ASX RELEASE

9 November, 2021

ASX Code: CAE

EXCEPTIONAL, THICK COPPER INTERSECTIONS AT MT CANNINDAH IN HOLE 3 AGGREGATING TO 493m @ 1.17% Copper Equivalent (0.89% Cu, 0.26 g/t Au, 15.2 g/t Ag) FROM SURFACE..

HIGHLIGHTS

- **Cannindah Resources is pleased to announce that recent assay results from drillhole 21CAEDD003 have resulted in a major expansion to known copper , gold and silver mineralisation at its 100% owned Mt Cannindah project.**
- **The total aggregated extent of mineralisation from surface in hole # 3 amounts to :**
- **493m @ 1.17% Copper Equivalent,**
- **The significant copper, gold, silver mineralised zones can be divided into :**
- **A surface oxide zone (0m to 14m) leached of copper : 14m @ 0.4 g/t Au, 24 g/t Ag**
- **The supergene zone (14m to 33m) is enriched with copper : 19m @ 3.11%Cu, 0.74 g/t Au, 34 g/t Ag**
- **A supergene and upper primary zone (14m to 177m) : 163m @ 1.44 % Cu, 0.40 g/t Au, 36 g/t Ag.**
- **The upper primary zone contains significant intersections including :**
- **High grade primary zone (33m to 83m) : 50m @ 2.02%Cu, 0.75 g/t Au, 40 g/t Ag**
- **Wide chalcopyrite prominent zones eg. 32m @ 1.0% Cu, 28g/t Ag (83m to 115m)**
- **A lower primary zone (252m to 400m) : 148m @ 1.01% Cu, 0.22 g/ Au, 12.5 g/t Ag**
- **Hole 21CAEDD003 is testing the deep plunge of the copper mineralised zone at Mt Cannindah.**

Hole # 3 is nearly at a right angle to the direction drilled by hole 21CAEDD002, recently reported which returned significant intercepts aggregating to 282m @ 1.28% Copper Equivalent including :

117m @ 1.08% Cu, 0.38 g/t Au ,28 g/t Ag. (34m to 151m).

92m @ 1.2% Cu, 13.5 Ag, 0.3 g/t Au.(205m to 297m).

Cannindah Resources Limited ("Cannindah", "CAE") is pleased to announce the next set of assay results from the drilling program currently underway at Mt Cannindah, copper gold silver project south of Gladstone near Monto in central Queensland (Figs 1 to 3). This drilling program was planned such that it may extend the current JORC resource, as well as test the continuity of higher-grade copper zones within the project area, and possibly locate new areas of interest for follow up and potential in-fill drilling. CAE has made major revisions to the planned drilling after Intersecting copper mineralisation over hundreds (100s) of metres in the first 7 completed holes. (Figs 4).

As CAE have stated previously, these intervals highlight the success of holes within the current drilling program in confirming the continuity of higher-grade copper zones within the project area, with the potential to increase the current JORC resource.It is also worth noting that the Cannindah Infill breccia mineralisation carries significant silver and gold in addition to copper. The controls on the higher grade Au and Ag zones are still to be delineated.

Summary Highlights from the top of hole 21CAEDD003 include

From	To	m	Cu	Au	Ag	Comment
0.00	493.00	493.00	0.89	0.26	15.2	Note this includes some low Cu zones

which Incudes						
14.00	33.00	19.00	3.11	0.74	34.0	Supergene
33.00	83.00	50.00	2.02	0.75	40.1	Primary
lower intervals include						
252.00	400.00	148.00	1.01	0.22	12.5	Primary, Note this includes some low Cu zones

Table 1: Summary of Results - hole 21CAEDD003

Fig 4 shows hole 21CAEDD003 in plan in relation to historic holes. This hole was designed to test the plunge of the mineralisation to the west, it was drilled approximately west (260° magnetic), which is effectively 50 plus degrees different to the south-south-west (207° magnetic) bearing of hole 21CAEDD002. It is also drilling in the opposite direction to the previous (one hundred plus) Mt Cannindah historic holes. A significant point is that 21CAEDD003 confirms the continuity and extent of mineralisation in cross section (Fig 5), linking many of the mineralied zones intersected in previous holes drilled from the opposite direction. Significantly, hole 21CAEDD003 pushed on further down plunge to the west and discovered previously unknown or poorly delineated copper zones. This successful strategy led to the extension of hole 21CAEDD003 in order to establish the extent of the Mt Cannindah copper-gold -silver mineralised system down plunge. Eventually the hole was terminated at 762.6m, at the limit of the drill rig's capability. Although copper values had dropped off, chalcopyrite blebs are present. Sulphidic mineralised hydrothermal breccia is present at the end of the hole , just as it is in hole 21CAEDD002 which contains elevated silver at depth. In spite of drilling the Cannindah system to great depths, we have not reached the limit of the mineralisation, encountering shows of copper, elevated silver and extensive intrusive-driven alteration and sulphidic breccia to the bottom of all deep holes drilled to date. CAE are encouraged that results to date show that adopting this targeted drilling approach will find more copper, gold and silver at Mt Cannindah in the future.

Both holes 21CAEDD002 and now 21CAEDD003 significantly contribute to understanding the geometry , control and continuity of grade in the Cannindah Cu-Au-Ag Breccia deposit , essential to maximising the opportunity to expand upon the existing JORC resource.

The close relationship of observed chalcopyrite , chalcocite and Cu grade is shown in histogram form on the cross section in Fig 6. The table in the appendix lists the complete Cu,Au,Ag assays and pyrite , chalcopyrite, chalcocite visual estimates for first 493m of hole 21CAEDD003..

Figs 8 to 13 and core photos which illustrate the chalcocite rich supergene iand nfill chalcopyrite rich breccia zones accompanied by their assayed copper grades, distributed for 19m to 364m.

COMPETENT PERSON STATEMENT

The information in this report that relates to exploration results is based on information compiled by Dr. Simon D. Beams, a full-time employee of Terra Search Pty Ltd, geological consultants employed by Cannindah Resources Limited to carry out geological evaluation of the mineralisation potential of their Mt Cannindah Project, Queensland, Australia. Dr Beams is also a non-Executive Director of Cannindah Resources Limited.

Dr. Beams has BSc Honours and PhD degrees in geology; he is a Member of the Australasian Institute of Mining and Metallurgy (Member #107121) and a Member of the Australian Institute of Geoscientists (Member # 2689). Dr. Beams has sufficient relevant experience in respect to the style of mineralization, the type of deposit under consideration and the activity being undertaken to qualify as a Competent Person within the definition of the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves ("JORC Code).

Dr. Beams consents to the inclusion in the report of the matters based on this information in the form and context in which it appears.

Disclosure:

Dr Beams' employer Terra Search Pty Ltd holds ordinary shares in Cannindah Resources Limited.

Appendix 2: JORC Code Table 1 Cannindah Resources Limited announcement 9 November, 2021.

Section 1: Sampling Techniques and Data

Criteria	Explanation	Commentary
Sampling techniques	*Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.) These examples should not be taken as limiting the broad meaning of sampling.* *Include reference to measures taken to ensure sampling representivity and the appropriate calibration of any measurement tools or systems used.*	. Sampling results are based on sawn half core samples of both PQ ,HQ and NQ diameter diamond drill core. An orientation line was marked along all core sections. One side of the core was consistently sent for analysis and the other side was consistently retained for archive purposes. The orientation line was consistently preserved.
	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	Half core samples were sawn up on a diamond saw on a metre basis for HQ,NQ diameter core and a 0.5m basis for PQ diameter core. Samples were forwarded to commercial NATA standard laboratories for crushing, splitting and grinding ,Laboratory used in this instance is Intertek Genalysis , Townsville. Analytical sample size was in the order of 2.5kg to 3kg.
Drilling techniques	*Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.)*	Drill type is diamond core. Core diameter at top of hole is PQ, below 30m core diameter is HQ and NQ.Triple tube methodology was deployed for PQ & HQ, which resulted in excellent core recovery throughout the hole.Core was oriented , utilizing an Ace Orientaion equipment and rigorously supervised by on-site geologist.
Drill sample recovery	*Method of recording and assessing core and chip sample recoveries and results assessed.*	Core recovery was recorded for all drill runs and documented in a Geotechnical log. The Triple Tube technology and procedure ensured core recoveries were excellent throughout the hole.
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	Triple tube methodology ensure excellent core recoveries. Core was marked up in metre lengths and reconciled with drillers core blocks. An orientation line was drawn on the core . Core sampling was undertaken by an experienced operator who ensured that half core was sawn up

Criteria	Explanation	Commentary
		with one side consistently sent for analysis and the other side was consistently retained for archive purposes. The orientation line was consistently preserved.
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	Core recoveries were good. An unbiased , consistent half core section was submitted for the entire hole, on the basis of continuous 1m sampling. 0.5m in the case of PQ.The entire half core section was crushed at the lab and then split , The representative subsample was then fine ground and a representative unbiased sample was extracted for further analysis.
Logging	*Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies*	Geological logging was carried out by well-trained/experienced geologist and data entered via a well-developed logging system designed to capture descriptive geology, coded geology and quantifiable geology. All logs were checked for consistency by the Principal Geologist. Data captured through Excel spread sheets and Explorer 3 Relational Data Base Management System. A geotechnical log was prepared.
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel etc.) photography.	Logging was qualitative in nature. A detailed log was described on the basis of visual observations. A comprehensive Core photograph catalogue was completed with full core dry, full core wet and half core wet photos taken of all core.
	The total length and percentage of the relevant intersections logged.	The entire length of all drill holes has been geologically logged.
Sub-sampling techniques and sample preparation	*If core, whether cut or sawn and whether quarter, half or all core taken.*	Half core samples were sawn up on a diamond saw on a metre basis for HQ, NQ diameter core and a 0.5m basis for PQ diameter core. . .
	If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.	All sampling was of diamond core
	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	The above techniques are considered to be of a high quality, and appropriate for the nature of mineralisation anticipated.
	Quality control procedures adopted for all sub-sampling stages to maximise representativity of samples.	QA/QC protocols were instigated such that they conform to mineral industry standards and are compliant with the JORC code. Terra Search's input into the Quality Assurance (QA) process with respect to chemical analysis of mineral exploration diamond core samples includes the addition of blanks, standards to each batch so that checks can be done after they are analysed. As part of the Quality Control (QC) process, Terra Search checks the resultant assay data against known or previously determined assays to determine the quality of the analysed batch of samples. An assessment is made on

Criteria	Explanation	Commentary
		the data and a report on the quality of the data is compiled.
	Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.	The lab results are checked against visual estimations and PXRF sampling of sludge and coarse crush material.
	Whether sample sizes are appropriate to the grain size of the material being sampled.	The standard 2kg -5kg sample is more than appropriate for the grainsize of the rock-types and sulphide grainsize. The sample sizes are considered to be appropriate to represent the style of the mineralisation, the thickness and consistency of the intersections.
Quality of assay data and laboratory tests	*The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.*	After crushing splitting and grinding at Intertek/Genalysis lab Townsville samples were assayed for gold using the 50g fire assay method The primary assay method used is designed to measure both the total gold in the sample as per classic fire assay. The total amount of economic metals tied up in sulphides and oxides such as Cu, Pb, Zn, Ag, As, Mo, Bi,S is captured by the 4 acid digest method ICP finish. This is regarded as a total digest method and is checked against QA-QC procedures which also emploty these total techniques. Major elements which are present in silicates, such as K, Ca, Fe, Ti, Al, Mg are also digested by the 4 acid digest Total method. The techniques are considered to be entirely appropriate for the porphyry, skarn and vein style deposits in the area. The economically important elements in these deposits are contained in sulphides which is liberated by 4 acid digest, all gold is determined with a classic fire assay.
	For geophysical tools, spectrometers, handheld XRF instruments, etc. the parameters used in determining the analysis including instrument make and model, reading times, calibration factors applied and their derivation, etc.	Magnetic susceptibility measurements utilizing Exploranium KT10 instrument, zeroed between each measurement. No PXRF results are reported here. although PXRF analysis has been utilized to provide multi-element data for the prospect and will be reported separately. The lab pulps are considered more than appropriate samples for this purpose. PXRF Analysis is carried out in an air-conditioned controlled environment in Terra Search offices in Townsville. The instrument used was Terra Search's portable Niton XRF analyser (Niton 'trugeo' analytical mode) analysing for a suite of 40 major and minor elements. in. The PXRF equipment is set up on a bench and the sub-sample (loose powder in a thin clear plastic freezer bag) is placed in a

Criteria	Explanation	Commentary
		lead-lined stand. An internal detector autocalibrates the portable machine, and Terra Search standard practice is to instigate recalibration of the equipment every 2 to 3 hours. Readings are undertaken for 60 seconds on a circular area of approximately 1cm diameter. A higher number of measurements are taken from the centre of the circle and decreasing outwards. PXRF measures total concentration of particular elements in the sample. Reading of the X-Ray spectra is effected by interferences between different elements. The matrix of the sample eg iron content has to be taken into account when interpreting the spectra. The reliability and accuracy of the PXRF results are checked regularly by reference to known standards. There are some known interferences relevant to particular elements eg W & Au; Th & Bi, Fe & Co. Awareness of these interferences is taken into account when assessing the results.
	Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	QAQC samples are monitored on a batch-by-batch basis, Terra Search has well established sampling protocols including blanks, certified reference material, and in-house standards which are matrix matched against the samples in the program. Terra Search quality control included determinations on certified OREAS samples and analyses on duplicate samples interspersed at regular intervals through the sample suite of both the commercial laboratory batch. .Standards were checked and found to be within acceptable tolerances. Laboratory assay results for these quality control samples are within 5% of accepted values.
Verification of sampling and assaying	*The verification of significant intersections by either independent or alternative company personnel.*	Significant intersections were verified by Terra Search Pty Ltd, geological consultants who conducted drilling. Validation is checked by comparing assay results with logged mineralogy eg sulphide material in relation to copper and gold gradse.
	The use of twinned holes.	There has been little direct twinning of holes, the hole reported here pass close to earlier drill holes , assay results and geology are entirely consisted with previous results. .
	Documentation of primary data, data entry procedures, data verifications, data storage (physical and electronic) protocols.	Data is collected by qualified geologists and experienced field assistants and entered into excel spreadsheets.

Criteria	Explanation	Commentary
		Data is imported into database tables from the Excel spreadsheets with validation checks set on different fields. Data is then checked thoroughly by the Operations Geologist for errors. Accuracy of drilling data is then validated when imported into MapInfo. Location and analysis data are then collated into a single Excel spreadsheet. Data is stored on servers in the Consultants office and also with CAE. There have been regular backups and archival copies of the database made. Data is also stored at Terra Search's Townsville Office. Data is validated by long-standing procedures within Excel Spreadsheets and Explorer 3 data base and spatially validated within MapInfo GIS.
	Discuss any adjustment to assay data.	No adjustments are made to the Commercial lab assay data. Data is imported into the database in its original raw format.
Location of data points	*Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.*	Collar location information was originally collected with a Garmin 76 hand held GPS. X-Y accuracy is estimated at 3-5m, whereas height is +/- 10m.Coorinates will be reassessed with DGPS survey. Down hole surveys were conducted on all holes using a Reflex downhole digital camera . Surveys were generally taken every 30m downhole , dip, magnetic azimuth and magnetic field were recorded.
	Specification of the grid system used.	Coordinate system is UTM Zone 55 (MGA) and datum is GDA94
	Quality and adequacy of topographic control.	Pre-existing DTM is high quality and available.
Data spacing and distribution	*Data spacing for reporting of Exploration Results.*	At the Mt Cannindah mine area previous drilling program total over 100 deep diamond and Reverse Circulation percussion holes.. Almost all have been drilled in 25m to 50m spaced fences , from west to east, variously positioned over a strike length of 350m and a cross strike width of at least 500m.. Down hole sample spacing is in the order of 1m to 2m which is entirely appropriate for the style of the deposit and sampling procedures.
	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	Previous resource estimates on Mt Cannindah include Golders 2008 for Queensland Ores and Helman & Schofield 2o12 for Drummond Gold. Both these estimates utilised 25m to 50m fences of west to east drillholes, but expressed concerns regarding confidence in assay continuity both between 50m sections and between holes within the plane of the cross

Criteria	Explanation	Commentary
		sections. The hole reported here addresses some of the concerns about grade continuity, by linking mineralisation from section to section and also in the plane of the cross sections. Further drilling is necessary to enhance and fine tune the previous Mineral Resource. estimates at Mt Cannindah and lift the category from Inferred to Indicated and Measured and compliant with JORC 2012. .
	Whether sample compositing has been applied.	No sample compositing has been applied, Most are 0.5m to 1m downhole samples..
Orientation of data in relation to geological structure	*Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.*	The main objective of hole 21CAEDD003, reported here is to establish grade continuity down plunge,.. The hole is oriented within the 100m plus-wide infill breccia zone at Mt Cannindah. The hole was drilled to the west (260 mag azimuth) , the Infill breccia is massive textured and clasts and matrix have a generally random, non-preferred orientation . Pre and post mineral dykes cut the drill hole , generally in two orientations , east west, semi-parallel to the hole , and north south , right angles to the hole.
	If the relationship between drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	As the infill breccia is massive textured and clasts and matrix infill have a generally random, non-preferred orientation, no sampling bias is evident in the logging, or the presentation of results or drill cross and long sections.The breccia zone at Mt Cannindah is of sufficient width and depth that drillhole 21CAEDD003 provides valuable unbiased information concerning grade continuity of the breccia body. The complete geometry of the breccia body is unknown at this stage.
Sample security	*The measures taken to ensure sample security.*	Chain of custody was managed by Terra Search Pty Ltd. Core trays were freighted in sealed pallets from Monto were they were dispatched by Terra Search . The core was processed and sawn in Terra Search's Townsville facilities and half core samples were delivered by Terra Search to Intertek/Genalysis laboratory Townsville lab.
Audits or reviews	*The results of any audits or reviews of sampling techniques and data.*	There have been numerous independent reviews carried out on the Mt Cannindah project reviewing sampling, data sets, geological controls, the most notable ones are Newcrest circa 1996; Coolgardie Gold1999; Queensland Ores 2008;Metallica ,2008; Drummond Gold, 2011; CAE 2014.

APPENDIX 3 – JORC Code Table 2

Section 2: Reporting of Exploration Results

Mineral tenement and land tenure status	*Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national and environmental settings.*	Exploration conducted on MLs 2301, 2302, 2303, 2304, 2307, 2308, 2309, EPM 14524, and EPM 15261. 100% owned by Cannindah Resources Pty Ltd. The MLs were acquired in 2002 by Queensland Ores Limited (QOL), a precursor company to Cannindah Resources Limited. QOL acquired the Cannindah Mining Leases from the previous owners, Newcrest and MIM, As part of the purchase arrangement a 1.5% net smelter return (NSR) royalty on any production is payable to MIM/Newcrest and will be shared 40% by MIM and 60% by Newcrest. An access agreement with the current landholders in in place.
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a license to operate in the area.	No impediments to operate are known.
Exploration done by other parties	*Acknowledgement and appraisal of exploration by other parties.*	Previous exploration has been conducted by multiple companies. Data used for evaluating the Mt Cannindah project include : Drilling & geology, surface sampling by MIM (1970 onwards) drilling data Astrik (1987), Drill,Soil, IP & ground magnetics and geology data collected by Newcrest (1994-1996), rock chips collected by Dominion (1992),. Drilling data collected by Coolgardie Gold (1999), Queensland Ores (2008-2011), Planet Metals-Drummond Gold (2011-2013) . Since 2014 Terra Search Pty Ltd, Townsville QLD has provided geological consultant support to Cannindah Resources.
Geology	*Deposit type, geological setting and style of mineralisation.*	Breccia and porphyry intrusive related Cu-Au-Ag-Mo , base metal skarns and shear hosted Au bearing quartz veins occur adjacent to a Cu-Mo porphyry.
Drill hole information	*A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* • *Easting and northing of the drill hole collar* • *Elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* • *Dip and azimuth of the hole*	A major drill data base exists for the Mt Cannindah district amounting to over 400 holes. Selected Cu and Au down hole intervals of interest have been listed in CAE's ASX announcement, March,2021.

	• *Down hole length and interception depth* • *Hole length* *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	
Data aggregation methods	*In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.*	No cut-offs have been routinely applied in reporting of the historical drill results or the drillhole 21CAEDD002 reported here.
	Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations be shown in detail	The Cu-Au-Ag breccia style mineralisation at Mt Cannindah is developed over considerable downhole lengths. The breccia is generally mineralised, although copper grade and sulphide content is variable. In addition pre and post mineral dykes and intrusive bodies can mask the mineralisation .Down hole Cu-Au-Ag intercepts have been quoted both as a semi-continuous, aggregated down hole interval and also as tighter higher grade Cu-Au-Ag sections. In addition, historical results have been reported in the aggregated form displayed in the ASX Announcement for CAE , March,2021, many times previously. There are some zones of high grade which can influence the longer intercepts, however the variance in copper and gold grade is generally of a low order..
	The assumptions used for any reporting of metal equivalent values should be clearly stated.	A copper equivalent has been used to report the wider intercept that carries Au and Ag credits with copper being dominant. Only raw economic values have been used based on current metal prices. No formal metallurgical work is available for Mt Cannindah at this stage , so metal recoveries have not been used in the copper equivalent calculation. 30 day average prices in USD for October,2021, have been used for Cu, Au , Ag , specifically copper @ USD$9250/tonne, gold @ USD$1750/oz and silver @ USD$23/oz.
Relationship between mineralisation widths and intercept lengths	*The relationships are particularly important in the reporting of Exploration Results.* *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported* *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. down hole length, true width not known).*	21CAEDD002 reported here is oriented across the strike of the 100m plus-wide infill breccia zone at Mt Cannindah. The hole was drilled to the west (260 mag azimuth) , the Infill breccia is massive textured and clasts and matrix have a generally random, non-preferred orientation . Pre and post mineral dykes cut the drill hole , generally in two orientations , north south, semi-parallel to the hole , and east west , right angles to the hole. Previous resource estimations at

		Mt Cannindah model the breccia body as elongated NNE-SSW and at least 100m plus thick in an east west direction. Previous estimations indicate a potentially depth extension to 350m plus.. The breccia body geometry, as modelled at surface has the long axis oriented NNE-SSW which is right angles to hole 21CAEDD003 reported here. In this context , this hole is drilled down the plunge of the breccia body with the potential true width of the body oriented at an oblique ange to hole 21CAEDD003. However, geological consultants, Terra Search argue that the dimensions of the mineralised body are uncertain , the longest axis could well be plunging to greater depths, and the upper and lower contacts are still to be firmly established. ,
Diagrams	*Appropriate maps and sections (with scale) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	Sections and plans of the drillhole 21CAEDD003 reported here are included in this report.Geological data is still beging assembled at the time of this report.
Balanced reporting	*Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practised to avoid misleading reporting of Exploration Results.*	All Cu,Au,Ag assays from the 0m to 493m section of hole 21CAEDD003 are listed with this report. Significant intercepts are tabulated. All holes were sampled over their entire length,Reported intercepts have been aggregated where mineralization extends over significant down hole widths. This aggregation has allowed for the order of 10m non mineralized late dykes or lower grade breccia sections.to be incorporated within the reported intersections. .
Other substantive exploration data	*Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	The latest drill results from the Mt Cannindah project are reported here. The report concentrates on the Cu,Au, Ag results. Other data, although not material to this update will be collected and reported in due course.
Further work	*The nature and scale of planned further work (e.g. test for lateral extensions or depth extensions or large-scale step-out drilling).*	Drill targets are identified and further drilling is required. Drilling has continued after the completion of hole 21CAEDD003. To date a further 4 holes have been drilled Other drilling is planned at Mt Cannindah Breccia.
	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Not yet determined, further work is being conducted.

APPENDIX 4– JORC Code Table 2

Section 3: Estimation and Reporting of Mineral Resources

Audits or Review	*The results of audits and reviews of any ore resource Estimates.*	There have been several resource estimations made over the various deposits at Mt Cannindah. These have been in the public domain for a number of years. The most recent resource statement by by Hellman & Schofield in 2011 is for Drummond Gold on the resource at Mt Cannindah itself. This was reported under the JORC 2004 code and has not been updated to comply with JORC 2012 on the basis that the information has not materially changed since it was last reported. T\he resource statement from the Drummond Gold 2013 report is set out below. **Mt Cannindah (Hellman & Schofield for Drummond Gold,2011**) **JORC,2004**

Deposit Area	**Mt Cannindah**						
Source	Hellman & Schofield 2011 Using JORC 2004				Estimated indicative contained In situ Metal		
Category	**Tonnage**	**Copper %**	**Gold g/t**	**Silver g/t**	**Cu tonnes**	**Au ozs**	**Ag ozs**
