ASX Announcement
24 November 2021

Spectacular Gold Intercepts at Rosella

Results up to 27.0g/t Au from ongoing open-pit focused drill campaign

Highlights

- **Results received from drilling at the Rosella and Exocet open pits as part of Vango's 2021 open-pit focused drilling campaign**
- **Drilling has returned spectacular results at Rosella including:**
  - **1m at 4.0 g/t Au from 54m in VRORC0001**
  - **3m at 10.0 g/t Au from 80m in VRORC0001 incl 1m @ 27.0 g/t Au from 80m**
  - **11m at 4 g/t Au from 83m in VRORC0004 incl. 6m at 6.6 g/t Au from 85m**
- **These results are in addition to un-mined historical intercepts at Rosella which include:**
  - **8m at 10.5 g/t Au from 44m in RODD0062**
  - **7m at 5.3 g/t Au from 83m in RORC0031 incl. 1m at 29.7 g/t Au from 86m**
  - **2m at 4.4 g/t Au from 24m in PBP01339**
  - **5m at 2.8 g/t Au from 71m in PBR1749**
  - **5m at 5.4 g/t Au from 59m in PBRC0022 incl. 3m at 1.4 g/t Au from 61m**
  - **8m at 3.6 g/t Au from 69m in RORC0030**
  - **12m at 2.1 g/t Au from 76m in RORC0032**
  - **8m at 3.7 g/t Au from 81m in RORC0034**
- **Rosella is interpreted as a faulted-off continuation of the adjacent Parrot Open-Pit, offering potential for large-scale open-pit development and mining – Parrot results include:** (ASX announcement, 20 October 2021)
  - **3m @ 1.3 g/t Au from 124m in VPARC0002**
  - **1m @ 2.5 g/t Au from 177m in VPARC0001**
  - **12m @ 2.6 g/t Au from 43m in PARC0073**
  - **2m @ 11.1 g/t Au from 99m in PBR7977**
  - **8m @ 1.6 g/t Au from 67m in PBRD1753**
- **Results add to the Resource upgrade potential at the Marymia Gold Project – resource upgrade planned following completion of all open-pit focused drilling**
- **Results from the final 2 holes at Rosella and from the other phase 1 drilling completed to date are pending and will be released when available**

Vango Mining Limited (Vango, ASX: VAN) is pleased to announce exceptional gold intersections from its ongoing open-pit focused drilling campaign at the Company's flagship Marymia Gold Project (Marymia, the Project) in the Mid-West region of Western Australia.

The latest results are from three holes drilled at the Rosella open-pit target and five holes drilled at the Exocet open-pit area. Results from a further two holes at Rosella are pending.

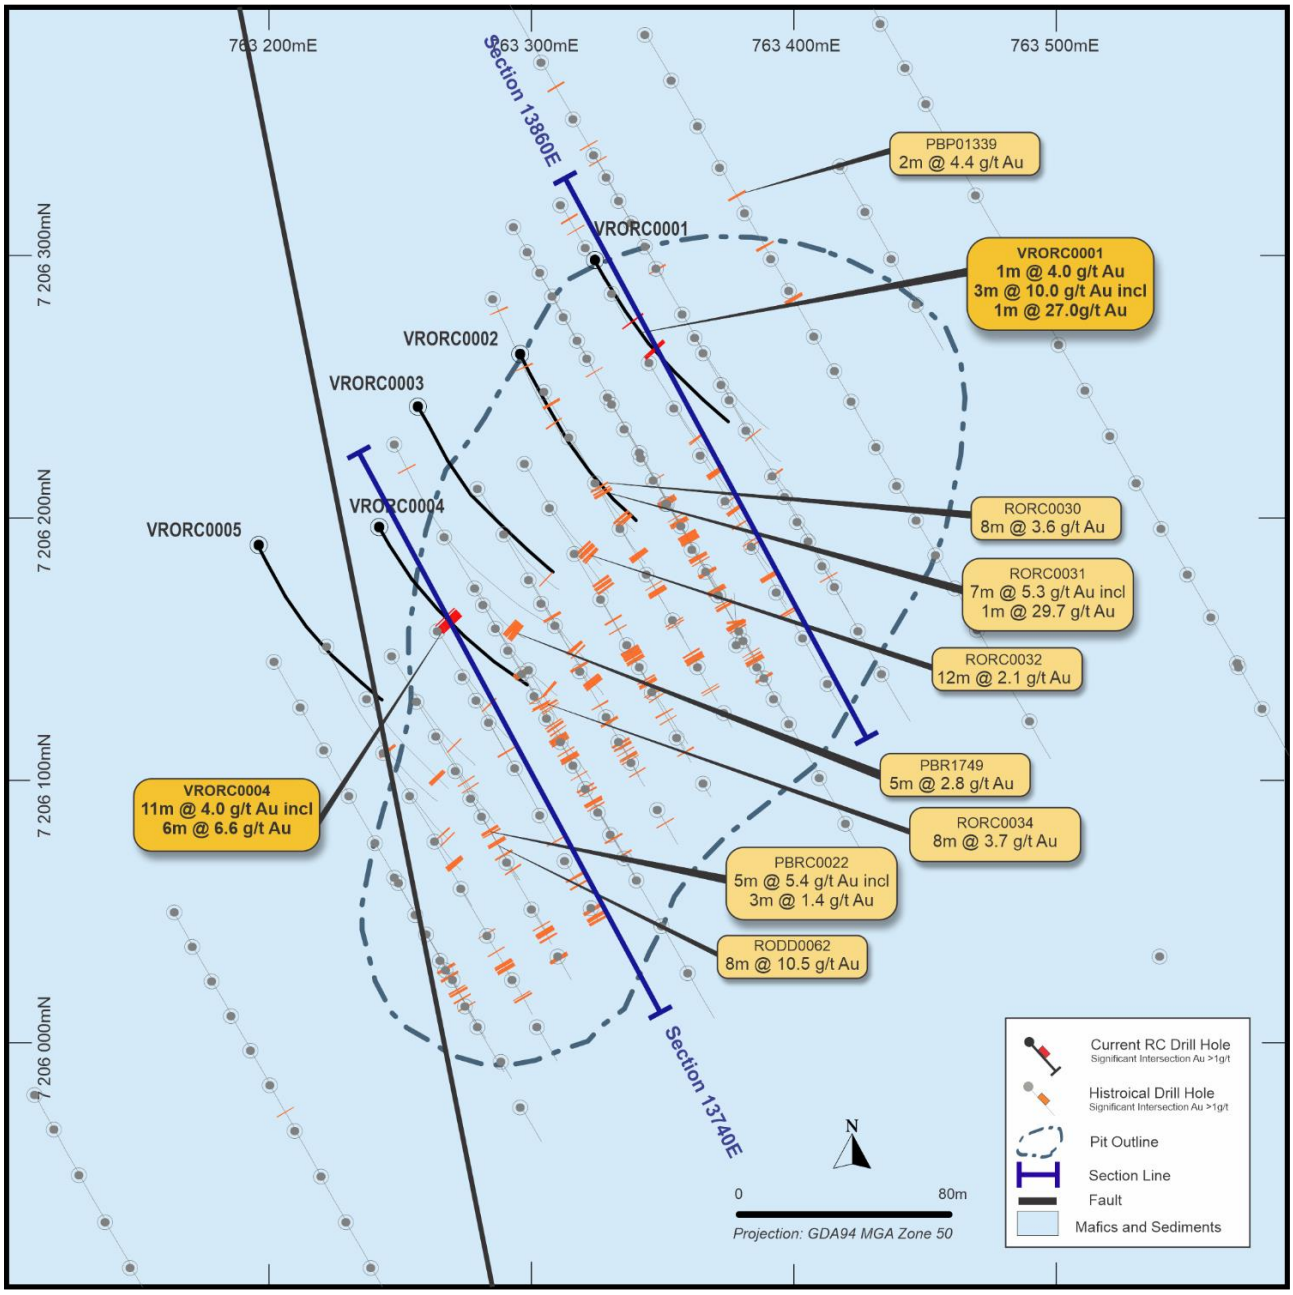

Figure 1 Plan View Rosella Pit Area

Rosella Open Pit

Rosella is interpreted to be a faulted-off continuation of the Parrot Open Pit. It hosts well-defined gold mineralisation along a moderately north-west dipping structure within mafics and near the contact, with sediments in places. Previous drilling below the existing Rosella pit has shown great potential and Vango's current drilling was designed to test for continuity of gold mineralisation at depth. This drilling has been highly successful, and the results have validated the Company's exploration approach (Figures 1, 2 and 3).

Results from three holes have been received to date, and holes VRORC0001 and VRORC0004 intersected impressive gold with the best intersections detailed here:

- **1m at 4.0 g/t Au from 54m in VRORC0001**
- **3m at 10.0 g/t Au from 80m in VRORC0001 incl 1m @ 27.0 g/t Au from 80m**
- **11m at 4 g/t Au from 83m in VRORC0004 incl. 6m at 6.6 g/t Au from 85m**

These results extend the known gold zones significantly and add to the existing historical intercepts from below the current pit, which include:

- **8m at 10.5 g/t Au from 44m in RODD0062**
- **7m at 5.3 g/t Au from 83m in RORC0031 incl. 1m at 29.7 g/t Au from 86m**
- **2m at 4.4 g/t Au from 24m in PBP01339**
- **5m at 2.8 g/t Au from 71m in PBR1749**
- **5m at 5.4 g/t Au from 59m in PBRC0022 incl. 3m at 1.4 g/t Au from 61m**
- **8m at 3.6 g/t Au from 69m in RORC0030**
- **12m at 2.1 g/t Au from 76m in RORC0032**
- **8m at 3.7 g/t Au from 81m in RORC0034**

Assays from holes VRORC0002 and 0003 are pending, and hole VRORC0005 is interpreted to have drilled to the south of the late fault that separated Parrot and Rosella.

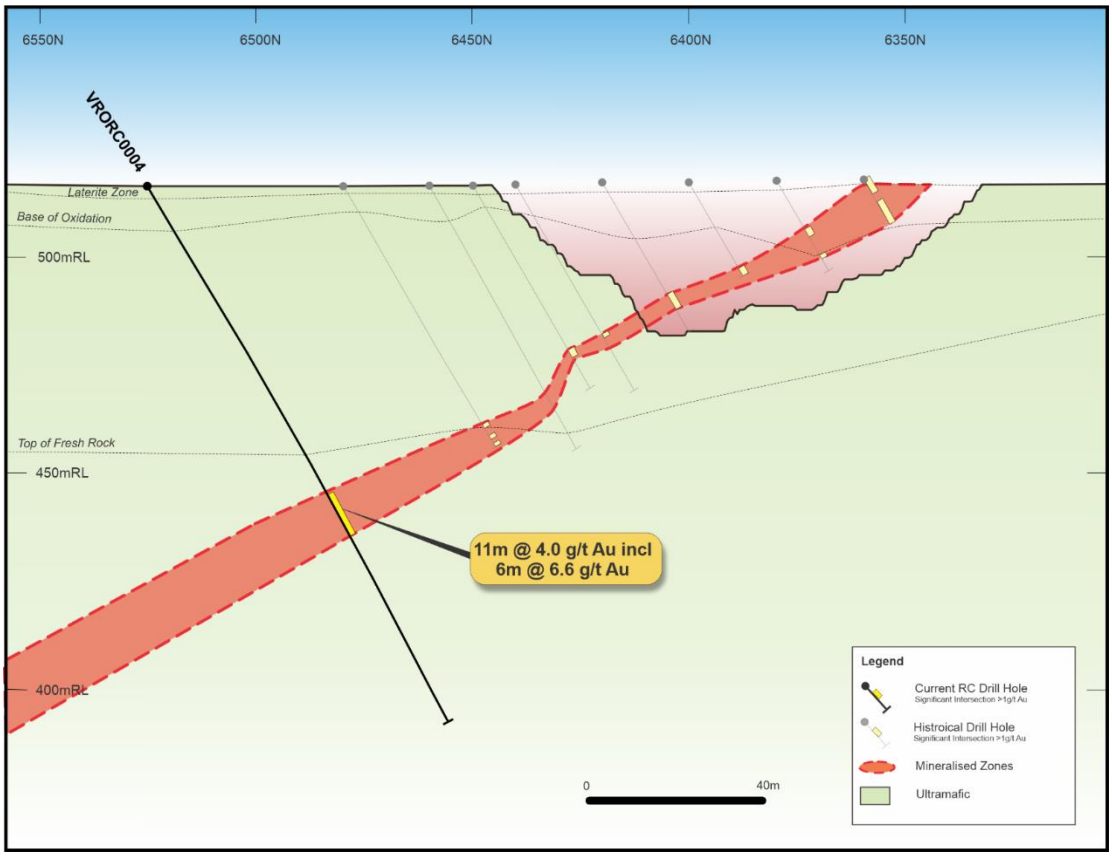

Figure 2 Cross-section Rosella 13740E

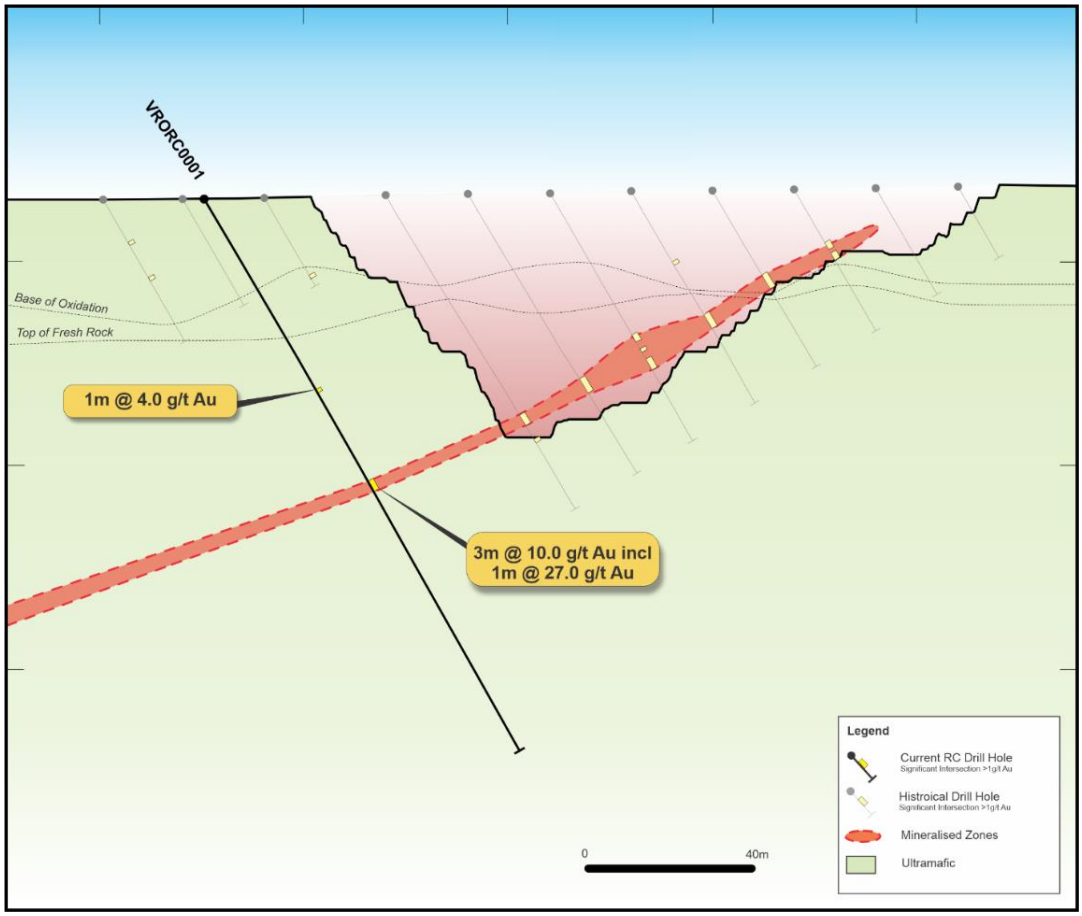

Figure 3 Rosella Cross-section 13860E

Exocet

- **At Exocet 4 of 5 holes drilled intercepted significant gold within an interpreted low angle thrust – these results complement historical intercepts from drilling outside the Exocet pit**

Drilling at Exocet was designed to test below and adjacent to the historical pit. There is significant potential at depth and to the north-east of these historical workings. The mineralisation appears to follow low angle thrust structures in the area and is hosted within ultramafics in the most part.

Vango's drilling to date consisted of five holes to define the continuity of the mineralised structures at depth. Results have confirmed these systems do continue to depth:

- **1m at 1.1 g/t Au from 83m in VEXRC0001**
- **6m at 1.3 g/t Au from 68m in VEXRC0002 incl. 1m at 3.7 g/t Au from 72m**
- **1m at 2.8 g/t Au from 97m in VEXRC0002**
- **2m at 0.8 g/t Au from 55m in VEXRC0003**
- **3m at 0.9 g/t Au from 71m in VEXRC0003 incl. 1m at 1.1 g/t Au from 72m**
- **1m at 5.2 g/t Au from 135m in VEXRC0004**

These results are surrounded by historical intercepts outside of the initial pit, which have the potential to define a mineable resource. Highlight results included:

- **6m at 2.1 g/t Au from 61m in EXRC0011 incl. 1m at 9.3 g/t Au from 61m**
- **9m at 2.9 g/t Au from 48m in EXRC0033 incl. 2m at 9.9 g/t Au from 49m**
- **10m at 3.0 g/t Au from 68m in EXRC0036**
- **15m at 1.6 g/t Au from 56m in EXRC0171 incl. 2m at 6.8 g/t Au from 56m**
- **12m at 1.4 g/t Au from 11m in EXRC0271 incl. 2m at 3.8 g/t Au from 16m**
- **11m at 2.3 g/t Au from 37m in EXRC0274**
- **3m at 3.0 g/t Au from 31m in EXRC0379**
- **12m at 1.8 g/t Au from 37m in EXRC0380 incl. 2m at 3.8 g/t Au from 37m**
- **6m at 3.7 g/t Au from 41m in EXRC0385**
- **9m at 1.8 g/t Au from 42m in EXRC0390**
- **15m at 2.1 g/t Au from 27m in EXRC0412**

There are some intercepts to the north-east that may provide another economic zone (EXRC0033 and EXRC0036, Figure 4).

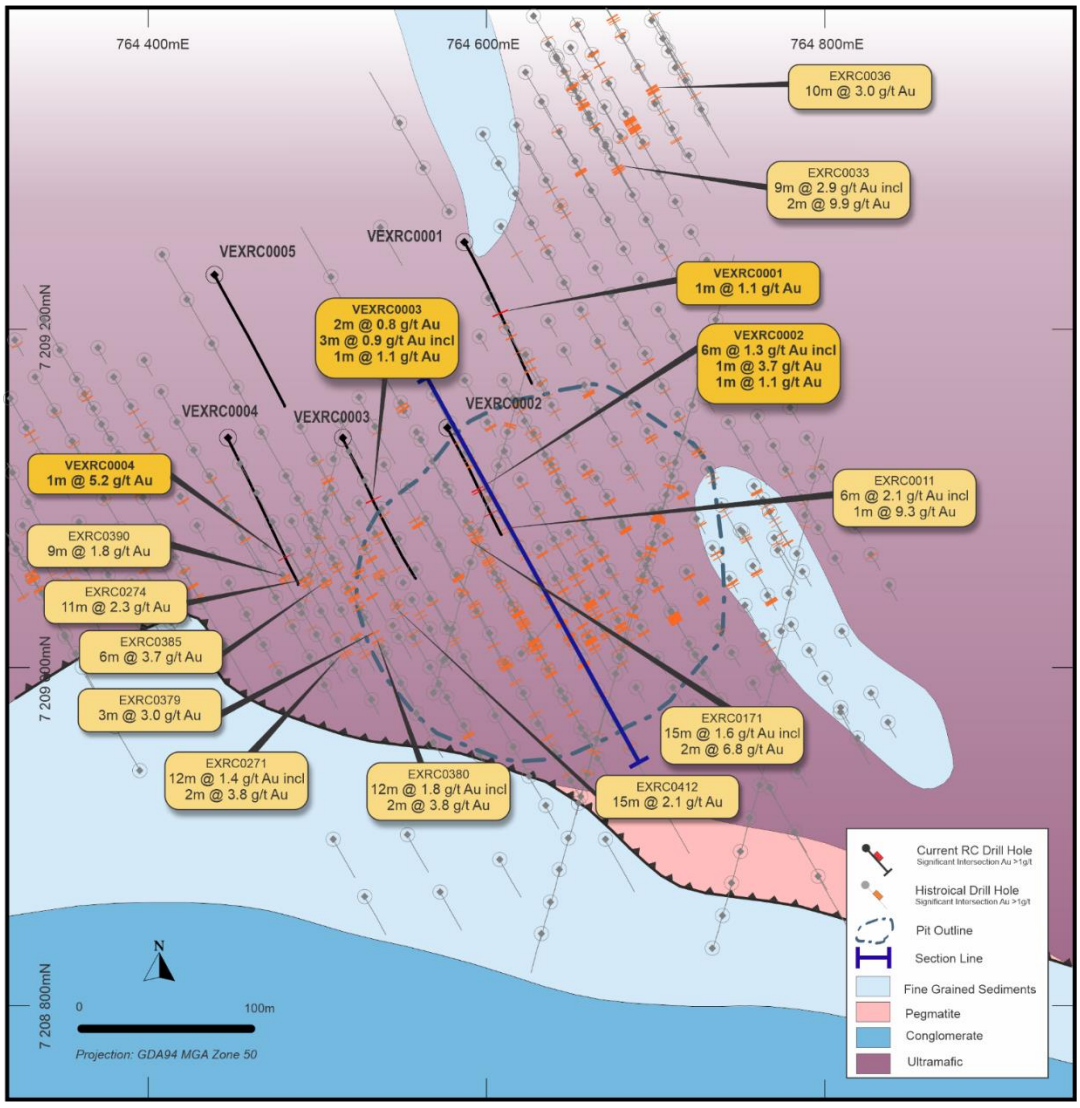

Figure 4 Exocet Plan view showing historical and current drilling

Note in the cross section in Figure 5 that the low angle thrust has some extensions to mineralisation in the supergene zone.

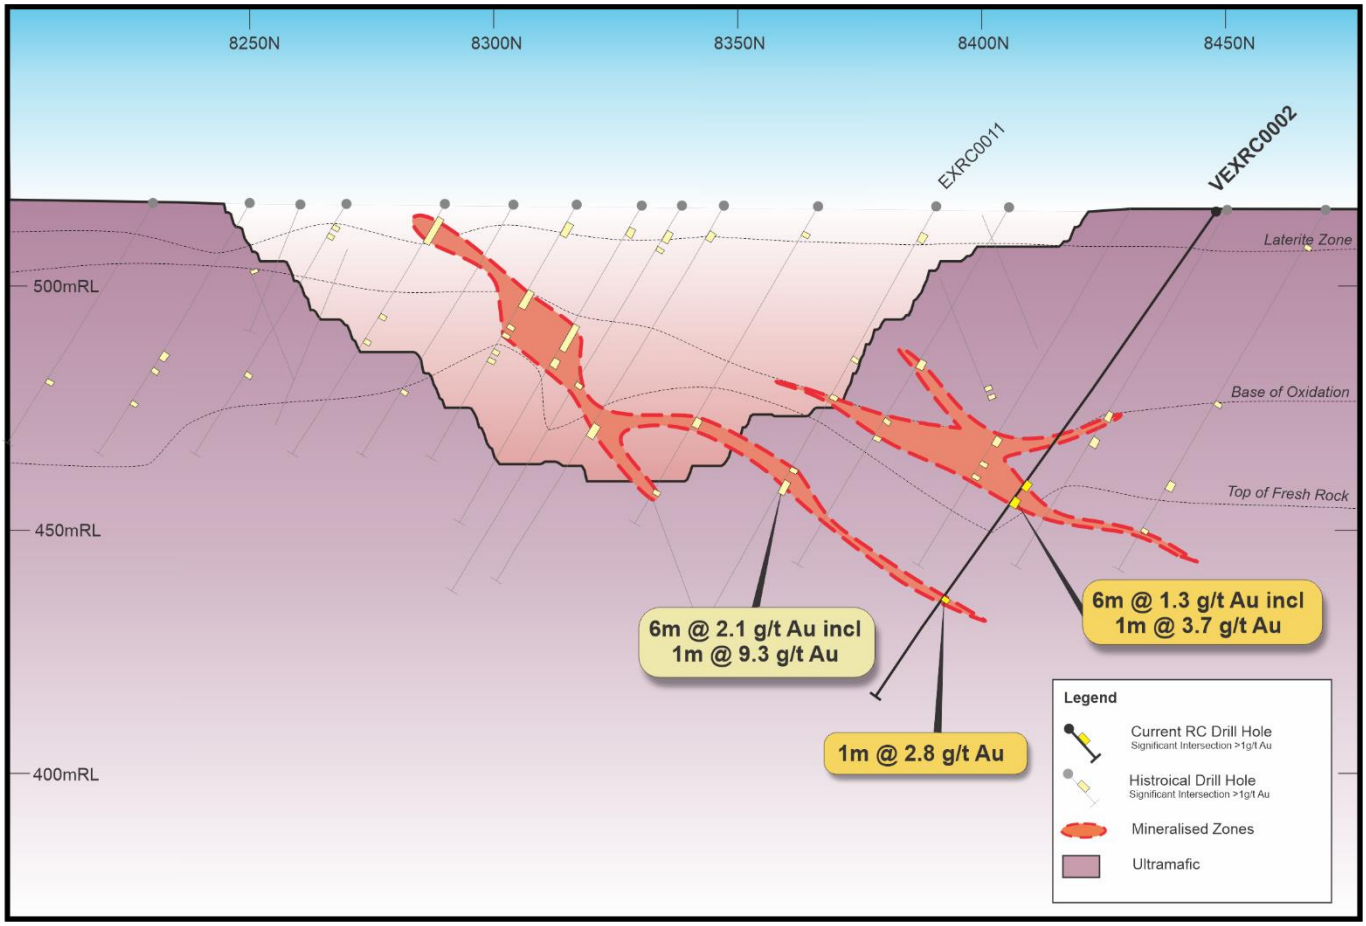

Figure 5 Cross section through 16340E Exocet

2021 Drilling Campaign Progress and Next Steps

Vango is targeting 11 priority open-pits in its 2021 drilling campaign (Figure 6). Drilling is designed to add resources to the substantial existing Marymia resource base, and to deliver 'critical mass' to Marymia's resource base to support a proposed stand-alone mining operation at the Project.

The first phase of drilling in all 11 open pits has now been completed and consisted of 8,914 metres of RC drilling across 56 holes. All results have now been reported from first-phase drilling at the Skyhawk, Parrot, Apollo, Prickleys, Ibis and Exocet open pits along with the first three holes from Rosella. Results from drilling at the remaining four open-pits will be progressively released as they become available.

Vango plans to conduct a follow-up, second phase of drilling at all targets that deliver positive results from the completed first round of drilling, to test for further extensions of gold mineralisation to add to the Marymia resource base.

The Company confirms that it is not aware of any new information that materially affects the information included in the original market announcements and that all material assumptions and technical parameters underpinning the estimates in the relevant market announcements continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Persons' findings are presented have not been materially modified from the original market announcements.

About Vango Mining

Vango Mining Limited (ASX: VAN) is a minerals exploration mining company with ambitions of becoming a high-grade WA gold miner by developing the 100% owned Marymia Gold Project (**Marymia**) in the mid-west region of Western Australia. The Project comprises 45 granted mining leases over an area of 325.08km^2.) It has an established high-grade resource of 1Moz @ 3g/t Au^, underpinned by the Trident Deposit, whose resource is 410koz @ 8g/t Au, with immediate extensions open at depth/along strike.

The Marymia Project has the potential to become a significant Australian high-grade producer. The Greenstone Belt in the Marymia region includes six major gold corridors, which remain largely un-tested beyond 100m depth - supported with an extensive drilling and geophysical database. Previous mining between 1992-2001, produced 580,000 ounces of gold almost entirely from open-pits.

Vango is focused on growing its high-grade gold resource to support a proposed stand-alone gold mining and production operation at Marymia. The Project is located along strike, immediately to the north of Superior Gold's (TSX-V: SGI) Plutonic Gold Mine which has produced more than 5.5Moz of gold[1].

* VAN confirms all material assumptions and technical parameters underpinning the Resource Estimate and Reserve continue to apply, and have not materially changed as per Listing Rule 5.23.2

Mineral Resources reported in accordance with the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (Joint Ore Reserves Committee Code – JORC 2012 Edition). Open pit resources reported within optimised conceptual pit shells at A$2,500/oz gold price above a 0.5 g/t Au cut off and include oxide, transition and fresh material.

Trident underground resources are retained as first reported 18 April 2019[1] above a 3.0 g/t Au cut-off grade, and modelled at a gold price of A$2,000/oz, on the basis that the information has not materially changed since last reported. Other underground resources reported above a 3.0 g/t Au cut off (with minor 2.5 g/t Au cut-off material included for continuity purposes) and includes fresh material only. Totals may differ due to rounding, Mineral Resources reported on a dry in-situ basis.

Competent Persons Statements

The Statement of Mineral Resource Estimates has been compiled by Dr. Spero Carras who is a full-time employee of Carras Mining Pty Ltd and a Fellow of the Australian Institute of Mining and Metallurgy ("FAusIMM"). Dr. Carras has sufficient experience, including over 40 years' experience in gold mine evaluation, relevant to the style of mineralisation and type of deposits under consideration to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee ("JORC") Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves. Dr. Carras consents to the inclusion in this report of the matters based on this information in the form and context in which it appears. The information in this report that relates to exploration results has been reviewed, compiled and fairly represented by Mr David Jenkins, a Member of the Australian Institute of Geologists and a full time employee of Terra Search Pty Ltd. Mr Jenkins has sufficient experience, including over 29 years' experience in exploration and resource evaluation relevant to the style of mineralisation and type of deposits under consideration to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee ('JORC') Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves. Mr Jenkins consents to the inclusion in this report of the matters based on this information in the form and context in which it appears.

Forward Looking Statements

This announcement contains 'forward-looking information' that is based on the Company's expectations, estimates and projections as of the date on which the statements were made. This forward-looking information includes, among other things, statements with respect to the Company's business strategy, plans, development, objectives, performance, outlook, growth, cash flow, projections, targets and expectations, mineral reserves and resources, results of exploration and related expenses. Generally, this forward-looking information can be identified by the use of forward-looking terminology such as 'outlook', 'anticipate', 'project', 'target', 'potential', 'likely', 'believe', 'estimate', 'expect', 'intend', 'may', 'would', 'could', 'should', 'scheduled', 'will', 'plan', 'forecast', 'evolve' and similar expressions. Persons reading this announcement are cautioned that such statements are only predictions, and that the Company's actual future results or performance may be materially different. Forward-looking information is subject to known and unknown risks, uncertainties and other factors that may cause the Company's actual results, level of activity, performance or achievements to be materially different from those expressed or implied by such forward-looking information.

JORC Code, 2012 Edition: Table 1

Section 1: Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed*	• RC Drilling assays are from 1m samples cone split on the cyclone for the key intercepts. 4m composites from these 1m splits are taken in zones of lower prospectivity at the Laboratory. Where the composite samples return > 0.2g/t Au, they are re-assayed on 1m intervals • Historical drilling has been sampled on a 1m basis. By Battle Mt and Homestake Gold – split at rig. • Duplicates are taken of the second quarter of core every 20 samples to ensure the samples were representative.

Criteria	JORC Code explanation	Commentary
	information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Face Sampling, Reverse Circulation hammer
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• RC drilling was bagged on 1m intervals and an estimate of sample recovery has been made on the size of each sample.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Reverse Circulation holes are being logged on 1m intervals
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise samples representivity* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Duplicates taken every 20 samples by sampling a second quarter of the NQ core, or from a second split directly from cyclone. • Standards submitted every 20 samples of tenor similar to those expected in the sampling. • Cone splitter on the cyclone was used to produce a 1m sub-sample on the RC rig. • Blanks were inserted every 20 samples also • In un-prospective lithologies these 1m samples were composited at the lab over 4m intervals.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• Samples analysed at Intertek Laboratories in Perth, WA, using a 50g Fire Assay method. • Samples are dried, crushed and pulverised prior to analysis.

Criteria	JORC Code explanation	Commentary
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Intercepts have been calculated generally using a 0.5g/t cutoff and internal waste of up to 3m thickness with total intercepts greater than 0.3g/t. All repeats and duplicates have been included. • Historical work has been cross referenced against WAMEX reports A62112 (Battle Mt) and A64818 (Homestake)
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• DGPS has been used to locate the drillholes. • REFLEX Gyro Tool used for downhole surveys on all holes
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.*	• Sample data down hole is at no more than 1m intervals • Data spacing varies from approx. 20m Assessment as to whether sufficient data has been generated to establish the degree of geological and grade continuity appropriate for Mineral Resource and estimation procedure(s) is underway and, if necessary, additional drilling will be carried out to establish continuity.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Intercepts given are downhole widths with the true widths not determined.
Sample security	• *The measures taken to ensure sample security.*	• Samples sealed in bulka bag with Security seal, unbroken when delivered to lab
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• Review of standards, blanks and Duplicates indicate sampling and analysis has been effective for current and historical drilling where QA/QC has been available

Section 2: Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Located in the Marymia - Plutonic Greenstone Belt ~218km northeast of Meekatharra in the Midwest mining district in WA • Exocet M52/231 granted tenement in good standing. Rosella M52/258 tenement in good standing • The tenements predate Native title interests, but are covered by the Gingirana Native Title claim • The tenements are 100% owned by Vango Mining Limited and subsidiary Dampier Plutonic Pty Ltd. • Gold production will be subject to a 1-4% royalty dependent on gold price (Currently 2%) capped at $2M across the entire project area. • Contingent production payments of up to $4M across the entire project area.
Exploration done by other parties.	• *Acknowledgment and appraisal of exploration by other parties.*	• Extensive previous work by Battle Mt and Homestake Gold
Geology	• *Deposit type, geological setting and style of mineralisation.*	
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ▪ *easting and northing of the drill hole collar* ▪ *elevation or RL (Reduced Level - elevation above sea level in metres) of the drill hole collar • dip and azimuth of the hole* ▪ *down hole length and interception depth* ▪ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this*	• Location of new drillholes based on surveyed sites, and DGPS, summarised in Table 2 and shown on Figures 1 and 2. • Location of previous Drillholes based on historical reports and data, originally located on surveyed sites, and DGPS. • Northing and easting data generally within 0.1m accuracy • RL data +-0.2m • Down hole length =+- 0.1 m

Criteria	JORC Code explanation	Commentary
	exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Intercepts have been calculated generally using a 1 g/t cut off or as otherwise stated (see Table 1) and internal waste of up to 3m thickness with total intercepts greater than 1g/t. All Duplicates and repeats are included • No upper cut off has been applied to intersections.

Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.*
	  • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.*
	  • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*
		• Orientation of mineralised zones are still to be ascertained by follow up drilling.

Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Appropriate cross-sectional and plan view of the drilling are included. • See Table 1 &3, summary of drilling intersections and Table 2 & 4, drillhole locations and Table 5, all significant assays, with repeats and duplicates.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• See Table 1 &3, summary of drilling intersections and Table 2 & 4, drillhole locations and Table 5, all significant assays, with repeats and duplicates.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Geological interpretations are included on plan views (Figures 2), sectional view (Figures 3) • No new exploration data has been generated apart from the drilling information included in this report.

Criteria	JORC Code explanation	Commentary
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Extensive further drilling is planned for the project
