

23 SEPTEMBER 2020

ADDAVALE OBTAINS HISTORICAL EXPLORATION DATA AND TARGET GENERATION

- Company obtains historical United Nations Development Program and BHP nickel sulphide exploration data
- Analysis of data underway
- Data will assist Adavale to pinpoint Kabanga-type, ultramafic chonolith-hosted nickel sulphide exploration targets in the Kagera Nickel Belt

Adavale Resources Limited ('Adavale' or the 'Company') (ASX:ADD) is pleased to announce it has obtained a historical and comprehensive exploration data package. The package comprises a significant body of exploration work undertaken in Tanzania's Kagera Nickel Belt region between the mid-1970's and 2008.

The extensive data package covers much of the Kabanga / Kagera region and includes:

- Geochemical data including rock chip, soil and stream sediment sample results
- High-level results of geophysical programs
- Geological maps and reports
- Previous drilling results and drill logs
- Relevant geological interpretation and reports

All data is now being analysed by Adavale's geological team.

The Company has also engaged Mr Stephen Burke of Burke Geoscience Pty. Ltd. to assist Adavale with exploration target generation and exploration methodology. Mr Burke is a nickel sulphide exploration specialist and has experience evaluating the nickel sulphide exploration potential of the part of Tanzania in which the Company's tenements are located.

Adavale CEO Mr Allan Ritchie commented: "Adavale now has a wealth of relevant data which allows the Company to focus its exploration efforts on areas with the greatest exploration potential. This negates the need to spend valuable time and resources on broader regional exploration target generation, expediting the exploration path. In addition, Stephen's recognised expertise in nickel sulphide deposit petrogenesis and his intimate knowledge of the Kagera Nickel Belt will prove particularly useful over the coming months."

This announcement has been authorised for release by the Board of Adavale Resources Limited.
