

COMMENCEMENT OF NICKEL SULPHIDE FIELD EXPLORATION PROGRAM

HIGHLIGHTS:

- Adavale's geological team mobilised to site
- Planned fieldwork to confirm desktop study identified drilling targets
- Surface reconnaissance geological mapping, geochemical soil sampling, trenching and pitting to be conducted

Adavale Resources Limited ("Adavale" and or "Company") (ASX:ADD) is pleased to announce it mobilised its geological team to the Company's Kabanga prospecting licences to undertake an initial exploration program.

The Company utilised the recently acquired historical BHP exploration data to identify exploration drilling targets on both the Company's existing prospecting licences and its prospecting licences under application and pending approval. This initial field exploration program is designed to confirm geological targets and associated drill rig collar positions for the next stage of exploration.

This initial field exploration program will include but not be limited to surface reconnaissance geological mapping, geochemical soil sampling, trenching and pitting.

Two teams of geologists and geological technicians will manage all the planned exploration activities.

Adavale's CEO Allan Ritchie commented:

"This is the commencement of a very exciting period for the Company. Our prudent approach, commencing with the desktop study of data to define targets ensures this program is focussed, efficient and effective in terms of time, effort and expenditure. I look forward to updating shareholders on the results of this program."

Pictured is part of Adavale's geological team including:

2 x Senior Geologists
and a support crew of
Geotechnicians as well
as the mechanic / driver.
