Overheads	-25	-0.04
Cash and bullion	9	0.01
Debt	0	0.00
Tax benefit	0	0.00
Hedging	0	0.00
Option/equity dilution	-30	-0.05
NAV	227	0.38

Key Risks to Valuation

While we consider MGVs optionality with respect to its high-grade deposit located centrally to 3 mills as advantageous, it also has potential to present risk. There is sufficient processing capacity in the area that another, comparatively small mill, should not be required. However, toll treating arrangements, depending on the circumstances in which they are negotiated, are not necessarily favourable, and reconciliation of grade has potential to be at the mercy of the plant operator. While the shallow and high-grade nature of MGVs Cue Gold project may interest nearby parties for a takeover as a quick win to fill their own mill on their own terms, if these parties are in no rush to make a deal, then MGVs optionality may be limited to build, or potentially end up in a holding pattern. To this, the decision for an explorer to transition to a miner should be well considered and a strategised accordingly. Once a miner, expectations turn that a producer needs to continue producing, and to renew depleted reserves. This potentially presents a trap for MGV, with a small mine life and a small mill, centrally located between 3 mills.

As with all new projects, licensing and permitting risks are present. At this stage we foresee minimal risk here given the current project status and time to project commencement.
