

ASX RELEASE

30 APRIL 2018

STRATEGIC LOAN TO BAUXITE DEVELOPER

HIGHLIGHTS

- Strategic loan secures exclusivity over Wagina bauxite project in the Solomon Islands
- Metallica to conduct detailed due diligence ahead of a potential transaction
- Advanced, low capex asset fits identified criteria for growth projects to meet stated goal of increasing production towards 5 to 7 million tonnes of bauxite per annum
- Commencing production at the Urquhart Bauxite project near Weipa remains the prime focus for the Company

Metallica Minerals Limited ([ASX:MLM](#)) (Metallica, or the Company) is pleased to advise that it has entered into a secured loan agreement with South West Pacific Bauxite (HK) Ltd (SWPB), 75% owner of the advanced Wagina bauxite project (Wagina or the Project) in the Solomon Islands.

In exchange for providing the loan, Metallica has been granted an option to carry out exclusive due diligence on Wagina with a view to ultimately completing a transaction involving the Project. Under the agreement, exclusivity extends for the period the loan is outstanding.

Details of the loan are as follows:

Term	Detail
Borrower	South West Pacific Bauxite (HK) Ltd
Amount	AUD 120,000
Term	12 months
Interest Rate	15% per annum
Security	Shares in South West Pacific Bauxite (HK) Ltd

Whilst also progressing its Urquhart Bauxite Project on Queensland's Cape York Peninsula towards production, Metallica has been canvassing growth options that will enable it to increase its production profile towards the previously stated target of 5-7 million tonnes per annum of bauxite, over 3 to 5 years.

The Company's initial assessment of Wagina suggests that the Project meets its criteria as an advanced long-life, low-cost asset that has the potential to deliver significant long term value for shareholders.

Metallica Managing Director, Mr Simon Slesarewich said:

"After an extensive and disciplined search in Australia and overseas, we are excited to have identified the Wagina bauxite project as an asset that is potentially the right fit for the Company. This Project has the ability to significantly extend our current Reserve life and lift the production profile beyond what Urquhart will deliver when it comes online."

"Similar to Urquhart, Wagina has the potential to be developed at a relatively low capital cost and in a manner that could deliver outstanding returns.

"We have been selective with growth opportunities and we intend to be thorough in our due diligence on Wagina as the Solomon Islands is a new jurisdiction for the Company. We look forward to commencing this process and expect to announce the results later this year."

BACKGROUND

The Wagina bauxite project was discovered by CRA (now Rio Tinto) in 1968, with extensive exploration and detailed assessment undertaken thereafter. SWPB, which owns 75% of the Project, has completed significant internal studies on a simple development scenario, under which bauxite would be mined at or near surface, transported to a barge-loading facility and then transhipped in sheltered deep water to large ocean-going vessels approximately 2km away (Figure 1).

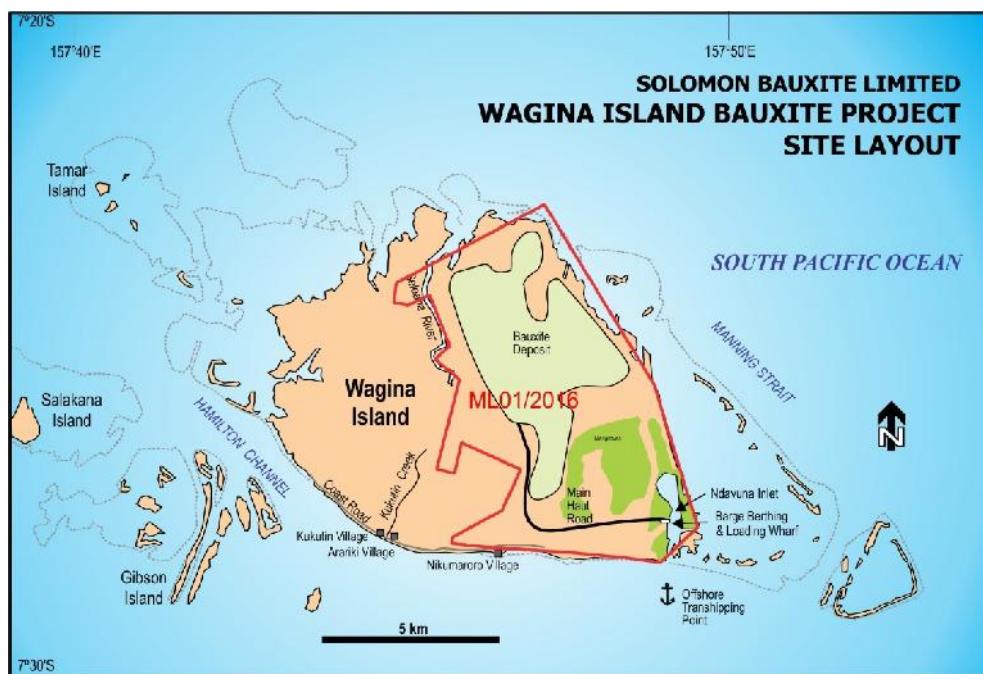

Figure 1 - Conceptual layout of Wagina bauxite project

The studies envisage a mining operation producing 2 to 3 million tonnes of bauxite per annum for more than 10 years. The 30 million tonne bauxite Resource (26.1 Mt Measured, 3.6 Mt Indicated and 0.5 Mt Inferred)¹ is contained within a granted mining lease.

¹ See Table 1 below

Solomon Bauxite Ltd (SBL), a subsidiary of SWPB, has previously entered into a Marketing Agreement with Noble Group (Noble). In return for the rights to market Wagina bauxite, Noble is required to assist in sourcing funding for the Project in accordance with the Marketing Agreement.

Wagina has many similarities, including bauxite quality, to the Direct Shipping Ore (DSO) bauxite operation on Rennell Island (Rennell), also in the Solomon Islands. Rennell commenced exporting bauxite to China in 2014 and in 2017 exported 1.53 million tonnes, receiving up to US\$54.69 per dry tonne delivered (CIF).

The Solomon Islands are attractively located only 10 days shipping to the Chinese market, compared to another emerging global source of bauxite, Guinea in West Africa (approximately 33 days), and has enjoyed peace and stability for more than 15 years, which culminated in the withdrawal of the Regional Assistance Mission to Solomon Islands (RAMSI) last year.

The Solomon Islands Government has identified mining as a key area of economic growth and is supportive of foreign private sector investment and skills transfer in this sector. This strategy is actively supported by the Australian Government through its Aid Investment Plan which has identified enabling economic growth as one of its three key objectives. Metallica has commenced liaising with the Australian High Commission, as well as the Solomon Islands government and other stakeholders, in the capital Honiara.

WAGINA PROJECT

Wagina Island is an island of approximately 78 km² located between Choiseul and Santa Isabel islands in the Choiseul Province of Solomon Islands (Figure 2). The Project is wholly contained on a granted mining lease (ML 01/2016) covering approximately 48 km² on the eastern side of Wagina Island (Figure 1).

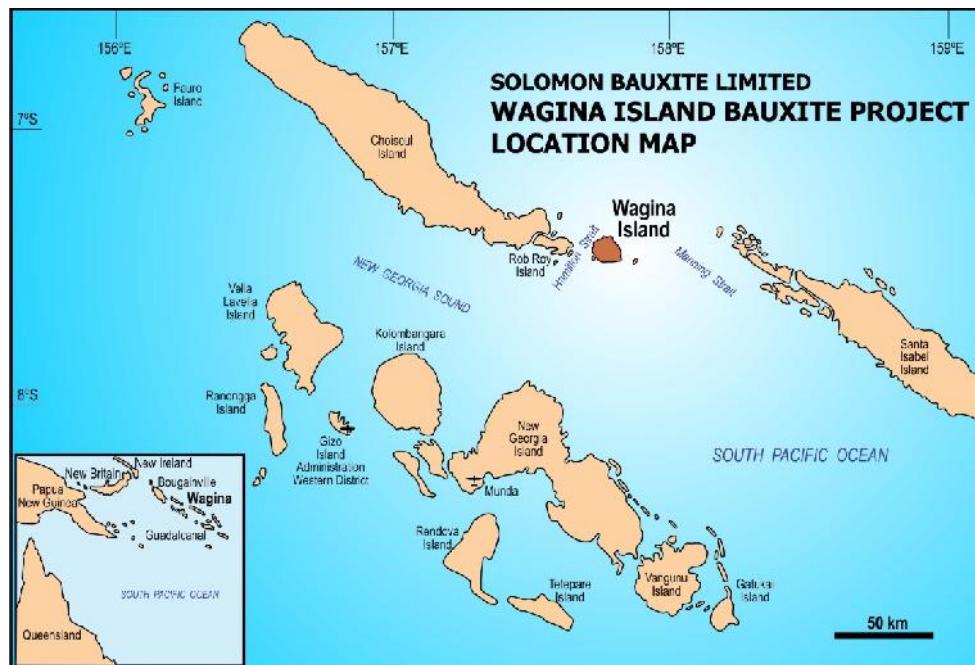

Figure 2 - Location of Wagina Island in the Solomon Islands

The Wagina Island geology is composed of a succession of marine calcareous sediments and raised reef limestone ridges and plateaus. Calcareous sediments, comprised of siltstones and mudstones, form the oldest exposed rocks and occupy much of the western part of the Island. Raised Pleistocene coralline reef limestone overlies the calcareous sediments, predominantly in the southeast, east and northeast regions of the island. Both formations have been deeply weathered, and the resulting laterite forms a mantle over approximately 80% of the island.

Bauxite generally constitutes the upper part of the laterite profile but, in a number of places, particularly over limestone, the total laterite profile is bauxite. The bauxite is a terra rossa type developed mainly over a karst terrain as a result of in-situ weathering of presumed volcanic ash and limestone under high rainfall tropical conditions. Field evidence suggests that the bauxite formed more or less contemporaneously with karst development in the limestone and approximately 90% of the economic grade bauxite has limestone bedrock. The bauxite over calcareous sediments is usually higher in silica and is underlain by a layer of bauxitic clay.

The Wagina Island bauxite deposit was discovered in 1968 by CRA during geological reconnaissance of the then British Solomon Islands Protectorate. Initial scout drilling results were encouraging and, as a result, a mineral resource evaluation program was completed between November 1969 and November 1971. The program included aerial surveys, photo-interpretation, geological mapping, auger drilling, pitting and bauxite profile probing.

Survey control initially consisted of a tape and compass grid, which was surveyed precisely late in the program. A geological mapping program of soils, outcrop, swamp and topographic features was completed along grid lines and combined with photo interpretation to outline swamps and outcrop limits.

Auger drilling was undertaken in two stages. A widely spaced reconnaissance program with holes drilled at 1,000 - 4,000 ft (300 – 1,200 m) centres to outline areas of bauxite; followed by an evaluation drilling program based on a 500 ft (150 m) grid, which in turn was infilled over 90% of the deposit area to 250 ft (75 m) centres. A total of 3,627 auger holes were drilled using a 2 inch (5 cm) diameter screw auger with aluminium extension rods, the majority of auger drill holes did not exceed 9 m with a maximum depth drilled of 41.5 ft (~12.7 m).

Auger drilling was supplemented by probe testing through the bauxite to rock bottom to establish the depth of the bauxite footwall, particularly between widely spaced boreholes.

Twenty three pits were sunk to a maximum 3 m to obtain bulk density data, moisture content data and to provide bulk samples for laboratory test work on the bauxite. The pits were sited to provide a density of four pits per square mile (1 pit per 65 ha) in the main areas of bauxite.

The bauxite was observed to be fine grained, homogenous and quite uniform vertically with no apparent layering or pisolithic texture.

In 2013 SWPB acquired a 75% interest in SBL, which in turn holds 100% of the Project.

In 2013 SWPB engaged Breakaway Mining Services Pty Ltd (BMS) to develop a resource model and JORC 2012 compliant Mineral Resource estimate for the Project.

The Mineral Resource estimate for the Project is 30.1Mt at 46.9% Al_2O_3 , 3.0% SiO_2 , 16.7% Fe_2O_3 and 3.4% P_2O_5 as outlined below.

Classification	Tonnes	Total Al ₂ O ₃	Total SiO ₂	Available ² Al ₂ O ₃	Reactive ² SiO ₂	Total Fe ₂ O ₃	Total P ₂ O ₅
	Dry Mt	%	%	%	%	%	%
Measured	26.1	46.8	3.0	40.4	2.3	16.7	3.5
Indicated	3.6	47.5	2.5	41.8	1.8	16.8	2.6
Inferred	0.5	46.7	3.6	40.3	2.6	16.9	2.7
Total	30.1	46.9	3.0	40.6	2.2	16.7	3.4

Table 1 - Wagina Mineral Resource Estimate (2013)

The 2013 Mineral Resource estimate was completed using the following parameters:

- The resource area extends over a strike length of 7500m from 9180500mN to 9173000mN, with plan widths up to 4,300m from 364000mE to 368300mE and the maximum vertical extent of the interpretation was 9m
 - Drill holes used in the resource estimate comprised 1571 surface auger vertical drill holes for a total of 4,444m of drilling. All holes were drilled by CRA. The resource definition intercepts are tabulated in Appendix B and the drill hole distribution shown in Figure 3.
- Drill hole collars were surveyed in local grid by CRA and the drill hole collar co-ordinates have been digitised from CRA plans.
- Sampling was carried out on geological boundaries with most intervals approximately 1.5m in length unless justified by the geology.
- CRA sample analysis comprised initial validation tests of acid insoluble content were undertaken in a field laboratory in Papua New Guinea. Samples with acid solubility, < 8 %, were composited by hole with the resultant 1,955 samples analysed by x-ray fluorescence (XRF) for major oxides: Al₂O₃, Fe₂O₃, SiO₂ and P₂O₅ at Zinc Corporation laboratory in Broken Hill.
- Samples which returned values above the stated natural cut-off of 42.5% Al₂O₃ were then composited again to form area composite samples of up to 10 holes in a given area. The area composite sample selection criteria included geographical distribution of the drill holes and drill hole sample grades. A total of 303 area composite samples were prepared and analysed by XRF for major oxides (Al₂O₃, Fe₂O₃, SiO₂, P₂O₅, TiO₂, MnO, and CaO) as well as LOI, TAA and quartz at Zinc Corporation Laboratory. A subset of 20 samples were analysed for gibbsite (trihydrate alumina) content at 140 C.
- Check analyses of a selection of drill hole and area composite samples were undertaken at Comalco and AMDEL laboratories. The results indicate that sampling and assaying is of high reliability.
- Wireframes were constructed using drill intercept interpretations based on CRA geology plans.
- Samples within the wireframes were composited per drill hole with up 10 drill holes having the same composited grade within a given resource area.
- Statistical analysis of the bauxite domain was undertaken on 1572 bauxite drill holes with matching collar coordinates.
- The parent block size of 40m NS x 40m EW x 2m vertical with sub-cells of 5m x 5m x 1 m. The parent block size was selected on the basis of being approximately 50% of the average drill hole

² Low temperature digestion

spacing in the deposit. Block Discretisation was set to 4 by 4 by 2. An oriented "ellipsoid" search was used to select data and was based on parameters taken from the variography. The variography was conducted by independent consultants Mining Plus (MP), using Snowdens Supervisor Software. MP comment was "the Variogram models can be fitted with a high degree of confidence over a range of approximately 2000m".

- Using parameters derived from modeled variograms, Ordinary Kriging (OK) was used to estimate average block grades within the bauxite domain using Maptek Vulcan software for 8 elements - available alumina, reactive silica, total Al₂O₃, total SiO₂, Fe₂O₃, P₂O₅, LOI and TiO₂. No high grade cuts were deemed necessary in the estimation. A single bauxite domain was replicated from the CRA polygonal areas from the CRA plans. Grade interpolation was 43.4% of the resource volume filled in the 1st pass (100m), 55.8% in the 2nd pass (200m) and the remainder in the 3rd pass.
- An Inverse Distance (IVD) check estimate in Maptek Vulcan software was carried out by SWPB.
- A bulk density value of 1.063 t/m³ was applied to the mineralised bauxite.
- The Resource is classified as Measured Mineral Resource within areas of drill spacing (75m x 75m) due to the well documented continuity and predictability of the bauxite mineralisation. Areas with less drilling have been classified as Indicated Mineral Resource. Areas with single drill holes have been classified as Inferred Mineral Resource.

Competent Person's Statement

The information in this report that relates to Exploration Results and Exploration Targets is based on information compiled by Dr Andrew White (a geologist of over 50 years experience), and a Competent Person who is a Fellow of the Australian Institute of Geoscientists, a Consulting Geologist employed by Andrew White and Associates Pty Ltd (AWA) and is a contract consultant to South West Pacific Bauxite Ltd. Dr Andrew White has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Dr Andrew White consents to the inclusion of this information in the form and context in which it appears in this release/report.

The Mineral Resource estimate was undertaken by Mr Geoff Reed, (a geologist of over 20 years experience), who is a Member and Chartered Professional of the Australasian Institute of Mining and Metallurgy and is a Consulting Geologist employed by Breakaway Mining Services Pty Limited. Mr Geoff Reed has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Geoff Reed consents to the inclusion of this information in the form and context in which it appears in this release/report.

Caution regarding Forward Looking Statements

Certain statements made in this announcement contain or comprise certain forward-looking statements. Although Metallica believes that the estimates and expectations reflected in such forward-looking statements are reasonable, no assurance can be given that such expectations will prove to have been correct. Accordingly, results could differ materially from those set out in the forward-looking statements as a result of, among other factors, changes in economic and market conditions, success of business and operating initiatives, changes in the regulatory environment and other government actions, fluctuations in commodity prices and exchange rates and business and operational risk management. Metallica undertakes no obligation to update publically or release any revisions to these forward-looking statements to reflect events or circumstances after today's date or to reflect the occurrence of unanticipated events.

Appendix A - JORC CODE, 2012 EDITION – TABLE 1 DESCRIPTIONS

Section 1 Sampling Techniques and Data

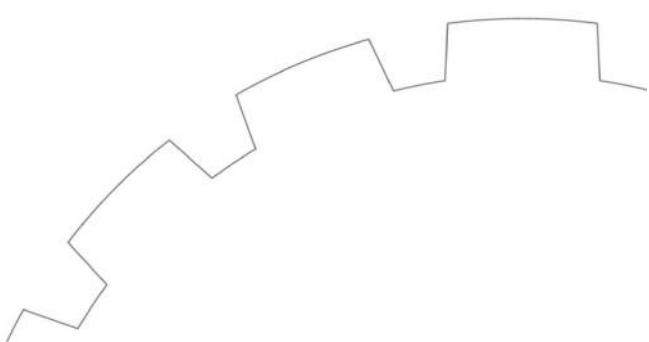

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<p><i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></p> <p><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></p> <p><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></p> <p><i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></p>	<p>This announcement covers the potential acquisition by Metallica Minerals (MLM) of the Wagina Bauxite Project from Southwest Pacific Bauxite (SWPB) having been granted an option to carry out exclusive due diligence on Wagina with a view to ultimately completing a transaction involving the Project.</p> <p>In 2013 SWPB completed a JORC 2012 Mineral Resource estimate for the Wagina Island project.</p> <p>Auger drilling and pitting conducted between 1969 – 1971 by CRA (a previous leaseholder) was reviewed and the results form the basis for the resource estimate by SWPB.</p> <p>No new drilling or sampling is included in this announcement.</p> <p>Drilling was carried out with a 2 inch (~5 cm) diameter screw auger with aluminium extension rods. Drilling advanced in 6 in (~15cm) runs with the auger being cleared after each run. The surface organic layer, generally the top one foot (~30 cm), was removed from each hole and augering continued to bedrock or material below bauxite or to a maximum depth of 27 ft (~9 m). A single hole was drilled to 41.5 ft (~12.7 m).</p> <p>The recovered cuttings were laid out on plastic sheets and logged. If no significant compositional change was noted the material was sampled in 5 ft (~1.5 m) intervals. If change was noted the cuttings were divided into samples at the point of change.</p> <p>The whole of each sample was placed in a pre-numbered linen sample bag. Samples were dried on a hotplate, generally over a 24hr period dependant on the moisture content, before being cooled, pulverised using a pestle and mortar and reduced by cone and quartering to approximately 200-250 grams which was retagged with the original sample number. Rejects were returned to the original bag and stored for reference.</p>
<i>Drilling techniques</i>	<p><i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></p>	<p>Auger drill holes were used to obtain samples of bauxite for reconnaissance and detailed evaluation of the deposits.</p> <p>A total of 3,627 auger holes were drilled for a total depth of 33,225 ft (~10,127 m). Drilling was carried out with a 2 inch (~5 cm) diameter screw auger with aluminium extension rods, the maximum depth drilled being 27 ft (~9 m). A single hole was drilled to 41.5 ft (~12.7 m). Drilling advanced in 6 in (~15cm) runs.</p> <p>The drill crew consisted of three local labourers with one supervisor. The average drilling rate was 12 m per day per drilling crew.</p>
<i>Drill sample</i>	<i>Method of recording and assessing core</i>	Details of individual drill hole sample recovery from the auger

Criteria	JORC Code explanation	Commentary
<i>recovery</i>	<p><i>and chip sample recoveries and results assessed.</i></p> <p><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></p> <p><i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></p>	<p>drilling was not located by SWPB during their data review for the resource estimate.</p> <p>CRA reports that the auger was cleared after each 6 in (~15 cm) run and states that actual recoveries from the auger drilling were >90%.</p>
<i>Logging</i>	<p><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></p> <p><i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i></p> <p><i>The total length and percentage of the relevant intersections logged.</i></p>	<p>Auger drill holes were field logged by CRA with the data collected including hole number, local grid coordinates, sample number, depth from to, and geology description. The geology description logged the colour, nature and physical properties of the bauxite and footwall geology.</p> <p>Auger drill holes were sampled in 5 ft (~1.5 m) intervals unless i) a compositional change was noted in the logging and then the drill cuttings were divided into samples at the point of change, or ii) the bauxite interval was less than 5 ft (~1.5m).</p>
<i>Sub-sampling techniques and sample preparation</i>	<p><i>If core, whether cut or sawn and whether quarter, half or all core taken.</i></p> <p><i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i></p> <p><i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i></p> <p><i>Quality control procedures adopted for all sub-sampling stages to maximize representivity of samples.</i></p> <p><i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i></p> <p><i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i></p>	<p>Sampling procedures for the CRA auger drilling were reviewed by SWPB and assessed as accurate for the type of work undertaken.</p> <p>No sub-sampling of material was undertaken at the time of collection. The entire volume of each sample of logged bauxite was collected at the drill site.</p> <p>Samples were dried at camp and then pulverised using a pestle and mortar and reduced by cone and quartering to approximately 200-250 grams which was retagged with the original sample number. Rejects were returned to the original bag and stored for reference. Samples were despatched for analysis to Goroka Laboratory, PNG.</p> <p>At Goroka the samples were prepared for analysis by:</p> <ul style="list-style-type: none"> • drying at 110 C in an electric oven for 24 hrs then cooled; • crushed in an 8 in Van Gelder disc mill to ~100 mesh and then split using a 1/8" riffle splitter to produce an 80 gm original and a duplicate sample and the residue retained; • after each sample the disc mill and riffle splitter were cleaned with compressed air. <p>On the basis of the results from the initial Goroka Laboratory analyses CRA prepared hole composite and area composite samples which were assayed at Zinc Corporation Laboratory in Broken Hill, NSW.</p> <p>These samples were prepared for analysis by:</p> <ul style="list-style-type: none"> • sample weighting according to the hole interval represented by the sample; • the composite sample was then passed through an 80 mesh sieve to break-up any lumps and split using

Criteria	JORC Code explanation	Commentary
		<p>a 1/8" riffle splitter to produce an 75 gm sample; The balance of the original drill hole samples were retained and stored.</p>
Quality of assay data and laboratory tests	<p><i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></p> <p><i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></p> <p><i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i></p>	<p>Initial sample validation tests were carried out at Goroka Laboratory in Papua New Guinea for acid insoluble (Al) content. The Al test determines the acid insoluble fraction of the bauxite sample and is used as a guide to bauxite quality. Acid Insoluble content was considered a conservative measure of total silica.</p> <p>Samples were prepared by:</p> <ul style="list-style-type: none"> • sulphuric acid digestion of 1 gm of sample to transform the metal salts to sulphates; • the sulphates are dissolved in water and filtered before ammonium nitrate is added to aid the digestion of the sample; • resultant material is then transferred to a filter paper which is heated to drive off any residual moisture; • the filter paper is then ignited to 1050 °C for 30 min and the residue weighed to determine the Al percentage. <p>Samples with high acid solubility, defined as an Al less than 8%, were then subjected to further analysis at Zinc Laboratory, Broken Hill, NSW laboratory. Samples that met the criteria acid solubility test were composited on a weighted interval basis by hole (Hole Composites or HC). A total of 1,955 samples were analysed:</p> <ul style="list-style-type: none"> • by XRF for major oxides; Al_2O_3, Fe_2O_3 and P_2O_5; • for Moisture Content by drying 1 gram of sample at 105 °C for 4 hrs • for Loss on Ignition (LOI) by heating the residue from the Moisture Content sample to 1000 °C for one hour; • for Reactive Silica by determining the quartz content and deducting this from the Total SiO_2 content; • for Total Available Alumina (TAA) by digesting a 10 gram sample with caustic at 180 °C in a stainless steel bomb and then using the determined moisture content of the sample to correct to dry weight. <p>CRA subsequently had Zinc Corporation laboratory prepare Area Composites (AC) where up to ten hole composites above a cut-off grade of 42.5% total Al_2O_3 were composited on a weighted interval basis for further analysis. The AC groupings were based on geographical proximity for the outer or isolated deposits and by grade continuity of mineralisation in major continuous deposits where HC's with an approximate range of 2% total alumina were grouped together.</p> <p>A total of 303 area composites were analysed at Zinc Corporation, Broken Hill, NSW laboratory:</p> <ul style="list-style-type: none"> • by XRF for major oxides (Al_2O_3, Fe_2O_3, SiO_2, P_2O_5, TiO_2, MnO, and CaO); • for Loss on Ignition (LOI); • for total available alumina and reactive silica; and. • For Trihydrate Alumina by digesting a 20 gram sample with caustic at 140 °C in a stainless steel bomb and then using the determined moisture content of the sample to correct to dry weight <p>No Certified standards or blanks were reported by CRA as</p>

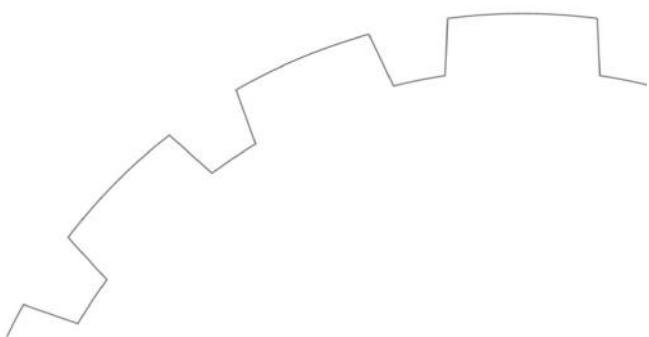

Criteria	JORC Code explanation	Commentary
		<p>having been used during the program.</p> <p>A radiometrics geophysical survey was carried out as part of the CRA initial prospect discovery process.</p>
<i>Verification of sampling and assaying</i>	<p><i>The verification of significant intersections by either independent or alternative company personnel.</i></p> <p><i>The use of twinned holes.</i></p> <p><i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i></p> <p><i>Discuss any adjustment to assay data.</i></p>	<p>CRA completed a series of check analysis programs including:</p> <ul style="list-style-type: none"> • on the Goroka Laboratory Al analyses - 73 samples were reanalysed for Al and CRA reported that no samples showed an unacceptable variation. • comparison of the Goroka Laboratory Al results and Zinc Corporation XRF results for samples from 16 holes; • check analysis of XRF results from 79 Hole Composite samples assayed at Zinc Corporation Laboratory; • additional check analyses and comparison of 20 Zinc Corporation Hole Composite sample analysis by AMDEL and Comalco Ltd and a further 51 Zinc Corporation Hole Composites by Comalco Ltd; and • 20 Area Composite samples were assayed for Al_2O_3, Fe_2O_3, SiO_2, P_2O_5, TiO_2, MnO, Reactive Silica, Total Available Alumina and LOI by Zinc Corporation, Comalco and Amdel with the results reported by CRA as being in fair agreement. <p>CRA reported that the check assaying and check sampling programs indicate that the results are acceptable.</p>
<i>Location of data points</i>	<p><i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i></p> <p><i>Specification of the grid system used. Quality and adequacy of topographic control.</i></p>	<p>Drill hole collars were originally located at the time of drilling on a local grid. Survey of the auger hole grid was initially by tape and compass oriented on a north-south bearing. Later in the evaluation program this grid was surveyed with a specified accuracy of 1 in 1,000 horizontal and +/- 6 ins (-15 cm) vertical for drill hole collars. The datum for levelling was high tide watermark based on tide readings over a six month period at several points across the island. All drill holes are vertical with no down hole surveys.</p> <p>SWPB digitised the drill hole collar co-ordinates from CRA plans from 1969-1971 using the grid system WGS84 UTM57.</p> <p>Accurate LiDar topography was flown over the project area in 2014 by SWPB in order to provide more accurate data for future resource modelling, mine planning and infrastructure planning purposes.</p>
<i>Data spacing and distribution</i>	<p><i>Data spacing for reporting of Exploration Results.</i></p> <p><i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></p> <p><i>Whether sample compositing has been applied.</i></p>	<p>Initial reconnaissance auger drilling on Wagina Island was undertaken in 1969 on a nominal 1,000 ft (~300 m) grid with some 1,000 x 4,000 ft spacings. Between 1969 - 1971 CRA followed up areas of identified bauxite mineralisation with auger drilling on a 500 ft (~150 m) grid and then on a 250 ft (~75 m) grid in areas where the earlier drilling identified that the bauxite was not uniformly distributed in areal extent or in thickness. The infill drilling confirmed the results of the reconnaissance drilling and extended the areal extent and depth of mineralisation in places.</p> <p>The SWPB Mineral Resource estimate classification reflects the confidence in the continuity of the mineralisation. The Resource is classified as Measured Mineral Resource within areas of reasonable drill spacing (~75m x ~75m) due to the well documented continuity and predictability of the bauxite mineralisation. Areas with less drilling have been classified as Indicated Mineral Resource. Areas with single drill holes have been classified as Inferred Mineral Resource.</p>

Criteria	JORC Code explanation	Commentary
		<p>Auger drill holes were sampled in 5 ft (~1.5 m) intervals unless i) a compositional change was noted in the logging and then the drill cuttings were divided into samples at the point of change, or ii) the bauxite interval was less than 5 ft (~1.5m). Following the initial Al analyses individual hole sample intervals which returned < 8% Al were composited into Hole Composites and analysed by XRF for Total Al₂O₃, Total SiO₂, Fe₂O₃ and P₂O₅. Further cut-offs were then applied, with acceptable bauxite defined as having a minimum thickness of 3 feet (~0.9m) and greater than 42.5% total alumina content (statistical studies indicated this grade was a 'natural cut-off'). Bauxite samples in adjacent holes (up to a maximum of 10 holes) above these cut-off criteria were then composited on a weighted footage basis for detailed analysis. A total of 303 area composites were analysed in detail and the results used in the Mineral Resource estimation.</p>
<i>Orientation of data in relation to geological structure</i>	<p><i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralized structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></p>	<p>The mineralisation is regarded as horizontal due to the tabular nature of the style of deposit. All drill holes were less than or equal to 27 ft (~9 m) in length (A single hole was drilled to 41.5 ft (~12.7 m)), vertical and intersected the mineralisation at an approximate 90° angle, perpendicular to the mineralisation with all intercepts regarded as having True Width. Considering the deposit type the sampling has shown the presence of broad zones of continuity of mineralisation in an unbiased manner.</p>
<i>Sample security</i>	<p><i>The measures taken to ensure sample security.</i></p>	<p>Samples for analysis were packed in sealed (soldered) metal containers and despatched for analysis along with copies of drill hole logs showing hole number, sample number and sample interval.</p>
<i>Audits or reviews</i>	<p><i>The results of any audits or reviews of sampling techniques and data.</i></p>	<p>SWMP conducted an internal review of the sampling techniques and data as part of its Mineral Resource estimation and concluded an audit or review of the drilling procedures would be highly recommended. No external audits or reviews have been conducted. Metallica Minerals is currently reviewing all historical data as part of their assessment of the project.</p>

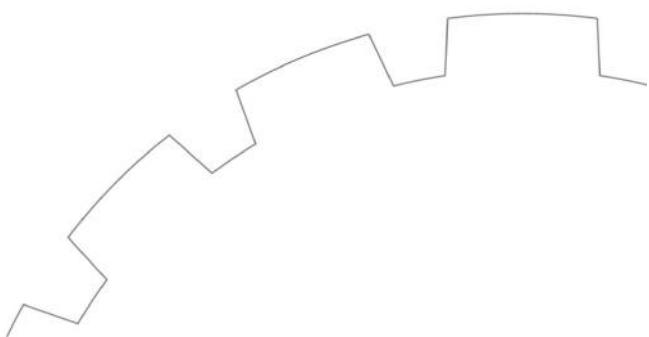

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<p><i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i></p> <p><i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i></p>	<p>The Project is held by Solomon Bauxite Ltd (SBL), a company incorporated in the Solomon Islands, under a 25 year mining licence ML01/2016 covering approximately 48 km² on the eastern side of Wagina Island. SBL is in turn owned by Southwest Pacific Bauxite (HK) Ltd (SWPB) with a 75% interest and the Lasmos Group, made up of local Solomon Island contacts, which hold the remaining 25% interest.</p> <p>A Surface Access Agreement dated 1 September 2014 between the Commissioner of Lands, representing the Solomons Island Government and Solomon Bauxite Limited was granted to the Company to conduct mining for the period of the mining lease.</p> <p>A Memorandum of Understanding between SBL and the Volekana Tribe (the customary owners) is in place.</p> <p>A Memorandum of Understanding between SBL and the Residents of Wagina is under negotiation.</p>
<i>Exploration done by other parties</i>	<i>Acknowledgment and appraisal of exploration by other parties.</i>	<p>An appraisal has been undertaken of previous exploration for bauxite on Wagina Island. Available records show that in 1967 British Solomon Islands Protectorate Geological Survey geologists visited the southern part of the island and noted the occurrence bauxite which at the time was not considered to be economic. In 1968 geologists from CRA visited and on the basis of ground inspection and airborne scintillometer survey results rated the island as having potential to host a small to medium sized economic bauxite deposit and recommended that scout drilling be undertaken. CRA commenced that program in 1969 which led to a mineral resource evaluation program being completed between 1969 – 1971. That work included aerial surveys, photo-interpretation, geological mapping, auger drilling, pitting and basement depth probing. The historical resource estimate by CRA in 1972 was 27.9Mt (million dry long tons) at 47.1% Al₂O₃, 3.0% SiO₂, 16.7% Fe₂O₃ and 3.3% P₂O₅.</p>
<i>Geology</i>	<i>Deposit type, geological setting and style of mineralization.</i>	<p>Wagina Island is composed of a succession of marine calcareous sediments and raised reef limestone ridges and plateaus. Calcareous sediments, comprised of siltstones and mudstones, form the oldest exposed rocks and occupy much of the western part of the island. Raised Pleistocene coralline reef limestone overlies the calcareous sediments, predominantly in the southeast, east and northeast regions of the island. Both formations have been deeply weathered, and the resulting laterite forms a mantle over approximately 80% of the island.</p> <p>Bauxite generally constitutes the upper part of the laterite profile but, in a number of places, particularly over limestone, the total laterite profile is bauxite. The bauxite is developed mainly over a karst terrain as a result of in-situ weathering of presumed volcanic ash and limestone under high rainfall tropical conditions. Field evidence suggests that the bauxite formed more or less contemporaneously with karst development in the limestone and approximately 90% of the economic grade bauxite has limestone bedrock. The bauxite over calcareous sediments is usually higher in silica and is underlain by a layer of bauxitic clay.</p>

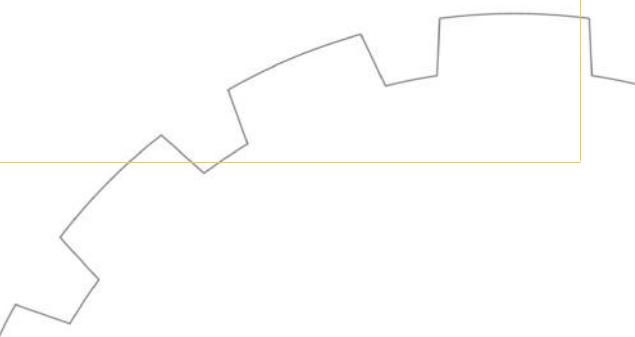

Criteria	JORC Code explanation	Commentary
Drill hole Information	<p><i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i></p> <ul style="list-style-type: none"> <i>easting and northing of the drill hole collar</i> <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>dip and azimuth of the hole</i> <i>down hole length and interception depth</i> <i>hole length.</i> <p><i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i></p>	<p>Individual drill hole collar location with significant intersection composite data is included in a table within this announcement.</p> <p>CRA drilled a total of 3,627 vertical auger holes for a total of 33,225 ft (~10,127 m). Of these 1,733 were included in the CRA defined resource area.</p> <p>All auger drill hole data and validated drill hole results, were used by SWPB to support the Mineral Resource model. The SWPB model is based on 1,572 verifiable positive sample auger drill holes and the resource classification reflects this data.</p>
Data aggregation methods	<p><i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i></p> <p><i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></p> <p><i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></p>	<p>Individual drill hole collar location with significant intersection composite data is included in a table within this announcement.</p> <p>In their reporting of drilling data and resource estimation SWPB note that samples included in hole composite (HC) samples were selected on the basis of individual sample results of Al <8% and that hole composite samples included in area composite (AC) samples were selected on the basis of hole composite sample results having a minimum thickness of 3 feet (~0.9m) and greater than 42.5% total alumina content. Both the HC and the AC samples were composited on a weighted interval basis</p> <p>No metal equivalents were calculated</p>
Relationship between mineralization widths and intercept lengths	<p><i>These relationships are particularly important in the reporting of Exploration Results.</i></p> <p><i>If the geometry of the mineralization with respect to the drill hole angle is known, its nature should be reported.</i></p> <p><i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg ‘down hole length, true width not known’).</i></p>	<p>The mineralisation is regarded as horizontal due to the tabular nature of the style of deposit and because the holes are shallow (generally up to 9 m in depth with a single hole drilled to a depth of 41.5 ft (~12.7 m), drill hole deviation would be minimal and therefore the holes are considered vertical with all intercepts representing True Width.</p>
Diagrams	<p><i>Appropriate maps and sections (with scales) and tabulations of intercepts should</i></p>	<p>Diagrams are referenced in the body of the text.</p> <p>The resource definition auger drill hole intercepts are tabulated</p>

Criteria	JORC Code explanation	Commentary
	<i>be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	in Appendix B.
<i>Balanced reporting</i>	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	Individual drill hole collar location with significant intersection area composite data is tabulated in Appendix B within this announcement.
<i>Other substantive exploration data</i>	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	<p>Other exploration activities included:</p> <ul style="list-style-type: none"> • aerial surveys – a radiometric survey identified significant anomalies corresponding to high grade bauxite and low responses associated with non-bauxitic soils and swamps; • mapping – was completed along grid lines using tape measurements and included in-situ, sub-outcrop and float geology, topography and physical features; • Watertable measurements – downhole watertable depths were recorded during drilling and a monitoring program of 57 drill holes implemented; • pitting - Twenty three pits were sunk to a maximum 3 m to obtain bulk density data, moisture content data and to provide bulk samples for laboratory test work on the bauxite. The pits were sited to provide a density of four pits per square mile (1 pit per 65 ha) in the main areas of bauxite; and • basement depth probing - auger drilling was supplemented by probe testing with a 5m, 3/8th inch (9.5mm) diameter steel reinforcing rod. This rod was pushed by hand through the bauxite to rock bottom to establish the bottom contours of the bauxite, particularly between widely spaced boreholes.
<i>Further work</i>	<p><i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></p> <p><i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i></p>	The Wagina Island project is currently under review by Metallica Minerals Ltd.

Section 3 Estimation and Reporting of Mineral Resources

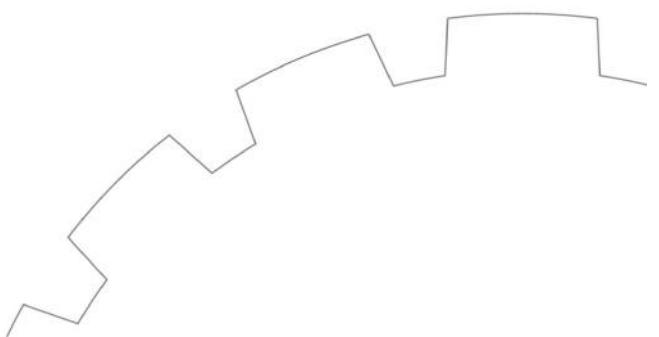

Criteria	JORC Code explanation	Commentary
<i>Database integrity</i>	<p><i>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</i></p> <p><i>Data validation procedures used.</i></p>	<p>SWPB completed a systematic compilation of all previous data available from CRA reports, including drill hole location, sample positions/sample id, and assays, into a relational database in 2012-2013. This database was subsequently imported into Vulcan where in-program database tools were used to cross-check and validate the data which was then used to support the Mineral Resource estimate.</p>
<i>Site visits</i>	<p><i>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</i></p> <p><i>If no site visits have been undertaken indicate why this is the case.</i></p>	<p>The Competent Person, Geoff Reed from BMS, visited the Project in June 2012 to inspect the project area and collect validation bulk samples.</p>
<i>Geological interpretation</i>	<p><i>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</i></p> <p><i>Nature of the data used and of any assumptions made.</i></p> <p><i>The effect, if any, of alternative interpretations on Mineral Resource estimation.</i></p> <p><i>The use of geology in guiding and controlling Mineral Resource estimation.</i></p> <p><i>The factors affecting continuity both of grade and geology.</i></p>	<p>The bauxite horizon is identifiable in drill hole samples. Assaying has confirmed the logging. Geological mapping and drilling have confirmed clear geological structure resulting in generally continuous, robust surface wireframes and grids. The lithology for this deposit is well defined and consistent with thinner and/or lower grade zones attributed to regional variations in the limestone footwall karst form. Maximum depth of auger sampling was 9m and karst depressions deeper than this were not sampled.</p>
<i>Dimensions</i>	<p><i>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.</i></p>	<p>The Wagina Island resource area extends over a strike length of 7,500m from 9173000mN to 9180500mN, with plan widths up to 4,300m from 364000mE to 368300mE and the maximum vertical extent of the interpretation was 9m.</p>
<i>Estimation and modelling techniques</i>	<p><i>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</i></p> <p><i>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</i></p> <p><i>The assumptions made regarding recovery</i></p>	<p>Using parameters derived from modeled variograms, Ordinary Kriging (OK) was used to estimate average block grades within the bauxite domain using Maptek Vulcan software for 8 elements - available alumina, reactive silica, total Al₂O₃, total SiO₂, Fe₂O₃, P₂O₅, LOI and TiO₂. No high grade cuts were deemed necessary in the estimation. A single bauxite domain was replicated from the CRA polygonal areas from the CRA plans. Grade interpolation was 43.4% of the resource volume filled in the 1st pass (100m), 55.8% in the 2nd pass (200m) and the remainder in the 3rd pass.</p> <p>No previous mining activity has taken place at Wagina. An Inverse Distance (IVD) check estimate in Maptek Vulcan software was carried out by SWPB.</p> <p>A previous historical polygonal resource estimate by CRA in 1972 was 27.9Mt (million dry long tons) at 47.1% Al₂O₃, 3.0% SiO₂, 16.7% Fe₂O₃ and 3.3% P₂O₅. Reporting of the updated Mineral Resource is consistent with the previous historical polygonal resource estimate by CRA reported at Wagina.</p> <p>It is assumed that there will be no by-products recovered from</p>

Criteria	JORC Code explanation	Commentary
	<p><i>of by-products.</i></p> <p><i>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</i></p> <p><i>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</i></p> <p><i>Any assumptions behind modelling of selective mining units.</i></p> <p><i>Any assumptions about correlation between variables.</i></p> <p><i>Description of how the geological interpretation was used to control the resource estimates.</i></p> <p><i>Discussion of basis for using or not using grade cutting or capping.</i></p> <p><i>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</i></p>	<p>the mining of bauxite. The non-grade elements are Fe₂O₃ and TiO₂. The deleterious elements estimated are reactive silica, Total SiO₂ and LOI.</p> <p>The parent block size of 40m NS x 40m EW x 2m vertical with sub-cells of 5m x 5m x 1 m. The parent block size on the basis of being approximately 50% of the average drill hole spacing in the deposit. Block Discretisation was set to 4 by 4 by 2. An oriented "ellipsoid" search was used to select data and was based on parameters taken from the variography. The variography was conducted by independent consultants Mining Plus (MP), using Snowdens Supervisor Software. MP comment was "the Variogram models can be fitted with a high degree of confidence over a range of approximately 2000m".</p> <p>No assumptions were made on selective mining units.</p> <p>No assumptions were made about correlation between variables</p> <p>A three step process was used to validate the model.</p> <p>SWPB completed an assessment by slicing sections through the block model in positions coincident with drilling.</p> <p>SWPB compared the average grade of the composite file input against the block model output for the bauxite domain. Thirdly SWPB produced validation plots showing good correlation between the composite grades and the block model grades.</p>
<i>Moisture</i>	<p><i>Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.</i></p>	<p>Tonnages were estimated on a dry basis.</p> <p>Moisture determinations were completed in triplicate:</p> <ul style="list-style-type: none"> • on site through percentage loss in weight on drying over fire generated heat at an uncontrolled temperature (averaging 33.08%); • at Goroko laboratory, PNG by drying 50 grams of material for 12 hours at 150 °C (averaging 35.26%); and • at Zinc Corporation laboratory, Broken Hill, Australia by drying 200 grams of material for 17.5 hours in an electric oven at 150 °C (averaging 32.72%) <p>The average of these results was used in estimations.</p>
<i>Cut-off parameters</i>	<p><i>The basis of the adopted cut-off grade(s) or quality parameters applied.</i></p>	<p>Cut-Offs were applied, with acceptable bauxite defined as having greater than 42.5% total alumina content and a minimum thickness of 3 feet (~0.9m) .</p>
<i>Mining factors or assumptions</i>	<p><i>Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this</i></p>	<p>No assumptions were made regarding possible mining methods or dilution factors.</p> <p>The bauxite horizon is overlain by a layer of humus rich spoil which is typically around 30cm deep</p> <p>The resource presents as a tabular zone that should be able to be mined with industry standard open pit mining practices.</p> 

Criteria	JORC Code explanation	Commentary
	<i>should be reported with an explanation of the basis of the mining assumptions made.</i>	
<i>Metallurgical factors or assumptions</i>	<i>The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.</i>	Available alumina and reactive silica analyses have been completed and are included in the Mineral Resource estimate.
<i>Environmental factors or assumptions</i>	<i>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</i>	Due to the early stage nature of the programs completed on the Wagina Island project the main environmental assumption was that mining is likely to result in bauxite in suspension in mine waters. Test work carried out by SWPB indicates that the bauxite in suspension in mine water can readily be cleaned by high speed centrifuging.
<i>Bulk density</i>	<i>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples. The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</i>	In situ density calculations were assessed by two methods <ul style="list-style-type: none"> • Cubication – 21 pits were sunk to a depth of 10 ft or bedrock at a density of 4 pits per square mile. Samples comprise of a measured cubic foot of bauxite each 2 ft interval cut out as a block measuring 6 x 1 ft x2 ft. Each sample was weighed to obtain in-situ density and then broken up into loosely compacted form within a calibrated container and the volume of loosely compacted material measured and recorded. The sample is retained for moisture determination; and • Undisturbed Core Cutters tests where a steel cylinder of known weight and internal volume is forced into the pit sidewall until completely sunk. The cutter is then removed and the ends trimmed and the whole weighed. The ends of the cylinder are sealed and the

Criteria	JORC Code explanation	Commentary
	<i>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</i>	sample retained for moisture determination. The average of all of the results from both methods was used in the tonnage calculations.
<i>Classification</i>	<p><i>The basis for the classification of the Mineral Resources into varying confidence categories.</i></p> <p><i>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</i></p> <p><i>Whether the result appropriately reflects the Competent Person's view of the deposit.</i></p>	Classification of the Mineral Resource estimate by SWPB was based upon drill hole spacing, confidence in the geological interpretations, the continuity of the bauxite domain and confidence in the bulk density values assigned. Based on these factors the Resource is classified as 'Measured' within areas of reasonable drill spacing (75m x 75m) due to the well-documented continuity and predictability of the bauxite mineralisation. Areas with less drilling have been classified as 'Indicated', while areas with single drill holes have been classified as 'Inferred'. Resources in these categories represent isolated pockets of economic grade bauxite. A small proportion of 'Indicated and Inferred' category resources are in the western part of the Island and are not covered by tenure.
<i>Audits or reviews</i>	<i>The results of any audits or reviews of Mineral Resource estimates.</i>	There has been no documented external review of the resource estimate. Metallica Minerals will conduct internal reviews of the estimates as part of its review of the project and prior to carrying out additional drilling or resource estimation work.
<i>Discussion of relative accuracy/ confidence</i>	<p><i>Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate. The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</i></p> <p><i>These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</i></p>	The Mineral Resource was considered by SWPB to represent a global resource for the Measured, Indicated and Inferred Mineral Resource estimations. The relative accuracy and confidence of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the 2012 JORC Code. The deposit has not previously been mined and is not currently being mined.

Appendix B – WAGINA PROJECT RESOURCE DRILL HOLE TABLE
