

## ASX Announcement

**16 January 2019**

### Santa Cruz Gold Projects Update

#### Highlights:

- Infill sampling at Cachi Prospects confirms gold-silver anomalousm.
- Visible Gold identified at the Morena Prospect.

Dark Horse Resources Limited (ASX: DHR; the Company) continues the surface exploration works across its portfolio of Santa Cruz gold projects (**Figure 1**). These have previously been referred to separately as Los Domos, Cachi and the DHR-PROAR group of tenements. The Company now refers to them collectively as the Santa Cruz gold projects because exploration is now advancing across the portfolio of the Company's tenements in Santa Cruz province.

An additional 200 rock samples were collected by Dark Horse geologists across the Santa Cruz projects in November and December 2018. This brings the total number of reconnaissance samples collected this field season to 584. All samples have been assayed for a diverse suite of elements. The latest work completes reconnaissance sampling of green field targets identified by former workers and recent Landsat-8 imagery, and includes infill sampling at a number of prospects within the Cachi tenement - Vetas Cachi, Morena, Vetas NW, Cachi Centro, Los Bloques and Cachi Norte from south to north, **Figure 2**.

Gold (Au) grades vary from below detection limit to a maximum of 3.8 g/t Au; 8 samples are in excess of 0.2 g/t Au and 4 greater than 0.5 g/t Au. Silver (Ag) grades vary from below detection limit to a maximum of 68ppm Ag; 65 samples are in excess of 5ppm Ag and 16 greater than 20ppm Ag.

These results are statistically comparable to the 384 samples collected earlier in the field season and reported to the ASX on December 14, 2018 which displayed a data range up to 9.72 g/t Au and 226ppm Ag. In that release 19% of the gold samples were anomalous and 16% of the silver samples were anomalous.

Strong anomalousm is also seen in arsenic and antimony. The arsenic (As) distribution contains 13 samples with values greater than 500ppm As and 1 sample in excess of 0.5% As. Antimony (Sb) has 5 samples in excess of 50ppm Sb. The full suite of geochemistry results are included as **Table A**.

Infill sampling at Vetas Cachi has confirmed previous assays and a new prospect has been identified and sampled at El Cruce with anomalous results (**Figure 2**).

Dark Horse Director Jason Beckton visited the Cachi project with the senior Argentine geological team in early January (**refer Photo 1**) and during this trip **visible gold** was observed in several rock specimens. At Morena, iron sulphide/oxide breccia hosting visible gold (**Photo set 2**) occurs in subcrop along the downslope of a prominent ridge formed by silica replacement. This is a characteristic feature of a number of prominent epithermal systems (Cerro Moro, Slovakia, Palmaréjo) where the mineralization occurs in a geomorphologically recessive zone caused by easily erodible sulphides parallel to a silica rich fault that has acted as a fluid barrier.

**Photo 1:** Dark Horse Director Jason Beckton with senior Argentine geologist Nicolas Stoessel at an outcropping epithermal quartz vein within the Cachi Project.

**Photo 2 Visible Gold in Sulphide Breccia; Morena Prospect**

Regional reconnaissance work to date has confirmed the Cachi and Rosita Norte tenements as prospective for epithermal gold-silver mineralization. Other tenements in the Santa Cruz portfolio continue to be explored and evaluated.

Environmental permitting has commenced for the Cachi project to allow further testing by trenching and drilling. Ongoing, definitive results will be reported to the market as they come to hand.

The Company has terminated its agreement with the vendor of the Los Domos gold project in Santa Cruz because the significant amount of surface exploration work carried out by Dark Horse concluded the potential rhyolitic breccia/epithermal target is at a depth not conducive to the Company's current resource objectives.

Dark Horse is aggressively continuing its lithium resources business in Argentina and a separate update will be provided to the market shortly.

On behalf of the Board  
Mr Karl Schlobohm

### Competent Persons Statement

The information herein that relates to Exploration Targets and Exploration Results is based on information compiled by Mr Jason Beckton, who is a member of The Australian Institute of Geoscientists. Mr Jason Beckton is a Director of Dark Horse Resources Ltd.

Mr Beckton has more than five years' experience which is relevant to the style of mineralisation and types of deposits being reported and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves' (the JORC Code). This public report is issued with the prior written consent of the Competent Person(s) as to the form and context in which it appears.

### About Dark Horse Resources

Dark Horse Resources Ltd is an Australian, publicly listed mineral resource company (ASX: DHR), with a particular focus on Argentina, where it has invested in lithium and gold projects, with objectives to:

- Define substantial lithium resources, mine spodumene and brine, and produce high grade lithium products for the domestic and international battery and electronic markets.
- Discover and define several multimillion ounce gold deposits and the production of gold doré.

Dark Horse also has a power generation subsidiary, Dark Horse Energy and a substantial holding (33%) in Australian-based and ASX-listed oil and gas exploration company Lakes Oil NL (ASX:LKO).

Note 1: reconnaissance sampling where Length is not specified  
Note 2: a negative assay is Below Level of Detection

## JORC Code, 2012 Edition – Table 1 –

### RockChip Sampling

#### Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> <li><i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li> <li><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li><i>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></li> </ul>	<ul style="list-style-type: none"> <li>Stratified random chip sample across outcrop trend, collecting 3-4Kg of material</li> </ul>
<i>Drilling techniques</i>	<ul style="list-style-type: none"> <li><i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></li> </ul>	<ul style="list-style-type: none"> <li>Not Applicable</li> </ul>
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> <li><i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></li> <li><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></li> <li><i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></li> </ul>	<ul style="list-style-type: none"> <li>Not Applicable</li> </ul>
<i>Logging</i>	<ul style="list-style-type: none"> <li><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource</i></li> </ul>	<ul style="list-style-type: none"> <li>Field description of outcrop with reference to lithology, alteration,</li> </ul>

Criteria	JORC Code explanation	Commentary
	<p><i>estimation, mining studies and metallurgical studies.</i></p> <ul style="list-style-type: none"> <li>• Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>• The total length and percentage of the relevant intersections logged.</li> </ul>	mineralization and structure
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> <li>• If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>• If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>• For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>• Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>• Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>• Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>• Not Applicable</li> </ul>
<i>Quality of assay data and laboratory tests</i>	<ul style="list-style-type: none"> <li>• The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>• For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>• Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>• Samples are analyzed by Alex Stewart Laboratories</li> <li>• Sample preparation of fine crush, riffle split and ring pulverizing of 1kg to 85% &lt; 75µm.</li> <li>• Pulps are analyzed using method codes Au4-30 &amp; ICP-MA-39; a 30g fire assay with an AA finish and a 39 element determination using an aqua-regia digestion with ICP-AES determination.</li> <li>• OREAS® Standards are inserted in the sample sequence at the rate of 1 in 40.</li> </ul>
<i>Verification of sampling and assaying</i>	<ul style="list-style-type: none"> <li>• The verification of significant intersections by either independent or alternative company personnel.</li> <li>• The use of twinned holes.</li> <li>• Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>• Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>• Laboratory CSV files are merged with location data files using unique sample numbers as the key.</li> <li>• No adjustments made to assay data</li> </ul>

Criteria	JORC Code explanation	Commentary
<i>Location of data points</i>	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>	<ul style="list-style-type: none"> <li>Samples are located using handheld GPS receivers.</li> <li>UTM projection Gaus_Kruger_(CIZ2)</li> </ul>
<i>Data spacing and distribution</i>	<ul style="list-style-type: none"> <li><i>Data spacing for reporting of Exploration Results.</i></li> <li><i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></li> <li><i>Whether sample compositing has been applied.</i></li> </ul>	<ul style="list-style-type: none"> <li>Stage 1 Exploration Sampling only</li> <li>No compositing has been applied.</li> </ul>
<i>Orientation of data in relation to geological structure</i>	<ul style="list-style-type: none"> <li><i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i></li> <li><i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></li> </ul>	<ul style="list-style-type: none"> <li>Samples are collected transverse to the strike of the outcrop.</li> <li>No bias is believed to be introduced by the sampling method.</li> </ul>
<i>Sample security</i>	<ul style="list-style-type: none"> <li><i>The measures taken to ensure sample security.</i></li> </ul>	<ul style="list-style-type: none"> <li>Samples are hand delivered to the laboratory</li> </ul>
<i>Audits or reviews</i>	<ul style="list-style-type: none"> <li><i>The results of any audits or reviews of sampling techniques and data.</i></li> </ul>	<ul style="list-style-type: none"> <li>Internal review of methodology is undertaken regularly by senior company personnel.</li> </ul>

## Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<ul style="list-style-type: none"> <li><i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i></li> <li><i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i></li> </ul>	<ul style="list-style-type: none"> <li>The Santa Cruz Project consists of 176,468Ha under an Earn-In agreement with Proar and 43,789Ha under an Earn-In agreement with Tres Cerros Exploraciones.</li> <li>There are no known impediments to exploration in the current area of operations.</li> </ul>

Criteria	JORC Code explanation	Commentary
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> <li><i>Acknowledgment and appraisal of exploration by other parties.</i></li> </ul>	<ul style="list-style-type: none"> <li><i>Greenfields exploration</i></li> </ul>
<i>Geology</i>	<ul style="list-style-type: none"> <li><i>Deposit type, geological setting and style of mineralisation.</i></li> </ul>	<ul style="list-style-type: none"> <li><i>Exploration for epithermal gold-silver deposits in the prospective Chon Aike Formation which hosts the Cerro Vanguardia, Mine Marta and Josefina Deposits</i></li> </ul>
<i>Drill hole Information</i>	<ul style="list-style-type: none"> <li><i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ul style="list-style-type: none"> <li><i>easting and northing of the drill hole collar</i></li> <li><i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i></li> <li><i>dip and azimuth of the hole</i></li> <li><i>down hole length and interception depth</i></li> <li><i>hole length.</i></li> </ul> </li> <li><i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i></li> </ul>	<ul style="list-style-type: none"> <li><i>Not Applicable</i></li> </ul>
<i>Data aggregation methods</i>	<ul style="list-style-type: none"> <li><i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i></li> <li><i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></li> <li><i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></li> </ul>	<ul style="list-style-type: none"> <li><i>Not Applicable</i></li> </ul>
<i>Relationship between mineralisation</i>	<ul style="list-style-type: none"> <li><i>These relationships are particularly important in the reporting of Exploration Results.</i></li> <li><i>If the geometry of the mineralisation with respect to the drill hole angle is</i></li> </ul>	<ul style="list-style-type: none"> <li><i>Not Applicable</i></li> </ul>

Criteria	JORC Code explanation	Commentary
<i>on widths and intercept lengths</i>	<p><i>known, its nature should be reported.</i></p> <ul style="list-style-type: none"> <li><i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i></li> </ul>	
<i>Diagrams</i>	<ul style="list-style-type: none"> <li><i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i></li> </ul>	<ul style="list-style-type: none"> <li><i>Sample Location map included in discussion</i></li> </ul>
<i>Balanced reporting</i>	<ul style="list-style-type: none"> <li><i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i></li> </ul>	<ul style="list-style-type: none"> <li><i>Full sample listing included.</i></li> </ul>
<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> <li><i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i></li> </ul>	<ul style="list-style-type: none"> <li><i>Not Applicable – stage 1 exploration</i></li> </ul>
<i>Further work</i>	<ul style="list-style-type: none"> <li><i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></li> <li><i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i></li> </ul>	<ul style="list-style-type: none"> <li><i>Follow-up mapping and sampling in progress</i></li> </ul>
