

## ASX ANNOUNCEMENT

12 June 2018

### **New Copper-Gold Targets Expand Copper Blow**

- **Copper Blow forms part of a much larger mineralised system**
- **Surveys outline multiple new copper-gold targets**
- **Geophysics indicates an extensive hydrothermal system with potential to host large scale copper-gold mineralisation**
- **Surface geochemistry similar to Copper Blow**
- **Potential for new style of mineralisation including hematite and intrusion-related copper-gold mineralisation**

**Silver City Minerals Limited (ASX: SCI) (“Silver City” or “the Company”)** is pleased to announce results of three dimensional modelling of induced polarisation (IP) geophysical data at Copper Blow located 20 kilometres south of Broken Hill.

Results suggest that copper-gold mineralisation associated with a magnetite-rich shear zone at Copper Blow is only part of a much larger zone of hydrothermal alteration which has potential to host significant copper-gold mineralisation.

Rock chip sampling of new anomalies show they have a similar geochemical signature to Copper Blow.

The North and South mineralised zones which have been the focus of SCI drilling, form the north-western margin of a large zone of anomalism which has a circular appearance in plan view and is approximately one kilometre in diameter (Figure 1). Analytical results for seven drill holes completed in the last month are pending.

This large area of elevated IP chargeability is poorly exposed at surface and has never been drill tested.

#### **Background**

In a recent ASX release (2 May 2018) the Company reported on results of an IP survey and presented a map of chargeability based on a gradient array IP configuration. New zones of anomalous chargeability not associated with magnetite were noted. The Company suggested these might be responding to sulphide mineralisation associated with hematite, a non-magnetic iron oxide.

In addition to the gradient array survey, a limited trial using a different configuration (dipole-dipole) was surveyed over known mineralisation where hole 18CB054 had returned an intersection of **41.2 metres at 1.3% copper and 0.40 g/t gold from 183.8 metres in hole 18CB054 including 7 metres at 2.0%**

**copper and 0.99 g/t gold from 189 metres and 7 metres at 2.0% copper and 0.48 g/t gold from 208 metres** (ASX Release 22 February 2018; Plate 1). Hole 18CB055, located 50 metres to the northeast of 18CB054 was drilled subsequent to the IP survey. This confirmed the presence of copper-gold mineralisation and returned an intersection of **61 metres at 0.7% copper and 0.14 g/t gold from 184 metres** (ASX Release 28 May 2018).

The single survey line of dipole-dipole IP responded well to known mineralisation with elevated chargeability. The response measured during the survey is attributed to the sulphide content of the rocks such that higher chargeability corresponds to higher sulphide content.

Modelling with gradient array data is normally ineffective in creating 3D models, however incorporating this data with the dipole-dipole data enabled better definition and construction of a model.

The model is preliminary and more survey work is required to refine it. However the model presented here outlines an area larger than the drilled mineralisation at Copper Blow, which has potential to host copper-gold (cobalt) mineralisation. The Company intends to pursue these with follow-up exploration, including drilling.

## **Results**

### *Chargeability*

The chargeability map presented in Figure 1 is a horizontal slice (in plan view) of the 3D model located at approximately 180 metres below surface. It shows a distinctive curvilinear chargeability anomaly over 1 km long associated with known mineralisation at Copper Blow where most drilling has taken place (deep orange colours in Figure 1). The interpretation suggests that it highlights elevated copper and iron sulphides in the North and South Zones at Copper Blow.

This zone is also a strong magnetic anomaly and drilling indicates that copper-gold mineralisation is largely hosted in magnetite-rich rocks. This anomaly joins with two additional anomalies ("A" and "B") of similar intensity 380 and 250 metres respectively to the southeast of Copper Blow trend (Figure 1). In contrast to the North and South zones at Copper Blow, neither of these are associated with magnetic rocks.

Outcrop in both anomalies is sparse, with a thin veneer of soil cover over much of the area. Rock types include amphibolite, aplitic granite, pelitic metasediments, pegmatite and gossanous quartz veins. The gossanous quartz veins and iron oxide-bearing aplite occur in old prospecting pits. These rocks are interpreted to host primary sulphides at depth.

The overall impression in plan is a large circular or annular body of elevated chargeability 1 kilometre in diameter comprising three separate, but spatially related anomalies; Copper Blow North and South Zones (where drilling has taken place) and new anomalies "A" and "B" which are yet to be tested by drilling.

### *Rock Chip Samples*

Surface investigation of anomalies "A" and "B" revealed limited outcrop. Four rock chip samples were collected. Two of these (samples 30614 and 30615) were located in historic prospecting pits which contain gossanous quartz veins.

Both returned anomalous values in a group of elements which are characteristic of Copper Blow mineralisation (copper, cobalt, silver, molybdenum, cerium, phosphorous, yttrium, nickel, uranium and lanthanum; Table 1).

Table 1 Rock Chip Samples Untested IP Anomalies

Sample No	MGA East (m)	MGA North (m)	Cu (ppm)	Au (ppm)	Co (ppm)	Ag (ppm)	La (ppm)	Mo (ppm)	Ce (ppm)	Ni (ppm)	P (ppm)	U (ppm)	Y (ppm)
30614	548310	6444885	<b>373</b>	0.02	<b>31.7</b>	<b>0.48</b>	16.6	<b>4.52</b>	36.3	96.9	<b>670</b>	2.9	3.6

30616	548466	6444918	50.1	0.02	43.4	0.04	32	3.07	56.8	67.9	300	7.8	14.7
30617	548605	6444859	31	0.01	4.5	0.21	36.4	1.98	68.3	17	320	5	11.4

### What does this mean?

The IP survey has mapped a broad, circular zone of high chargeability over an area one kilometre in diameter. This is interpreted to be in response to extensive hydrothermal alteration and sulphide mineralisation at depth.

Limited rock chip sampling over untested anomalies suggests a geochemical signature similar to the iron oxide copper-gold (IOCG) style of mineralisation at Copper Blow. This style of mineralisation can occur in both magnetic and non-magnetic iron oxides (magnetite and hematite).

Mineralisation may be related to igneous intrusions. An iron and magnesium-rich intrusion called gabbro is recorded in historic holes along with quartz veins in granite within the same shear zone, two kilometres northeast of Copper Blow. Gabbro has also been identified in mineralogical studies of samples from Copper Blow core holes. Gabbro is a magmatic igneous rock derived from a deep-seated batholith which may be a source for copper-mineralising fluid.

These anomalous responses in both magnetic and non-magnetic rocks indicate the presence of a large mineralising geological system of the type associated with intrusions at depth (Figure 4). This has the potential to host various styles of copper-gold mineralisation.

### What next?

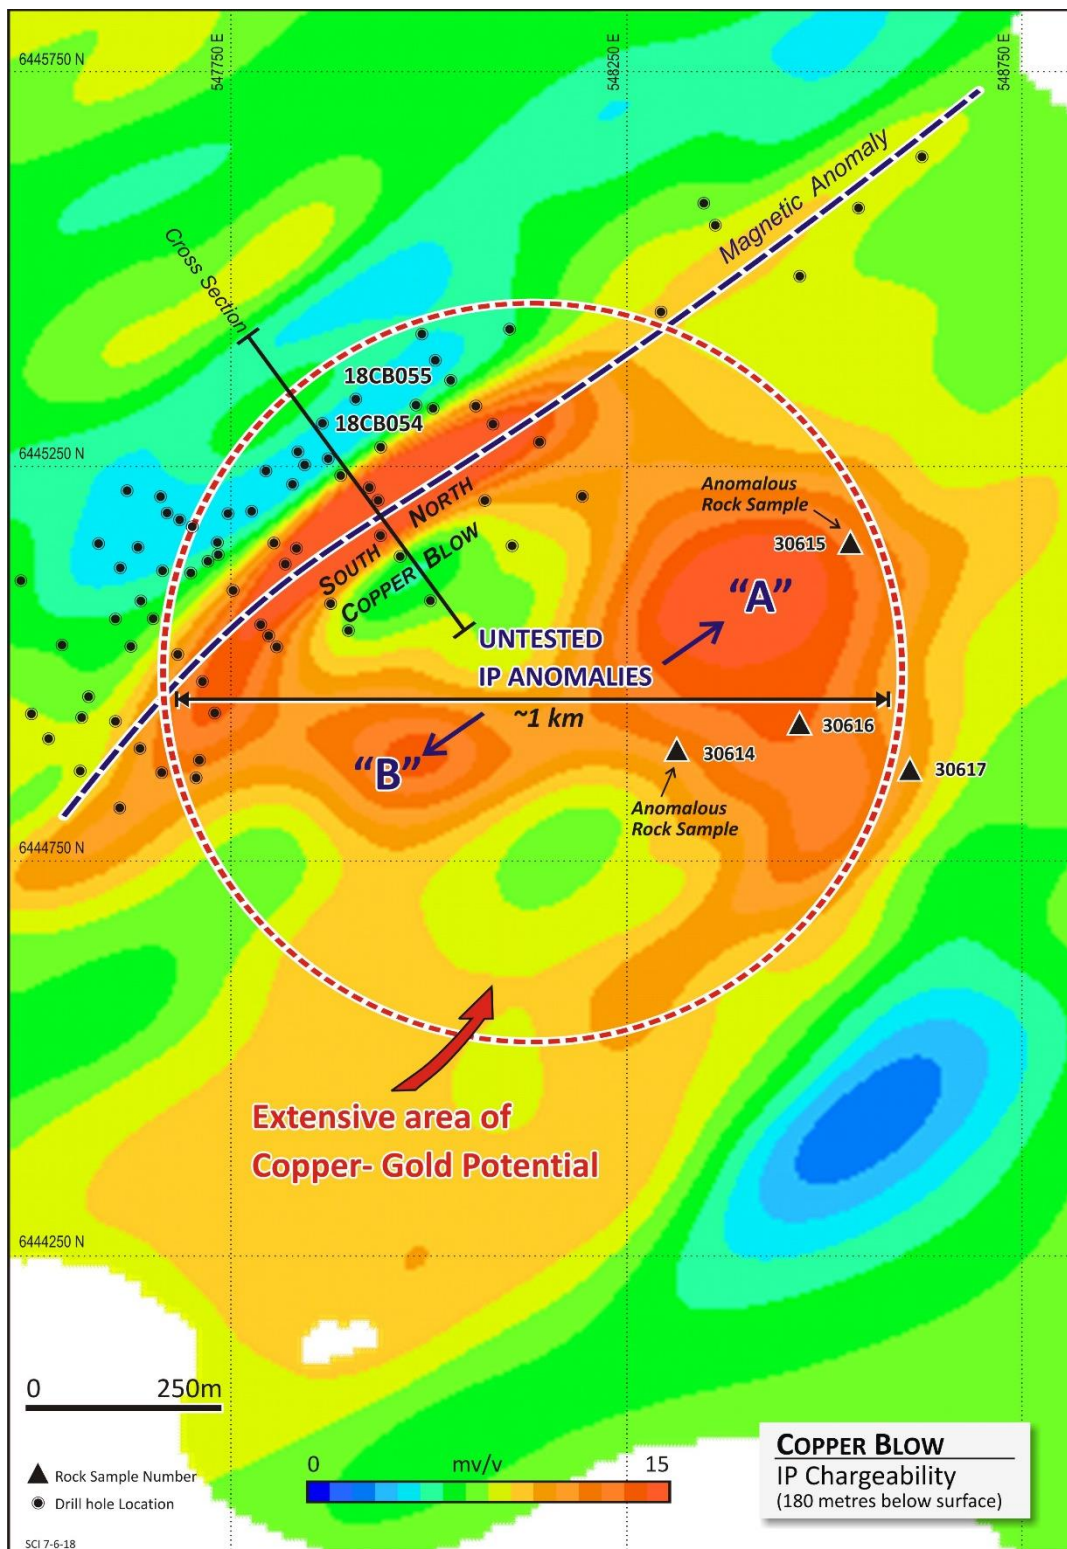

The anomalies outlined by the IP surveys require more detailed follow-up to better define targets for drilling. This work is scheduled to begin later in June. As an initial geochemical assessment, a soil sampling program over anomalies "A" and "B" has been completed and results are pending.

The Company is waiting for results seven drilled holes completed during the recent program. These are likely to be received in late June to early July.

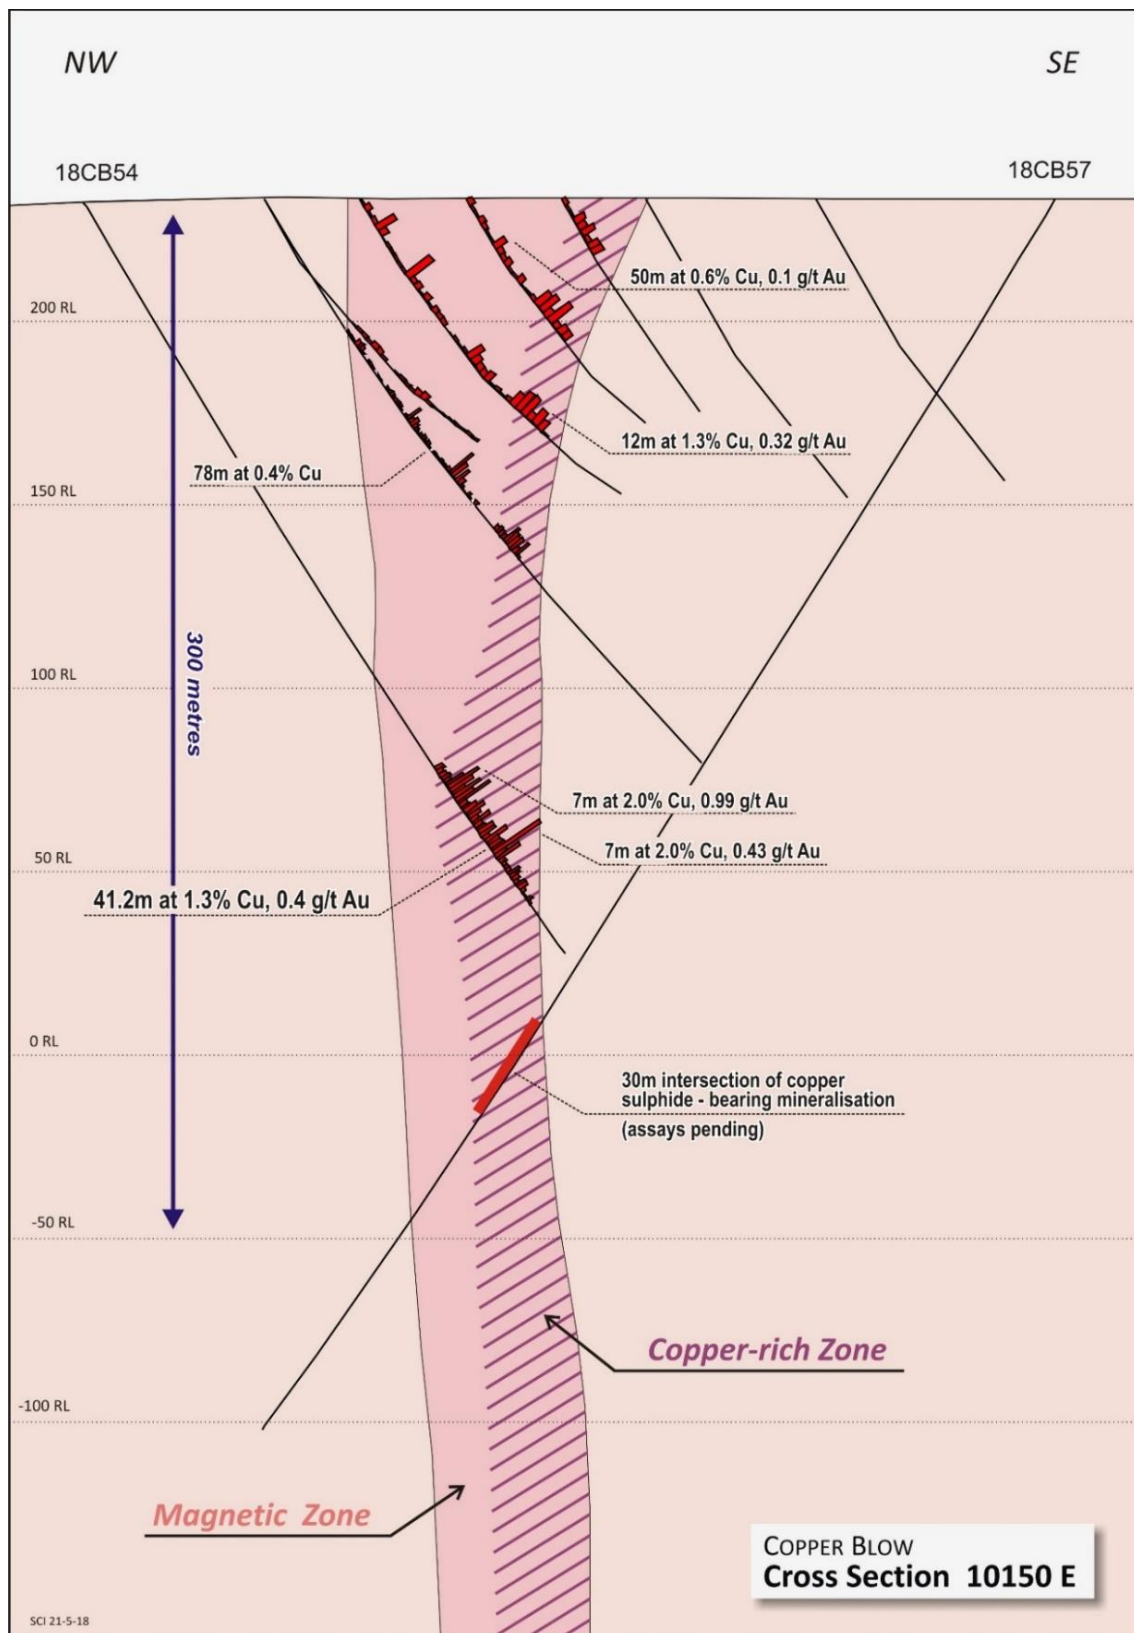

**Plate 1** Example of abundant copper mineralisation in magnetite rich rocks in hole 18CB054. Black is predominantly magnetite, biotite and quartz. Yellow-bronze speckle is sulphide dominated by chalcopyrite (copper sulphide). The IP survey responds well to this style of mineralisation. (see Figures 1-3).

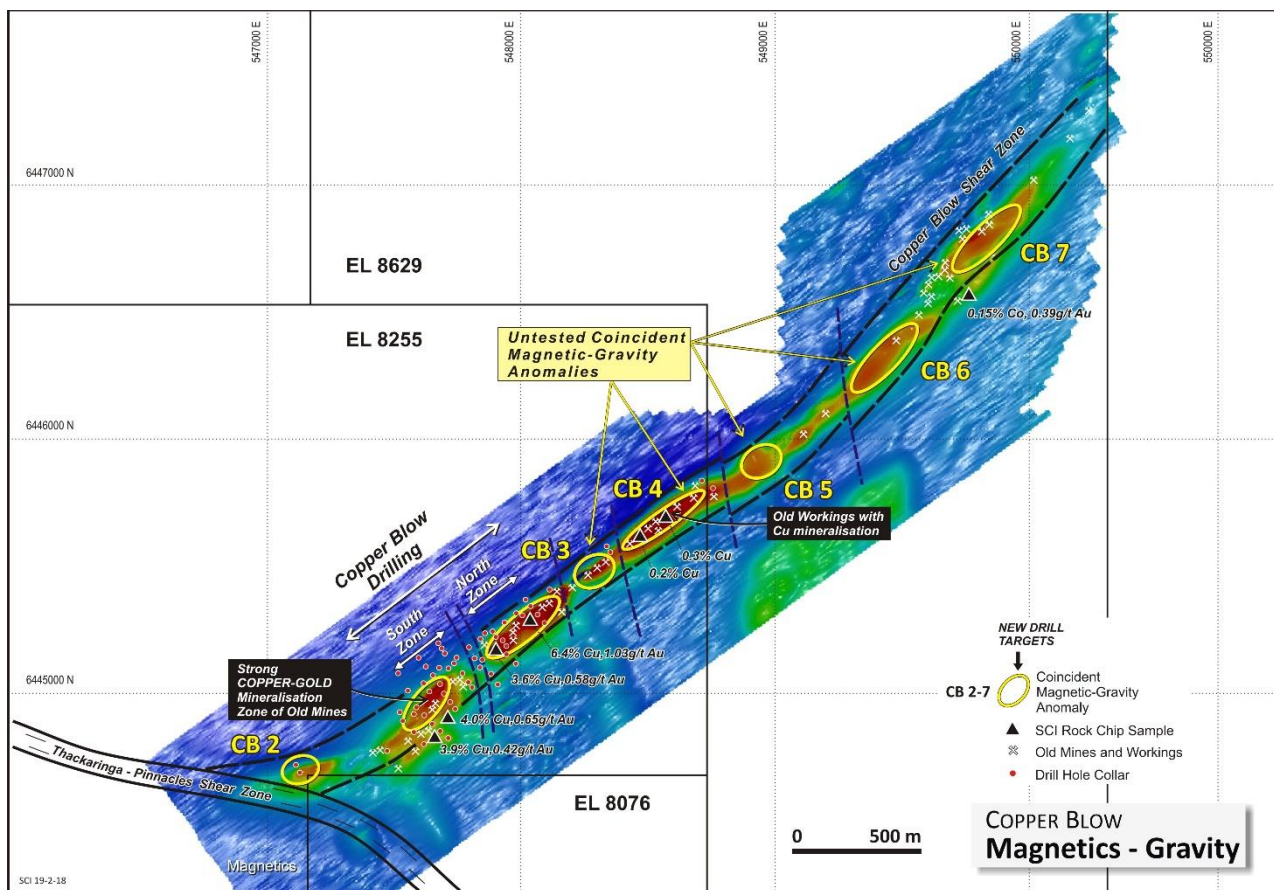

Annexure 1 Figures

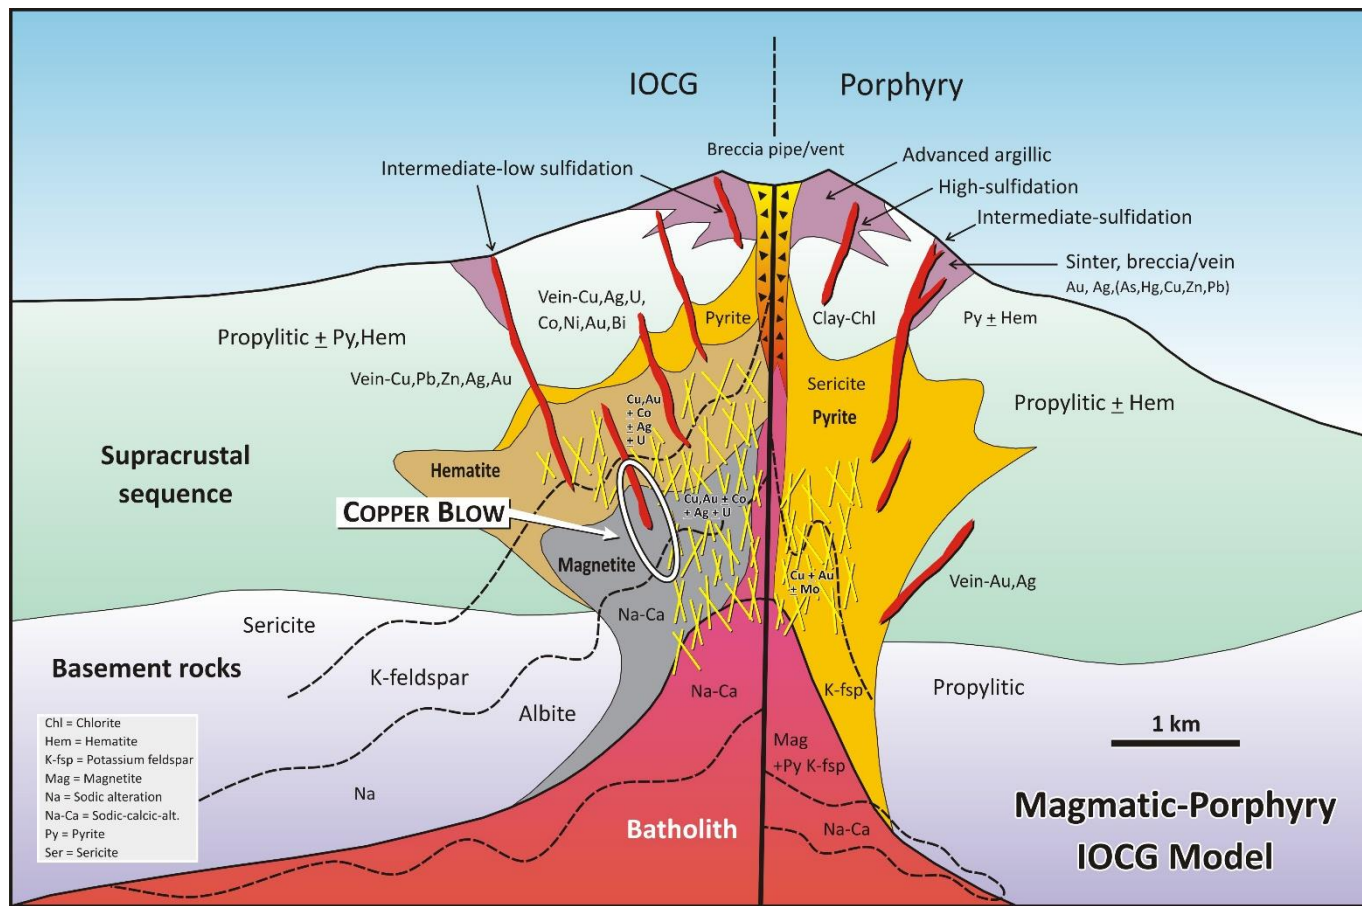

**Figure 1** IP inversion model showing chargeability at approximately 180 metres below surface. Chargeability outlines a large circular feature 1 kilometre in diameter. The copper-gold mineralisation defined by drilling in the North and South Zones at Copper Blow are linked to two large anomalies “A” and “B” which have not been tested by drilling.

**Figure 2** Cross Section 10150 (from Figure 1) showing mineralised intersections in holes 18CB054 and 18CB057.

**Figure 3** Detailed ground magnetic survey reduced to pole image. Shows a series of coincident magnetic/gravity anomalies. In addition to the North and South Zones at Copper Blow there are seven targets all of which might host copper mineralisation.

**Figure 4** A combined magmatic conceptual model which shows features of alteration and mineralisation in an IOCG deposit juxtaposed against a porphyry deposit. Both have a batholithic magmatic source. *Modified from Richards and Mumin Magmatic-hydrothermal processes within an evolving Earth: Iron oxide-copper-gold and porphyry Cu Mo Au deposits. Geology Vol 41(7).*

## SILVER CITY MINERALS LIMITED

**Christopher Torrey**  
Managing Director

### **ABOUT Silver City Minerals Limited**

*Silver City Minerals Limited (SCI) is a base and precious metal explorer with a strong focus on the Broken Hill District of western New South Wales, Australia. It takes its name from the famous Silver City of Broken Hill, home of the world's largest accumulation of silver, lead and zinc; the Broken Hill Deposit. SCI was established in May 2008 and has been exploring the District where it controls Exploration Licences through 100% ownership and various joint venture agreements. It has a portfolio of highly prospective projects with drill-ready targets focused on high grade silver, gold and base-metals, and a pipeline of prospects moving toward the drill assessment stage. The Company continues to seek out quality projects for exploration and development.*

### **Caution Regarding Forward Looking Information.**

*This document contains forward looking statements concerning Silver City Minerals Limited. Forward-looking statements are not statements of historical fact and actual events and results may differ materially from those described in the forward looking statements as a result of a variety of risks, uncertainties and other factors. Forward-looking statements are inherently subject to business, economic, competitive, political and social uncertainties and contingencies. Many factors could cause the Company's actual results to differ materially from those expressed or implied in any forward-looking information provided by the Company, or on behalf of, the Company. Such factors include, among other things, risks relating to additional funding requirements, metal prices, exploration, development and operating risks, competition, production risks, regulatory restrictions, including environmental regulation and liability and potential title disputes. Forward looking statements in this document are based on Silver City's beliefs, opinions and estimates of Silver City Minerals as of the dates the forward looking statements are made, and no obligation is assumed to update forward looking statements if these beliefs, opinions and estimates should change or to reflect other future development.*

### **Competent Persons**

*The information in this report that relates to Exploration Results is based on information compiled by Chris Torrey (BSc, MSc, RPA Geo Mineral Exploration), who is a member of the Australian Institute of Geoscientists. Mr Torrey is the Managing Director, a shareholder and full time employee of Silver City Minerals Limited. Mr Torrey has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as "Competent Persons" as defined by the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Torrey, consents to the inclusion in this Report of the matters based on this information in the form and context in which it appears.*

*This report contains information extracted from the following reports: ASX Releases 22 February 2018, 2 May 2018 and 28 May 2018 and is available to view on the website [www.silvercityminerals.com.au](http://www.silvercityminerals.com.au). The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcement. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcement.*
