
ASX ANNOUNCEMENT

29 NOVEMBER 2021

Amended Announcement

Sunstone Metals Ltd (ASX: STM) is hereby lodging an amended version of the ASX announcement dated 25 November 2021, with the references to gold equivalents removed at the request of ASX to satisfy the requirements of the JORC Code, Clause 50, which states *“Reporting on the basis of metal equivalents is not appropriate if metallurgical recovery information is not available or able to be estimated with reasonable confidence.”*

El Palmar gold-copper discovery, northern Ecuador

Third hole delivers more outstanding wide intersections of gold and copper mineralisation

Mineralisation now intersected over 300m long zone and from surface

Key Points

- Assays from hole EPDD003 include:
 - 105.09m at 0.75g/t gold and 0.20% copper from 32m
 - Within 259.56m at 0.41g/t gold and 0.14% copper from 10.4m
- Assays now show significant grades and widths of gold and copper porphyry mineralisation in five holes (EPDD001-EPDD003, and historic holes CED01 and 02) across a 300m long zone, which remains open, on the south side of the El Palmar magnetic complex
- Drill holes EPDD004, 005, and 006 have been completed (assays pending), and hole EPDD007 is underway. All holes are mineralised from shallow depths
- The latest assays provide more firm evidence that El Palmar is a substantial gold-copper porphyry discovery
- Results support Sunstone's view that only the upper portion of a porphyry system has been drilled so far, and this likely extends to considerable depth, and a second drill rig is mobilising to site to test the depth extent
- The scale of the opportunity at El Palmar is increasing with soil sampling completed, and results pending, over two satellite targets within a 1km radius of the discovery holes
- At the high-grade Alba gold target on the Bramaderos Project in southern Ecuador, drilling of the second hole is set to start this weekend
- Sunstone is well funded with ~A\$19mill in cash and equities to implement this exciting exploration program across 2 projects

Sunstone Metals Ltd (ASX: STM) is pleased to announce more outstanding assays which confirm that the El Palmar deposit in northern Ecuador (Figure 4) is a significant gold-copper porphyry discovery.

Sunstone is acquiring a 100% interest in the El Palmar Project and currently holds 51% under the Staged Acquisition Agreement signed on 12 August 2020 (see ASX announcement dated 12 August 2020).

This announcement is an amended version of the ASX announcement dated 25 November 2021, with the references to gold equivalents removed at the request of ASX to satisfy the requirements of the JORC Code, Clause 50.

ASX ANNOUNCEMENT

The project is located in northern Ecuador in the vicinity of the 1.0Bt Llurimagua copper-molybdenum porphyry deposit, and in the same regional structural belt that hosts the 2.6Bt Alpala copper-gold deposit within the Cascabel project (Figures 1 & 2).

The El Palmar results reported in this release comprise all assays from drill hole EPDD003 and the previously unreported assays from portions of EPDD002.

Drill holes EPDD004, 5 and 6 have now been completed (assays pending), and hole EPDD007 is in progress (Table 2). All holes are mineralised from shallow depths.

Drill Hole	From (m)	To (m)	Interval (m)	Au (g/t)	Cu (%)	Mo (ppm)	Ag (g/t)

Table 1: Mineralised intervals in holes EPDD001 (previously reported), EPDD002, and EPDD003

Sunstone MD Malcolm Norris said it was clear the Company had made a major discovery at El Palmar.

“These results are very good and continue to support our view that El Palmar is a substantial discovery,” Mr Norris said. “This is a big system and has huge potential. It is early days, but importantly every hole has been mineralised.

“We are increasing our understanding of the geology and the controls on mineralisation, and we are continuing to deliver good grades and widths with mineralisation that starts from surface.

“We are now drilling hole seven. In early December, we plan to have a second drilling rig on the project that will drill the deep magnetic targets.

“We are seeing some evidence that the first seven holes are defining the upper parts of a large porphyry system with multiple mineralising intrusions emplaced into wallrocks. Given this, we are increasingly excited about the deep targets and the potential for the mineralisation to have a vertical extent of more than 1km.”

ASX ANNOUNCEMENT

Mr Norris said surface soil sampling results from two of the highest-priority satellite porphyry targets were expected before the end of this year. These results could further grow the potential of the project.

Sunstone is also preparing to drill the high-grade Alba gold target at Bramaderos in southern Ecuador, with a five-hole, 2,000m program starting this weekend.

El Palmar Technical Discussion

Geological logging of holes EPDD001 to 006 has identified an extensive porphyry system with multiple phases of intrusive rocks, and local areas of epithermal overprint. At least three porphyry mineralising episodes hosted by high-level dioritic intrusives have been identified, with mineralisation extending into the wallrock intrusions (Figures 1 & 2).

Assays now show significant grades and widths of gold and copper porphyry mineralisation in five holes (EPDD001-EPDD003, and historic holes CED01 and 02) across a 300m long zone, which remains open, on the south side of the El Palmar magnetic complex. This is a substantial area of consistent mineralisation in the southern portion of the broader magnetic anomaly (Figures 1 & 2). Drill holes EPDD004 and 005 have partially tested the northern portion of the anomaly. With each drill hole the mineralisation area is being expanded.

The degree of veining is variable and includes multiple phases of quartz and quartz-sulphide veins, and multiple phases of copper-sulphide bearing magnetite veins. Chalcopyrite continues to be the dominant copper sulphide, with some associated bornite, and minor hypogene covellite and chalcocite.

The El Palmar auger soil sampling program has resumed and is covering several additional targets to the southeast, northeast, and northwest of the main El Palmar target to bring these to the drill testing stage (Figure 1). Some infill sampling has also been undertaken over the main target area. The 2 closest satellite targets, to the immediate southeast and northeast have been soil sampled and results are expected in December. The southeast area has had some historical rock chip sampling and 25 samples over a strike length of 60m, on the margin of a coincident bullseye magnetic anomaly, returned an average of 0.33g/t gold and 0.12% copper.

Sunstone's cash and equity investments remain strong at ~\$19m, allowing expanded exploration activities at both El Palmar and Bramaderos.

ASX ANNOUNCEMENT

Figure 1: RTP magnetics image showing the circular magnetic anomaly being targeted with drilling by Sunstone. Holes EPDD001, EPDD002, EPDD003, EPDD004, EPDD005 and EPDD006 have been completed, and hole EPDD007 is in progress. Prepared drill collars to allow for future drilling are shown as black dots. Also shown are three historical drill holes (CED01-03, drilled by Codeco), which drilled away from the Sunstone defined target area (see ASX announcement dated 12th August 2020 for details of historical drilling results).

ASX ANNOUNCEMENT

ASX ANNOUNCEMENT

About Sunstone Metals

Sunstone has an advanced portfolio of exploration and development projects in Ecuador and Scandinavia. The portfolio comprises:

1. **The Bramaderos Gold-Copper Project** where Sunstone owns an 87.5% interest with TSXV listed Cornerstone Capital Resources holding 12.5% (see ASX announcement dated 10th April 2017, 28th August 2019, and 7 January 2020). The Bramaderos gold-copper project is located in Loja province, southern Ecuador, and is highly prospective for the discovery of large porphyry gold-copper systems, and high-grade epithermal gold systems. Historical exploration results from drilling at Bramaderos together with recent exploration by Sunstone and joint venture partner Cornerstone Capital Resources (TSXV:CGP) indicate multiple fertile mineralised systems with significant discovery potential.
2. **The El Palmar Copper-Gold Project** where Sunstone holds 51% of the highly prospective 800ha El Palmar gold-copper porphyry project in Ecuador and can acquire 100% through a Staged Acquisition Agreement. The El Palmar gold-copper project is located in Imbabura province, northern Ecuador, within the same geological belt that includes the giant Alpala and Lurimagua porphyry copper-gold and copper-molybdenum deposits.
3. **Sunstone has a large equity interest** in Stockholm listed Copperstone Resources (COPP-B.ST) following the sale of the Viscaria Copper project to Copperstone in 2019.
4. **The Finland Lithium Project** includes the Kietymäki lithium prospect. Drilling by Sunstone has delivered 24.2m at 1.4% Li₂O in a spodumene-bearing pegmatite. The project is a JV with Nortec Minerals. As announced on 5 May 2021, a Letter of Intent has been signed to sell the Finland Lithium Project.

Competent Persons Statement

The information in this report that relates to exploration results is based upon information reviewed by Dr Bruce Rohrlach who is a Member of the Australasian Institute of Mining and Metallurgy. Dr Rohrlach is a full-time employee of Sunstone Metals Ltd and has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Dr Rohrlach consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Mr Malcolm Norris, Managing Director of Sunstone Metals Ltd., has authorised this announcement to be lodged with the ASX.

ASX ANNOUNCEMENT

TABLE 1 – Section 1: Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. 	<ul style="list-style-type: none"> The historical results announced here are from rock chip samples and drill core from El Palmar. The drill core sampling was carried out using half core, generally at 1.5 to 2m intervals. New results are based on visual observation of drill core.
	<ul style="list-style-type: none"> Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. 	<ul style="list-style-type: none"> Historical rock samples were taken randomly with focus on those exhibiting alteration and mineralisation. Trench samples from within a hand dug trench and hand cut channel samples were continuously sampled for representivity. Core recovery was good, and core aligned prior to splitting.
	<ul style="list-style-type: none"> Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> Diamond drilling, rock chip and channel sampling points have been guided by geological mapping. The rock chip and drill samples from El Palmar were dried, crushed to 70% passing 2mm, Split 1000g and pulverised to 85% passing 75microns. A 20g portion of this sample was used for multi-element analysis (IMS-230) and a 30g sample for Fire Assay Au (FAS-111).
Drilling techniques	<ul style="list-style-type: none"> Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<ul style="list-style-type: none"> The El Palmar target areas were drilled by historical exploration.
Drill sample recovery	<ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. 	<ul style="list-style-type: none"> Diamond core recovery data for the El Palmar historical drilling was good from visual review of drill core.
	<ul style="list-style-type: none"> Measures taken to maximise sample recovery and ensure representative nature of the samples. 	<ul style="list-style-type: none"> Historical core recovery at El Palmar was good.
	<ul style="list-style-type: none"> Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> No relationship between sample recovery and grade has been established.
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. 	<ul style="list-style-type: none"> Drill samples, trench samples and rock chips were logged for lithology, weathering, structure, mineralogy, mineralisation, colour, and other features. Recent logging and sampling for the El Palmar project were carried out according to Sunstone's internal protocols and QAQC procedures which comply with industry standards.
	<ul style="list-style-type: none"> Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography. 	<ul style="list-style-type: none"> Drill samples are logged for lithology, weathering, structure, mineralogy, mineralisation, colour, and other features.
	<ul style="list-style-type: none"> The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> The historical drill holes have been re-logged in full.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. 	<ul style="list-style-type: none"> Half core was used to provide the samples that were submitted for assay from the upper zones of the El Palmar historical drilling.
	<ul style="list-style-type: none"> If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry. 	<ul style="list-style-type: none"> Standard rock chip samples and channel samples. Samples were dried in the laboratory.

ASX ANNOUNCEMENT

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> Historical drill core samples from El Palmar (drilled by Codelco) were analysed by ACME Labs in Vancouver. Samples were crushed and split with 250 grams pulverized to 200 mesh (Method - R200-250). Analysis on drill core was undertaken on a sample split (Method - VAN split pulp). Surface rocks at El Palmar are historical and were collected by 3 different companies. GOEX S.A. samples were analysed at Bureau Veritas Laboratories in Peru. Lowell Mineral Exploration rocks were analysed by ALS Minerals, with sample preparation involving fine crushing 70% passing 2mm (Method CRU-31), crushed sample split (Method SPL-21) and pulverise 1000g to 85% passing 75um (Method PUL-32). Codelco surface rock samples were analysed by ACME Labs in Vancouver. Samples were crushed and split with 250 grams pulverized to 200 mesh (Method - R200-250) The sample preparation is carried out according to industry standard practices using highly appropriate sample preparation techniques. Sunstone used an industry standard QAQC programme involving Certified Reference Materials "standards" and blank samples, which were introduced in the assay batches. Standards (Certified Reference Materials) or analytical blanks were submitted at a rate of 1 in 28 samples. Field duplicates were also taken at a rate of approximately 1 in 28 samples. The check or duplicate assay results are reported along with the sample assay values in the final analysis report. For diamond core, the routine sample procedure is to always take the half/quarter core to the right of the orientation line (looking down hole) or the cut line (in cases where the orientation line was not reliable). Once assay results are received the results from duplicate samples are compared with the corresponding routine sample to ascertain whether the sampling is representative. Sample sizes are considered to be appropriate for the style of sampling undertaken and the grain size of the material, and correctly represent the style and type of mineralisation at the exploration stage.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, 	<ul style="list-style-type: none"> Sunstone uses a fire assay gold technique for Au assays (FAS-111) and a four acid multi element technique (IMS-230) for a suite of 48 elements. FAS-111 involves Au by Fire Assay on a 30-gram aliquot, fusion and atomic absorption spectroscopy (AAS) at trace levels. IMS-20 is considered a near total 4 acid technique using a 20g aliquot followed by multi-element analysis by ICP-AES/MS at ultra-trace levels. This analysis technique is considered suitable for this style of mineralisation. A handheld "Niton" XRF instrument is used on site for verification of anomalous metal values and to assist with the geological logging and mineral identification. No specific data from this instrument

Geology	<ul style="list-style-type: none"> • <i>Deposit type, geological setting and style of mineralisation.</i> 	<ul style="list-style-type: none"> • The deposit style being explored for includes intrusion-related and stockwork hosted porphyry Au-Cu systems plus epithermal gold-silver-polymetallic veins. The setting at El Palmar is a volcanic arc setting of Miocene age intrusions.
Drill hole Information	<ul style="list-style-type: none"> • <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ol style="list-style-type: none"> <i>easting and northing of the drill hole collar</i> <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>dip and azimuth of the hole</i> <i>down hole length and interception depth</i> <i>hole length.</i> 	<ul style="list-style-type: none"> • Details of the samples discussed in this announcement are in the body of the text. • See Figures 1 & 2 for the location of historical drilling at El Palmar.
	<ul style="list-style-type: none"> • <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i> 	<ul style="list-style-type: none"> • Information included in announcement.
Data aggregation methods	<ul style="list-style-type: none"> • <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i> 	<ul style="list-style-type: none"> • Weighted averages were calculated over reported intervals according to sample length. • No grade cut-offs were applied.
	<ul style="list-style-type: none"> • <i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> 	<ul style="list-style-type: none"> • No aggregating of intervals undertaken at this stage.
	<ul style="list-style-type: none"> • <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> 	<ul style="list-style-type: none"> • Metal equivalents are not presented.
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> • <i>If the geometry of the mineralisation with respect to the drill-hole angle is known, its nature should be reported.</i> 	<ul style="list-style-type: none"> • The geometry of the mineralisation relative to the drill holes is not completely known at this stage of exploration. .
	<ul style="list-style-type: none"> • <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i> 	<ul style="list-style-type: none"> • True widths of mineralised lodes are not known at this stage.
Diagrams	<ul style="list-style-type: none"> • <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> 	<ul style="list-style-type: none"> • See Figures 1 & 2 for maps showing distribution of samples.
Balanced reporting	<ul style="list-style-type: none"> • <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i> 	<ul style="list-style-type: none"> • Figures 1 & 2 above shows the current interpretations of geology.
Other substantive exploration data	<ul style="list-style-type: none"> • <i>Other exploration data, if meaningful and material, should be reported) including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> 	<ul style="list-style-type: none"> • Figure 1 & 2 above shows various datasets that are being used to identify target areas and to guide current and future drilling.

ASX ANNOUNCEMENT

Criteria	JORC Code explanation	Commentary
Further work	<ul style="list-style-type: none"> <i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> 	<ul style="list-style-type: none"> The planned exploration program is outlined in the announcement.
	<ul style="list-style-type: none"> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	<ul style="list-style-type: none"> See Figures 1 & 2 which show areas for further exploration.
