

8 July 2019

Additional high-grade results returned from Flemington resource drill program

HIGHLIGHTS:

- Additional high-grade intersections highlighted from second tranche of results at the Flemington Mineral Resource extension drilling program
- Intersections include¹:
 - 11 metres at 1,001ppm (0.10%) cobalt from surface
 - 10 metres at 1,062ppm (0.10%) cobalt from 1 metre depth
 - 10 metres at 1,014ppm (0.10%) cobalt from 12 metres depth
 - 15 metres at 576ppm scandium from 12 metres depth
 - 12 metres at 500ppm scandium from surface
 - 10 metres at 315ppm scandium from surface
 - 13m @ 10,024ppm (1.00%) Nickel from surface
 - 12m @ 10,019ppm (1.00%) Nickel from 1 metre depth
 - 14m @ 1,205ppm (0.12%) Copper from 12 metre depth
- High-grade horizon shown to extend beyond the existing Flemington Mineral Resource²
- Second high-grade mineralised zone open on both sides
- Final batch of assays anticipated to become available throughout the coming weeks.

¹ See Table 1 and Appendix 1 and Appendix 2 of this report for more information

² The Mineral Resource Estimate for the Flemington Cobalt-Nickel-Scandium Project is reported under JORC 2012 Guidelines and was reported by Australian Mines Limited on 31 October 2017. The Mineral Resource for Flemington, as announced on 31 October 2017 is: Measured 2.5Mt @ 0.103% Co & 403ppm Sc, Indicated 0.2Mt @ 0.076% Co & 408ppm Sc. There has been no Material Change or Re-estimation of the Mineral Resource since this 31 October 2017 announcement by Australian Mines

Advanced battery materials developer, **Australian Mines Limited** (“Australian Mines” or “the Company”) (Australia ASX: AUZ; USA OTCQB: AMSLF; Frankfurt Stock Exchange: MJH) is pleased to announce that further positive assay results have been received from the first phase of the Company’s Mineral Resource expansion drilling campaign³ at its 100%-owned Flemington Project in New South Wales, Australia.

The Flemington Project, located in central New South Wales, is Australian Mines’ second battery materials project after its flagship Sconi Nickel-Cobalt-Scandium Project in North Queensland, where the Company continues to advance project development following the release of a Bankable Feasibility Study in November 2018⁴ and a subsequent optimised study reported in June 2019⁵.

To date, the Company has received 82% of the assay results from the May 2019 drilling program⁶. These initial results have shown a zone of high-grade cobalt and scandium mineralisation extending westward for over 300 metres directly from the current Mineral Resource at Flemington, giving encouragement for expansion of the current Mineral Resource.

A second zone with high grades of cobalt, copper and nickel has been highlighted in the assay results. This second area is centred just over 800 metres west of the existing Mineral Resource and appears to remain open to the west of the current drilling.

Due to limited assay results that are located between these two areas, it is too early to know if mineralisation in these areas is continuous; however, initial signs from the drilling observations are encouraging. Further results from this area are due in the coming weeks.

Given the highly encouraging early results (as summarised in this report), a large-scale follow-up infill and expansion drilling campaign is currently being planned for later in the calendar year to enable the Company to better determine the full extent of the mineralised envelope at Flemington and, in turn, maximise the Mineral Resource⁷ potential for the Project.

³ Australian Mines, AUZ secures funds to accelerate cobalt and nickel projects, released 27 February 2019

⁴ Australian Mines, BFS supports strong commercial case for developing Sconi, released 20 November 2018

⁵ Australian Mines, Sconi to generate \$5 billion in free cashflow, released 13 June 2019

⁶ see Table 1 and Appendix 1 and 2 for full details of the assays received as at this time of this report

⁷ The Mineral Resource Estimate for the Flemington Cobalt-Nickel-Scandium Project is reported under JORC 2012 Guidelines and was reported by Australian Mines Limited on 31 October 2017. The Mineral Resource for Flemington, as announced on 31 October 2017 is: Measured 2.5Mt @ 0.103% Co & 403ppm Sc, Indicated 0.2Mt @ 0.076% Co & 408ppm Sc. There has been no Material Change or Re-estimation of the Mineral Resource since this 31 October 2017 announcement by Australian Mines

Table 1: Highlighted intersections returned from the second round of assays from the Australian Mines' resource expansion drilling campaign⁸ at its 100%-owned Flemington Project in New South Wales, Australia. Full details, including the drill hole location information and the assays returned over each individual metre are documented in Appendix 1 and Appendix 2 of this report respectively. Further assays results are anticipated to become available throughout the next few weeks.

⁸ Australian Mines, AUZ secures funds to accelerate cobalt and nickel projects, released 27 February 2019

FLEMINGTON REGIONAL TENEMENT MAP

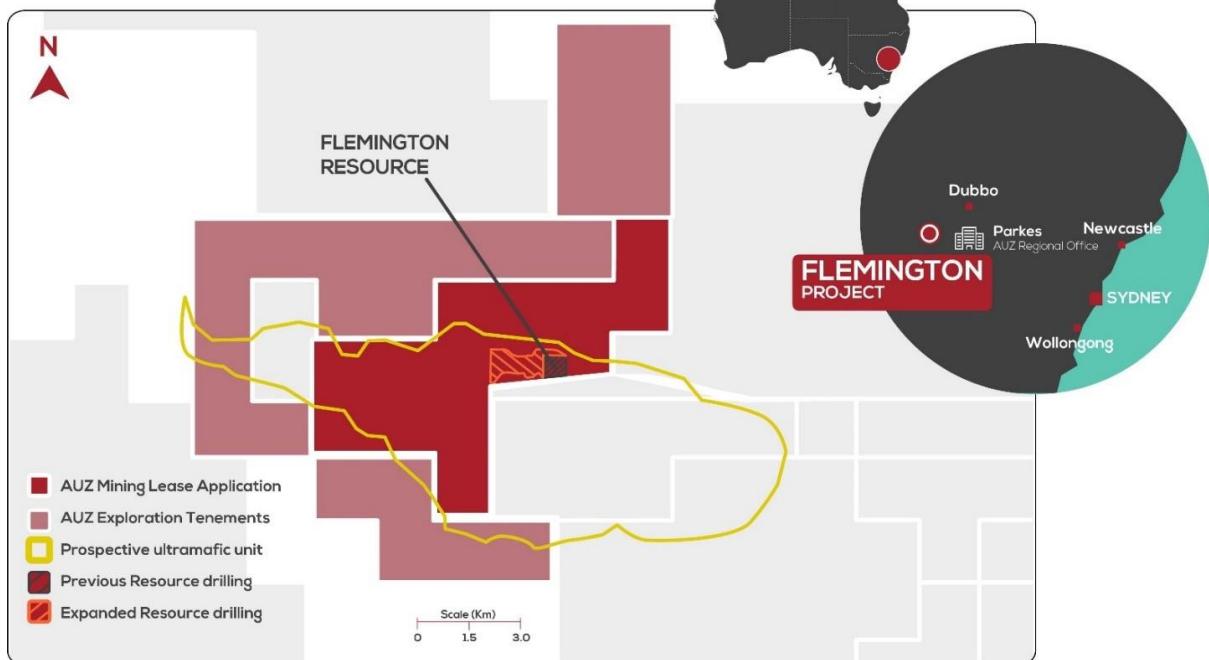

Figure 1: Located in central New South Wales, the Flemington Project covers a significant portion of the prospective Tout Complex (as outlined in yellow in this figure), being the geological unit that hosts both Australian Mines' Flemington cobalt-scandium-nickel deposit⁹ and Clean TeQ's adjoining Sunrise deposit¹⁰.

⁹ Australian Mines acquired a 100% interest in the Flemington Project in the September quarter of 2018. The Mineral Resource Estimate for the Flemington Cobalt-Nickel-Scandium Project is reported under JORC 2012 Guidelines and was reported by Australian Mines Limited on 31 October 2017. The Mineral Resource for Flemington, as announced on 31 October 2017 is: Measured 2.5Mt @ 0.103% Co & 403ppm Sc, Indicated 0.2Mt @ 0.076% Co & 408ppm Sc. There has been no Material Change or Re-estimation of the Mineral Resource since this 31 October 2017 announcement by Australian Mines.

There is significant potential to expand the Mineral Resource given only about 1% of the interpreted prospective geology at Flemington has been comprehensively tested to date.

¹⁰ Australian Mines' Flemington Project has been established to be the direct continuation of Clean TeQ Holding's Sunrise orebody, with the deposit separated arbitrarily by the tenement boundary. (See Australian Mines, Resource confirms Flemington's cobalt credentials, released 31 October 2017)

Flemington Updated Drilling Map

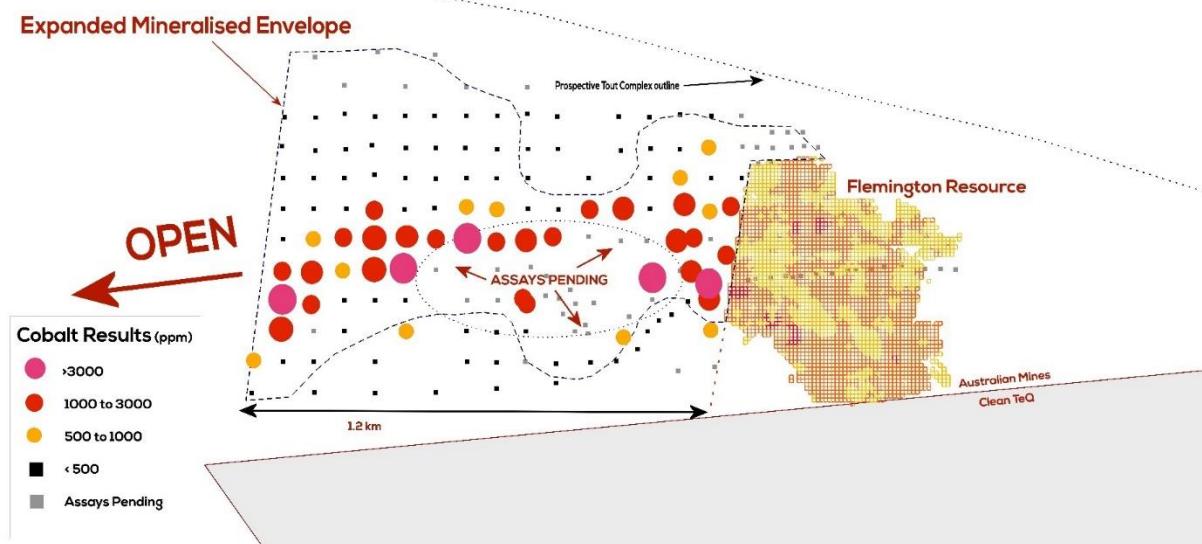

Figure 2: Flemington location map showing the expanded mineralised boundary¹¹ targeted by Australian Mines' recent air core drilling program with available assay results locations highlighted. Assays for the remaining drill holes are not currently available. Full details of this drilling program are documented in Appendix 1 and Appendix 2 of this report respectively. Further assays results are anticipated to become available throughout July 2019.

¹¹ The drilling program was focused on confirming Australian Mines' geological modelling in known areas of prospective geology and expanding the known boundaries of the mineralised envelope outwards from the existing Flemington resource. During the drilling program a large zone of prospective geology with thicknesses ranging from a few metres to tens-of-metres was encountered. Based on observations made by the Company's geological team during the 2017 drilling campaigns, and cross referenced with the resulting 2017 assays, the mineralised zones within the Flemington project have a distinct appearance which enables the Company's geologists to map potential *mineralised envelopes* via visual identification. It is on that basis that the *expanded mineralised envelope* is drafted in Figure 2 of this report. Australian Mines cautions that this reference to an *expanded mineralised envelope* as drafted in Figure 2 is done on a qualitative basis and, thus, is subjective only.

Figure 3: Photo taken of aircore drilling rig in operation during Australian Mines' May 2019 Mineral Resource expansion drill program at its Flemington Project in central New South Wales.

Appendix 2

Flemington Aircore Drill Program – Assay Table

Assays from the second tranche May 2019 resource expansion drill program as received by the Company at the time of this report. It should be noted that principal elements of interest are reported in the table. Assays of other elements are omitted from Appendix 2 as they are not material to the overall outcome of results.

Appendix 3

JORC Code, 2012 Edition

Section 1: Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> • <i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</i> • <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> • <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> • <i>In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems.</i> • <i>Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i> 	<p>Vertical air core holes were drilled and sampled over successive one metre intervals via an on-board cyclone.</p> <p>All of samples were collected on 1 metre intervals.</p> <p>A 1/6 split (approximately 2 kilograms) was collected from a cyclone-mounted rotary splitter for assaying, with the remainder of the material from each interval retained for reference.</p> <p>Sampling is guided by Australian Mines' protocols and QA/QC procedures, which were designed in consultation with CSA Global, Perth.</p> <p>The samples were sent to SGS (Perth) for sample preparation and assaying. Sample preparation included drying, crushing, splitting, and then pulverising a 250 grams aliquot to a nominal size of 85% passing 75 µm for assaying.</p> 

<i>Drilling techniques</i>	<ul style="list-style-type: none"> <i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</i> 	The holes relevant to this report were drilled by air core technique using a truck-mounted rig fitted with a 95 mm open-bladed bit, and an inner tube diameter of 57 mm.
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/ coarse material.</i> 	<p>Sample recovery from this air core program was high with more than 90% of the sample returned from most metres.</p> <p>The cyclone-mounted rotary splitter was cleaned on a regular basis to eliminate down-hole and cross-hole contamination.</p> <p>The majority of the samples are described as being relatively dry, with limited moist or wet samples.</p> <p>There is no observable relationship between recovery and grade, and therefore no sample bias is assumed.</p> <p>Australian Mines protocols designed in consultation with CSA Global (Perth) are followed to preclude any issues of sample bias due to material loss or gain.</p>
<i>Logging</i>	<ul style="list-style-type: none"> <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</i> <i>The total length and percentage of the relevant intersections logged.</i> 	<p>The chip samples were logged during drilling by the site geologist</p> <p>Geological logging of drill chips included the recording of lithology, mineralogy, texture, weathering, oxidation, colour and other features of the samples, with the data considered by the Company's Competent Person sufficient to support a future Mineral Resource Estimation.</p> <p>100% of the samples/holes were logged by the geologists.</p> <p>Air core logging is deemed to be qualitative.</p>
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> <i>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</i> <i>For all sample types, the nature, quality and appropriateness of the</i> 	<p>The air core samples were collected from each 1 metre interval from the rig-mounted rotary splitter configured to give a 1/6 split.</p> <p>The splits were sent for laboratory preparation and assaying, with the remainder bagged and transported to a sample farm.</p>

	<p><i>sample preparation technique.</i></p> <ul style="list-style-type: none"> • <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> • <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i> • <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> 	<p>Upon receipt by the laboratory, the samples were sorted and oven dried before being crushed.</p> <p>Splits of approximately 250 grams were pulverised to nominal size of 85% passing 75 µm.</p> <p>Sampling nomograms have not been prepared to assess the adequacy of the sample weight and grind size combinations; however, the quality assurance results do not indicate significant issues.</p> <p>Field duplicates, Certified standards, and Blanks were inserted into the sample batches by the site geologist at frequencies of approximately 1:25.</p>
<i>Quality of assay data and laboratory tests</i>	<ul style="list-style-type: none"> • <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> • <i>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> • <i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i> 	<p>All assay values were determined by the ICP 4 acid digest method with a MS finish. Samples with results designated by this technique as too high to be accurately determined by MS, were re-analysed by AES.</p> <p>No geophysical tools or instruments were used during this drill program</p> <p>See above regarding performance of duplicates and blanks.</p> <p>One industry-supplied Certified Reference Material (CRM or "standard") was inserted every 25th sample submitted to the assay laboratory.</p> <p>Similarly, a duplicate sample was taken every 30th sample submitted to the lab for analysis, resulting in nine check samples per hundred samples submitted to the lab from this resource extension drill program, which is consistent with the protocols established by Australian Mines in close consultation with CSA Global in Perth.</p> <p>In addition to Australian Mines check samples, the lab also routinely includes their own CRM during each assay run.</p>
<i>Verification of sampling and assaying</i>	<ul style="list-style-type: none"> • <i>The verification of significant intersections by either independent or alternative company personnel.</i> • <i>The use of twinned holes.</i> • <i>Documentation of primary data, data entry procedures, data verification, data storage</i> 	<p>Each intersection has been separately verified by the technical staff at Australian Mines, including the Competent Person.</p> <p>Primary data was entered in Excel files by the site geologist, and stored on a secure server, and later checked by Australian Mines' Exploration Manager</p>

	<p>(physical and electronic) protocols.</p> <ul style="list-style-type: none"> • Discuss any adjustment to assay data. 	<p>Validation included numerical range checks on survey and interval data, library code lists, and visual checks along with validation in Micromine® mining software. All assay data were accepted into the database as supplied by the laboratory, with no adjustments applied.</p>
<i>Location of data points</i>	<ul style="list-style-type: none"> ▪ Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. ▪ Specification of the grid system used. ▪ Quality and adequacy of topographic control. 	<p>The drill hole collars were surveyed using a hand-held GPS unit (Trimble Geoexplorer 6000). The surveying was conducted by the site geologist, to a reported accuracy of ±1 m (horizontal) and ±10 m (vertical). All survey data are reported according to MGA94 Zone 55, with elevations based on AHD. Due to the flat lying terrain RL data is to be assumed accurate with a hand-held GPS unit for all non-resource field work.</p>
<i>Data spacing and distribution</i>	<ul style="list-style-type: none"> • Data spacing for reporting of Exploration Results. • Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied. 	<p>The drilling was performed on section lines to the MGA94 grid. Australian Mines drill holes extended the Company's existing drill coverage to the north and were drilled on a nominal spacing of 80 x 80 metres. The drill samples were not composited prior to assaying.</p>
<i>Orientation of data in relation to geological structure</i>	<ul style="list-style-type: none"> • Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<p>All drill holes are assumed vertical, which means that most of the sampling is orthogonal to the sub-horizontal zones of elevated grades. No orientation-based sampling biases have been identified, nor are expected for this style of mineralisation.</p>
<i>Sample security</i>	<ul style="list-style-type: none"> • The measures taken to ensure sample security. 	<p>Australian Mines retained responsibility for the samples until they were received by the laboratory. Individual samples for laboratory testing were collected from the rig into labelled calico bags, which were then packed into labelled and sealed polyweave bags.</p>

		<p>The bags were collected from the drill rig at the end of each daily shift and stored in a locked shed located at the exploration team's accommodation facilities in Tullamore (15 kilometres to the north of the site).</p> <p>The samples were then transported by road to the laboratory in West Wyalong by a local contractor.</p> <p>Upon receipt, the samples were checked against the submission sheets and entered into the laboratory's information management system.</p> <p>Assay results were provided electronically to Expedio in both CSV and locked PDF format.</p>
<i>Audits or reviews</i>	<ul style="list-style-type: none"> • <i>The results of any audits or reviews of sampling techniques and data.</i> 	An independent review / audit of the data collection procedures will be conducted as part of any follow-up Mineral Resource Estimate work for the Flemington Project.

Section 2: Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<ul style="list-style-type: none"> <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> 	<p>The Flemington Project, located within 400 kilometres of Sydney (New South Wales, Australia), comprises Exploration Licence numbers (EL) 7805 and 8478, and Mining Lease Application (MLA) 538.</p> <p>An application to renew the full area of EL 7805 was lodged with the NSW Department of Planning and Environment by Australian Mines and is currently pending.</p> <p>EL 7805 will continue to have effect until the application for renewal is determined by the Department.</p> <p>The Department has issued a notice of proposed decision to renew EL 7805 and the Company is currently finalising the documentation with the Department.</p> <p>There are no historical sites, wilderness, national park or environmental settings apparent which may affect either the security of the Flemington Project tenure or provide any impediment to mining operations.</p>
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> <i>Acknowledgment and appraisal of exploration by other parties.</i> 	<p>Australian Mines is not in possession of any third party or historic datasets that may be directly relevant to the results described in the report.</p>
<i>Geology</i>	<ul style="list-style-type: none"> <i>Deposit type, geological setting and style of mineralisation.</i> 	<p>Cobalt, scandium, nickel, platinum and chromium occurs in a thick laterite sequence developed over the Ordovician-aged Tout ultramafic intrusive complex.</p> <p>The laterite sequence includes (from top to bottom) transported (alluvial and colluvial), haematitic, limonitic, transitional and saprolitic lithotypes.</p> <p>The higher cobalt, scandium, nickel and platinum grades dominantly occur in the limonitic laterite and appear to have been derived from the long-term weathering of underlying Ordovician dunite and pyroxenite.</p> <p>In addition to hosting Australian Mines' Flemington ore body, the Tout ultramafic intrusive complex also hosts Clean TeQ Holdings' adjacent Sunrise deposit.</p>

<p><i>Drill hole Information</i></p>	<ul style="list-style-type: none"> • A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> ○ easting and northing of the drill hole collar ○ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar ○ dip and azimuth of the hole ○ down hole length and interception depth ○ hole length. • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<p>Refer to Appendix 1 of this report.</p>
<p><i>Data aggregation methods</i></p>	<ul style="list-style-type: none"> • In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated. No exploration results are reported for this study. Relationship between mineralisation widths and intercept lengths 	<p>The reported intersections of Australian Mines' resource extension drilling at Flemington are based on a regular sample interval of one metre.</p> <p>The quoted intersections are based on a minimum cobalt threshold of 500ppm, and a minimum scandium threshold of 100ppm.</p> <p>Whilst a lower cut-off grade of 100ppm scandium was used for the scandium, a Scoping Study of the Flemington project completed by SRK Consulting and released by Australian Mines via its 31 March 2017 announcement titled <i>Technical Reports</i> suggest that a breakeven grade for any future mining operation at Flemington would be less than 50 ppm scandium.</p> <p>No upper cuts have been applied. An internal dilution of 1 metre has been used for the intersection calculations.</p> <p>No metal equivalents have been used in this report.</p>

	<ul style="list-style-type: none"> • These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known'). 	
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> • These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known'). 	All holes were drilled vertically, and as the laterite sequence is close to flat-lying, the intersected widths of cobalt and scandium mineralisation approximate true widths.
Diagrams	<ul style="list-style-type: none"> • Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	Appropriate maps and sections are included in the body of this report.
Balanced reporting	<ul style="list-style-type: none"> • Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practised to avoid misleading reporting of Exploration Results. 	The reported results reflect a full range of intersected widths and grades available to Australian Mines as at the time of this report.

<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> • <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> 	<p>Australian Mines is not aware of any meaningful and material exploration datasets that are additional to those reported by the Company via the ASX Platform on 11 August 2017 and 31 October 2017.</p>
<i>Further work</i>	<ul style="list-style-type: none"> • <i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> • <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	<p>Further work will likely include further resource extension drilling across the interpreted western, northern and possible eastern continuation of the mineralised zones.</p> <p>The specifications of any future drill program, including the location and targeted depth of these holes, will be announced by Australian Mines prior to the commencement of drilling.</p>

Appendix 4: Competent Persons' Statement

Flemington Project

Information in this report that relates to Flemington Project's Exploration Results is based on information compiled by Mr Mick Elias, who is a Fellow of the Australasian Institute of Mining and Metallurgy. Mr Elias is a director of Australian Mines Limited. Mr Elias has sufficient experience relevant to this style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Elias consents to the inclusion in this report of the matters based on his information in the form and context in which it appears.
