Carpentaria-1 Operations Update

17 June 2021

Level 19, 20 Bond Street
Sydney NSW 2000

Empire Energy Group Limited (“Empire” or the “Company”) is pleased to provide an update to shareholders on the continuing positive progress at the Carpentaria-1 well in EP187. During initial clean up Empire has successfully flowed gas to surface as shown in the photo of gas flaring at Carpentaria-1 below.

The hydraulic fracture stimulation spread which completed the 4-stage program at Carpentaria-1 has been released and a coiled tubing unit is finishing the initial unload of fracture stimulation fluids from the well.

The Carpentaria-1 well gas contribution has steadily increased through the initial flow-back post fracture stimulation. Empire is preparing to run the production test completion into the well over the next few days in preparation for further well analysis and extended production rate testing.

Drone footage of gas flaring at the Carpentaria-1 location can be found at the Empire Energy Group Limited LinkedIn page.
