Mallina, WA

Coziron results highlight Mallina potential

DGO Gold (ASX code: DGO) is pleased to note the significant gold intersections in a maiden drill program undertaken by Coziron Limited.

On 6 February 2020, Coziron announced the intersection of gold mineralisation at its Top Camp prospect, 14km south of DGO's Mallina land, including:

8m @ 10.3g/t from 135m

Gold occurrences in this region are commonly associated with anticlinal axes, particularly where they intersect major structures (e.g. De Grey Mining's Mallina Gold Deposit). DGO's Mallina tenements adjoin both Coziron's Croydon Project and De Grey Mining's Mallina Gold Project, and the same anticlinal structures are interpreted to cross all three tenement packages.

DGO holds over 30km's of strike length of a major ENE-trending structure that parallels the Mallina Shear Zone (MSZ). The intersection of anticlines with this structure is associated with a 20km long gold anomaly that defines the Scotties Well target.

DGO is preparing to commence a drilling program over this target in March 2020.

DGO Executive Chairman, Eduard Eshuys said: *“Detailed research into the best locations to discover structurally controlled, sediment hosted gold led to DGO applying for the Mallina tenements. The results from Coziron and the ongoing results from De Grey highlight the potential of this underexplored region.”*

A handwritten signature in black ink, appearing to read 'Eshuys', with a stylized flourish at the end.
