

ASX Announcement (ASX: TSC)

10 March 2020

## AEM survey identifies 13 conductors at Rover

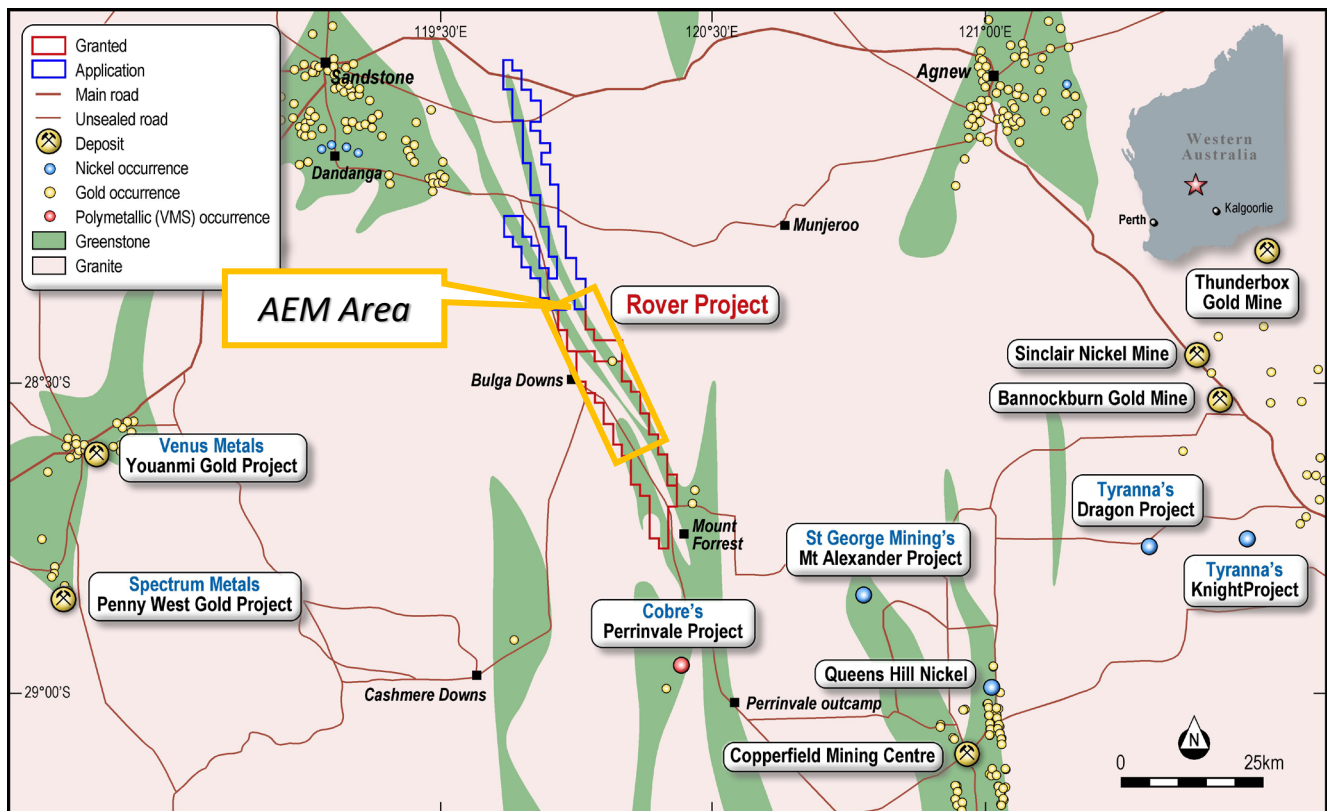

---

- Encouraging AEM survey results, with 13 conductors identified along the 20km prospective gold strike<sup>2</sup> (part of the Maynard Hills greenstone belt) which emphasizes and enhances the prospectivity of the Rover Project
- Two conductors were identified at Creasy 2 where RC drilling recently confirmed strong potential for VMS style mineralisation at depth and/or along strike – an intercept included a thick zone of highly anomalous zinc comprising:
  - 24m @ 1,825ppm Zn from surface
  - grades up to 3,020ppm Zn in a 3m composite sample, and
  - 6m @ 2,210ppm from 33m (19RVRC016)<sup>1</sup>
- Grouping the remaining four conductive responses, highlights the following:
  - Five conductors from 60m deep over a 600m strike extent are coincident with a VMS target identified in a previous study<sup>3</sup> at the newly named Red Bush prospect (south along strike from Creasy 3)
  - One conductor, west of Creasy 1, is located along a strong untested parallel magnetic anomaly
  - Three conductors identified at the southern part of Creasy 3 are coincident with a copper-gold soil anomaly already verified by TSC's geology team
  - Two conductors are located over a gold target previously identified by a geophysics study commissioned by TSC in late 2019<sup>3</sup>
- TSC's geology team is now in the field preparing to commence follow-up RC drilling to expand the shallow high-grade gold discovery and VMS potential at the Creasy 1 and Harmonic prospects, respectively<sup>4</sup>

\*\*\*

CEO Ian Warland commented: *"Without question, identifying 13 conductors along the Maynard Hills greenstone belt from the AEM survey exceeded expectations. This is an exciting development for TSC and delivers a significant pipeline of highly prospective gold & VMS targets. As the geology team is at site for the start of the upcoming RC drilling campaign, we have taken the opportunity to reconcile the AEM results with field observations to formulate which targets are to be prioritised for drill testing. We look forward to reporting further developments as they materialise."*

**TSC Limited (ASX: TSC) (“TSC” or “the Company”)** is delighted to announce the recently completed airborne electromagnetic (AEM) survey identified 13 conductors along the 20km long prospective gold strike, which is part of the Maynard Hills greenstone belt<sup>3</sup> (Figure 1).

**Figure 1: Rover Project relative to greenstone belt & select peers' operations**

## HIGHLY ENCOURAGING AEM SURVEY RESULTS

Data from the AEM survey, facilitated by New Resolution Geophysics' advanced Xcite system, has been analysed by TSC's consultant geophysicist, with the preliminary interpretation identifying **13 conductors along a 15 km stretch of the Maynard Hills greenstone belt** (Figure 2).

The conductors have been grouped into five areas sequentially from north to south, including:

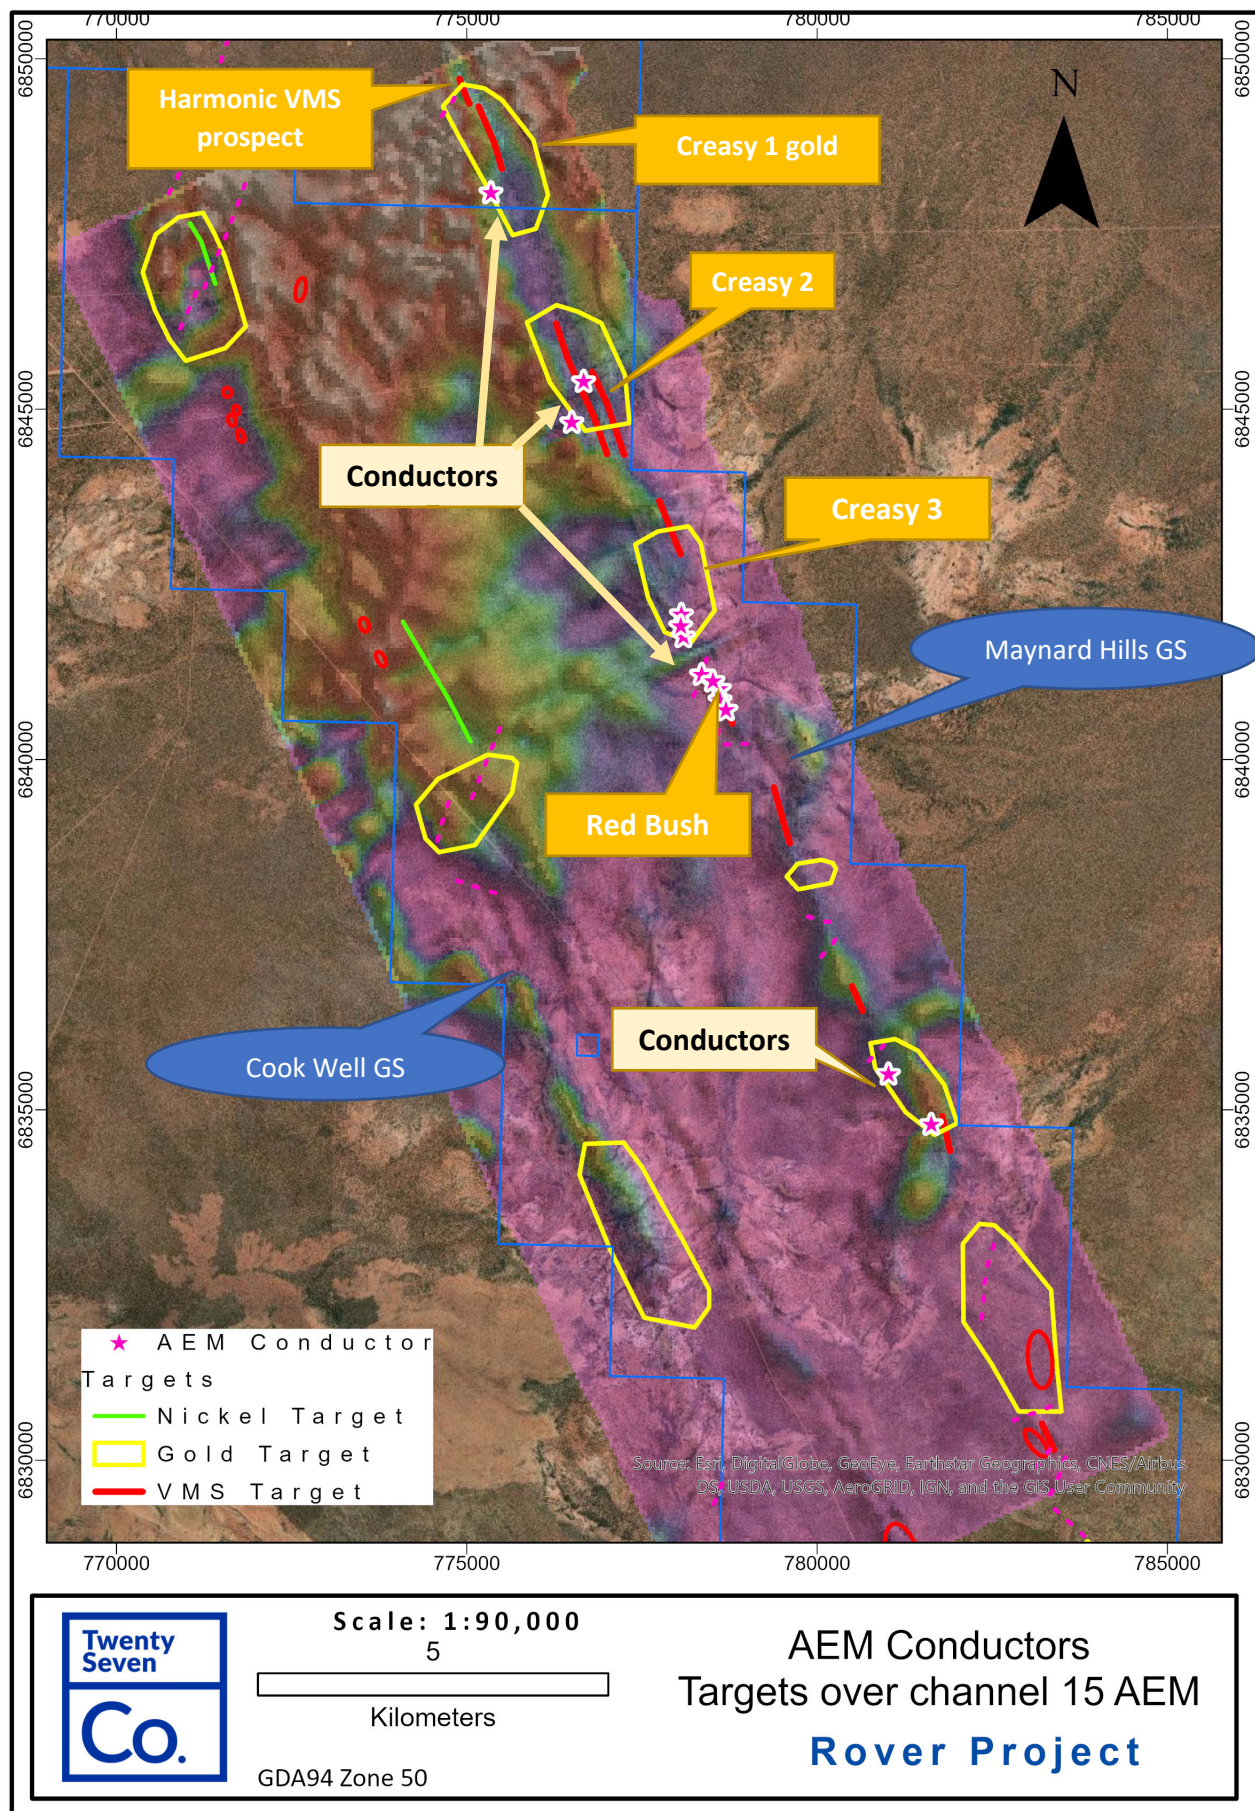

- **Two conductors at Creasy 2 VMS prospect**
- **Five conductors covering a 600m strike at newly discovered Red Bush prospect**
- **One conductor ~300m west of Creasy 1 gold prospect**
- **Three conductors at the southern end of Creasy 3 prospect, and**
- **Two conductors coincident with a gold target identified in a geophysics study last year<sup>3</sup>**

### Red Bush conductors

Overall, the results are highly encouraging, with the best conductive response at **Red Bush**, where responses on five adjacent lines define a conductor with a strike extent of 600m (Figure 3). Notably, modelling the **Red Bush** conductor from the centre shows it commences from a depth of 60m, extending to 160m, and dips WSW parallel with bedding in the area.

These conductors coincide with sub-cropping BIF and mafic schist, with a strong arsenic anomaly (4,040ppm As; 13ppb Au) returned from a rock chip sample (RVR057) collected in 2019. The area has had limited mapping and sampling in the past but will be subject to closer ground inspection moving forward.

**Figure 2: AEM results over channel 15 and TSC targets**

## Creasy 2 conductors

Two conductors were identified at Creasy 2, with one around 220m south-east along strike from drill-hole 19RVRC016, which intersected a thick zone of anomalous zinc from surface including **24m @ 1,825ppm Zn, grades up to 3,020ppm Zn in a 3m composite sample & 6m @ 2,210ppm from 33m (19RVRC016)<sup>1</sup>**. The conductor coincides with BIF and mafic schist that has a strong copper-gold anomaly in the soils. More significantly, circa 400m along strike to the south-east, a rock-chip sample collected in 2019 (RVR041) returned anomalous base metals and arsenic with 1,560ppm Zn in a BIF<sup>2</sup>.

The second conductor is under shallow sand cover and coincident with a linear magnetic anomaly interpreted as mafic rock or BIF.

## Creasy 3 conductors

Three conductors were identified at the southern end of Creasy 3, which is a copper-gold in-soil anomaly. The nearest rock-chip (RVR063), around 270m north of the conductors, returned anomalous gold at 108ppb Au in BIF.

## Creasy 1 conductor

A conductor was found in an area under shallow sand cover circa 300m west of Creasy 1, where the shallow gold discovery was made. As the conductor coincides with a magnetic high, interpreted as a BIF, it will be drilled in the upcoming 2020 RC drilling campaign.

**Plate 1: NRG Xcite system at Rover February 2020**

## Invaluable exploration technology

AEM surveys are an excellent exploration targeting tool and are particularly useful in the detection of VMS and nickel sulphide mineralisation.

The AEM data is gathered by transmitting an EM signal from the system attached to the helicopter, which induces eddy currents in the ground. The system's receiver coils can detect variations in the conductivity of the ground commonly caused by conductive materials such as massive sulphide, saline water and graphite. In TSC's program, a 590 line kilometre regional AEM survey was conducted at 300m line spacing with selected infill lines to 150m in areas of interest.

Across the region, AEM surveys have been successfully utilised by other groups to identify massive sulphide conductors<sup>5</sup>.

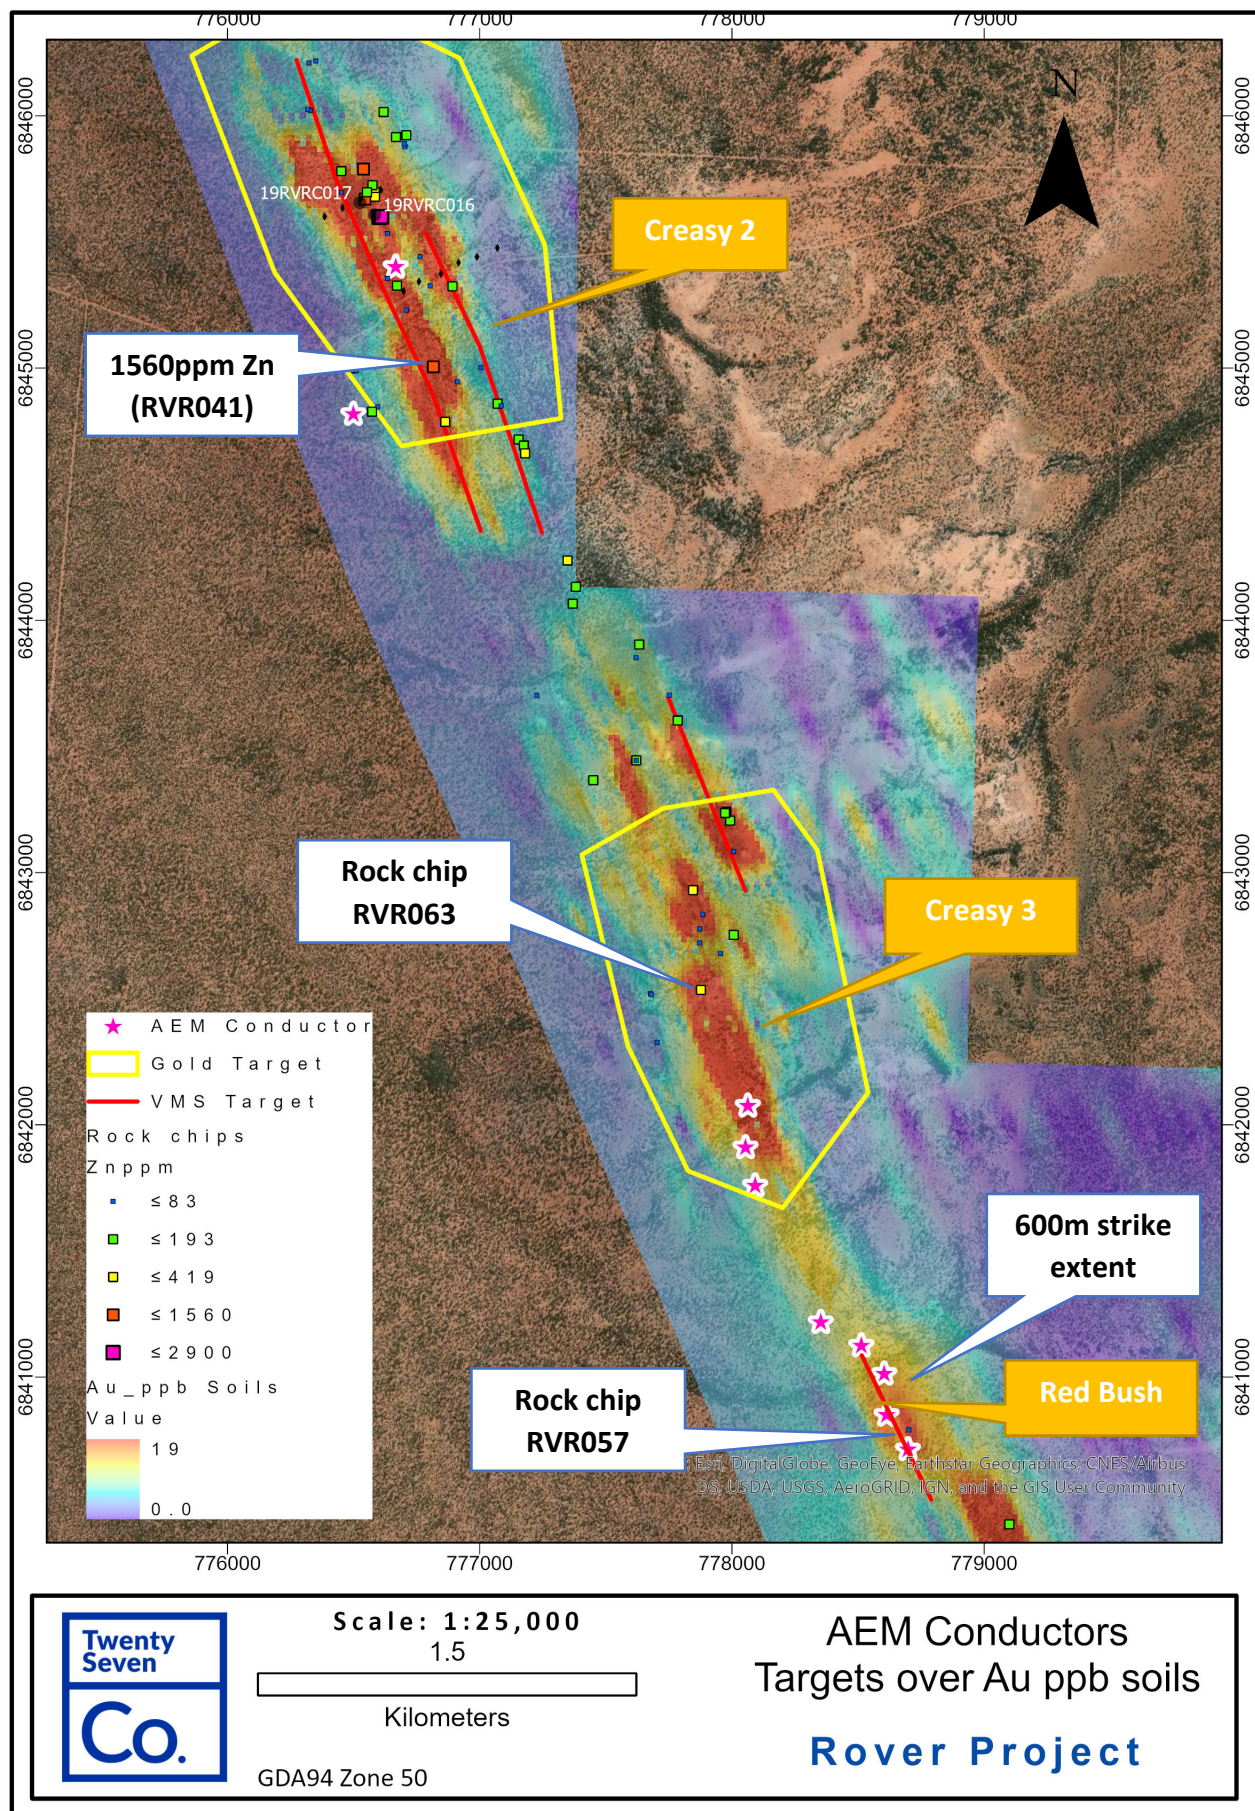

Figure 3: AEM results over Au in soils and TSC targets

## Ongoing Exploration and Next Steps

- RC drilling at Creasy 1 and Harmonic VMS is set to commence imminently.
- AEM targets, which are undergoing follow-up mapping and sampling, will be assessed for ground electromagnetic survey prior to drill testing.

The Board of Twenty Seven Co. Limited authorised this announcement to be given to the ASX.

## COMPETENT PERSON'S STATEMENT:

*The information in this report that relates to Geological Interpretation and Exploration Results is based on information compiled by Ian Warland, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy. Mr Warland is employed Twenty Seven Co. Limited. Mr Warland has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Warland consents to the inclusion in the report of the matters based on his information and the form and context in which it appears.*

## About Twenty Seven Co. Limited

Twenty Seven Co. (ASX: TSC) is an ASX-listed explorer. In brief, TSC's Australian assets are 100% owned and comprise two tenure groupings detailed briefly as follows:

**WA assets:** TSC's Rover project is located TSC's 140km west of Leonora in a base metals and gold mineral-rich area associated with mafic and ultramafic rocks. Historically the area is underexplored and is currently undergoing a resurgence in exploration.

**NSW assets:** TSC's two NSW projects – Midas and Perseus are targeting the prospective Thackaringa Group Rocks. TSC's Midas Project is located 40km NE of Broken Hill adjacent to Silver City Minerals (ASX: SCI) Yalcowinna Tenement. The Perseus Project is located 20km west of Broken Hill and is north of Alloy Resources (ASX: AYR) Ophara Project and to the east is the adjacent Havilah Resources (HAV.ASX) Kalkaroo Project.

**1. APPENDIX 1 The following tables are provided to ensure compliance with JORC Code (2012) requirements for exploration results for the Rover Project in WA.**

**1.1. Section 1 Sampling Techniques and Data to update**

1.2. (Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> <li><i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li> <li><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li><i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></li> </ul>	<ul style="list-style-type: none"> <li>No drilling reported in this release</li> <li>TSC is reporting a new airborne electromagnetic survey at the Rover project. The survey, flown by New Resolution Geophysics Australia (NRG), commenced on 18th of February 2020 and finished on the 26<sup>th</sup> of February 2020. The survey was flown over tenements E57/1085, and E57/1120.</li> <li>Airborne magnetic and electromagnetic data were acquired using NRG's Xcite™ Airborne Electromagnetic (AEM) system. In total, 590 line kms of data were collected along 300m spaced survey lines oriented at 65 degrees, including some infill lines to 150m.</li> <li>The Xcite™ system specifications are as follows: <ul style="list-style-type: none"> <li>➤ Sensor Configuration: Coincident Transmitter-Receiver [Tx-Rx] Altitude of Tx-Rx array: 30 to 40m</li> <li>➤ Tx loop diameter: 18.4m Tx number of turns: 4 Tx current: 235A</li> <li>➤ Tx Dipole Moment: 250, 000 NIA Tx Base frequency: 25 Hz</li> <li>➤ Receiver [Rx] Coils: X &amp; Z; concentric to Tx Rx diameter: 0.613m [X], 1.0m [Z]</li> <li>➤ Rx number of turns: 200 [X], 100 [Z] Altitude of helicopter: 60-70m</li> <li>➤ Altitude of magnetometer: mid-way between the bird [Tx-Rx array] and the helicopter.</li> <li>Acquisition System: NRG RDAS II</li> <li>➤ Measurements: dB/dT [integrated B-field]</li> </ul> </li> </ul>
Drilling techniques	<ul style="list-style-type: none"> <li><i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></li> </ul>	<ul style="list-style-type: none"> <li>No drilling reported in this release</li> </ul>
Drill sample recovery	<ul style="list-style-type: none"> <li><i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></li> </ul>	<ul style="list-style-type: none"> <li>No drilling reported in this release</li> </ul>

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	
Logging	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> </ul>	<ul style="list-style-type: none"> <li>No logging reported in this release</li> </ul>
	<ul style="list-style-type: none"> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> </ul>	<ul style="list-style-type: none"> <li>No logging reported in this release</li> </ul>
	<ul style="list-style-type: none"> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>No drilling reported in this release</li> </ul>
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>No drilling reported in this release</li> </ul>
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>Survey flown by New Resolution Geophysics (NRG) using a AS350B Series helicopter (or similar)</li> <li>EM System type: NRG Xcite™ with coincident Tx-Rx sensor configuration</li> <li>Transmitter: 18.4m diameter transmitter with 4 turns, 235A current, 250,000 NIA dipole movement, 25Hz base frequency</li> <li>Receiver: 0.613m (effective) (X), 1.0m (Z) diameter with 200 (X), 100 (Z) turns recording dB/dT and integrated B-field digitally at 625kbps</li> <li>Acquisition system: NRG RDAS II GPS System: Novatel DL-V3L1L2</li> <li>Magnetometer: single sensor Scintrex CS3 [airborne], NRG VER2 [base] Laser altimeter: SF11/C (Loop), SF00 (helicopter)</li> <li>Time gate windows: 0.04 ms to &gt; 11 ms</li> </ul>
