GRAPHITE MINERALISATION CONTINUES TO EXPAND IN LACROMA CENTRAL RESOURCE

ASX RELEASE

19 October 2023

SUMMARY

0

 \cap

• Significant graphite results from the latest drill assays at Central Lacroma include:

DRILLING

- LARC23-093 20m @ 7.9% TGC from 58m
 - incl 11m @ 9.0% TGC from 63m
- LARC23-100 18m @ 7.1% TGC from 99m
 - incl 5m @ 8.6% TGC from 71m
- LARC23-097 21m @ 6.6% TGC from 22m
 incl 6m @ 12.0% TGC from 36m
 - LARC23-091 9m @ 7.0% TGC from 109m
 - incl 4m @ 9.6% TGC from 109m
- LARC23-085 5m @ 5.8% TGC from 55m
 - incl 2m @ 8.5% TGC from 56m
 - and 2m @ 12.5% TGC from 65m
- LARC23-083 9m @ 6.9% TGC from 89m
 - LARC23-076 18m @ 5.8% TGC from 47m

incl 4m @ 8.4% TGC from 50m

and 4m @ 5.2% TGC from 86m

- Drill holes extend mineralisation 500m north of the first positive drill results at Lacroma (ASX Release "Impressive Graphite Intervals in First Lacroma Drilling" on 29 May 2023).
- Mineralisation appears to be offset to the east from the main airborne electromagnetic (EM) anomaly in the northern traverses, resulting in thinner mineralised intervals being intersected in the current traverses.
- iTech plans to extend the traverses to the east where the mineralisation is predicted to increase in thickness and grade.
- Mineralisation also appears to increase in grade and thickness to the south which will be the focus of drilling for the remainder of the year.
- Approximately 61 resource drill holes have been completed to date.
- Drilling is continuing at 100m spaced east-west sections to the south once infill and extension drilling is completed.

"The latest results from the Lacroma Graphite Prospect have demonstrated that strong graphite mineralisation continues 500m north of the first traverse drilled at Lacroma Central. The drilling program continues to deliver significant results with over 60 holes of the resource drilling program completed to date."

Managing Director - Mike Schwarz

www.itechminerals.com.au

Figure 1. Location of iTech's Graphite Deposits and Prospects – Eyre Peninsula, South Australia

Lacroma Graphite Prospect

The Lacroma Graphite Prospect is located approximately 20km south-west of Kimba on the central Eyre Peninsula and <20km from iTech's proposed graphite processing plant for the Campoona Spherical Graphite Project. The graphite at this location occurs within the Paleoproterozoic Hutchison Group Metasediments and is likely to have formed from organic rich stratigraphic horizons metamorphosed during regional upper greenschist to lower amphibolite facies metamorphism during the Kimban Orogeny. The Lacroma Central graphite rich horizon forms a north-south trending structure with a shallow easterly dip.

Drill Results

Assay results have been received for all holes drilled 25m apart along the east-west traverses at 6,316,900mN, 6,317,000mN and 6,317,100mN at Lacroma Central. These traverses are located between 300m and 500m north of where mineralisation was first drilled at Lacroma as announced on 29 May 2023.

iTech located these drillholes based on the main trend of the airborne electromagnetic anomaly and has interpreted that the thickest mineralisation is located just to the west of the electromagnetic high (peak) (Figure 2). While the assays from these traverses demonstrate that mineralisation extends north over 500m and remains open, it appears that the three traverses have hit the thinner western zone of graphite mineralisation and that, projecting from the southern traverses, mineralisation should increase in grade and thickness to the east. At this location the mineralisation appears to be thickening to the east directly under the main electromagnetic high. Extensional drilling is underway to test this theory.

Lacroma West Drilling Update

Over the past month, the Company has attempted to drill test the Lacroma West electromagnetic anomaly to test for graphite mineralisation. Initial aircore drilling was unsuccessful due to resistant silcrete layers. A larger RC rig was then brought in from the main resource drilling at Lacroma Central which was moderately more successful. Drilling identified that there is between 30-60m of silcreted sediments and transported river gravels and sediments over the top of the anomaly to 100-130m deep but was not able to identify a source for the anomaly. The host rock is generally a chlorite schist, which can also be the host for graphite mineralisation, but no graphite was logged or visually identified. The holes have been submitted for laboratory analysis.

Given that only three holes sufficiently penetrated the location of where the source of the anomaly should be drilling could have missed the main graphite horizon. With the increasing time and costs associated with the drilling operations, the decision was made to refocus efforts on Lacroma Central, a target with lower associated risks, to meet our resource tonnage requirements. iTech proposes three potential explanations for the western electromagnetic anomaly:

- 1. Salty ground water in the overlying river gravels.
- 2. Manganese mineralisation which was tentatively logged in one hole; or
- 3. Graphite mineralisation that was missed in the drilling.

Option 3 remains the most probable choice because the calculated extent of the anomaly goes well beyond the shallow groundwater level, and the manganese logged is unlikely to generate such a robust electromagnetic anomaly. Due to the challenging drilling conditions and problematic overlying materials, any additional drilling will be postponed until after the resource drilling is finished at Lacroma Central.

Next Steps

Over 60 drill holes have been completed in the northern part of the Lacroma Central resource drilling area with a total of 5 east-west traverses extending over 500m, from north to south, completed at ~100m intervals. Several infill holes will be completed in this area, after which the drill rig will move south to test the southern extension of mineralisation between 6,316,600mN and 6,315,600mN. Drilling is expected to continue for the next 2-3 months to test the full potential of the resource area.

ABOUT ITECH MINERALS LTD

iTech Minerals Ltd (**ASX:ITM**, **iTech** or **Company**) is an ASX listed mineral exploration company exploring for and developing battery materials and critical minerals within its 100% owned Australian projects. The Company is exploring for graphite, kaolinite-halloysite, regolith hosted clay rare earth element mineralisation and developing the Campoona Graphite Deposit in South Australia. The Company also has extensive exploration tenure prospective for Cu-Au porphyry mineralisation, IOCG mineralisation and gold mineralisation in South Australia and tin, Tungsten, and polymetallic Cobar style mineralisation in New South Wales.

GLOSSARY

AEM = Airborne Electromagnetic EM = Electromagnetic TGC = Total Graphitic Carbon

COMPETENT PERSON STATEMENT

The information which relates to exploration results is based on and fairly represents information and supporting documentation compiled by Michael Schwarz. Mr Schwarz has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking, to qualify as a Competent Person as defined in the 2012 edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (the JORC Code). Mr Schwarz is a full-time employee of iTech Minerals Ltd and is a member of the Australian Institute of Geoscientists and the Australian Institute of Mining and Metallurgy. Mr Schwarz consents to the inclusion of the information in this report in the form and context in which it appears.

This announcement contains results that have previously released as "Impressive Graphite Intervals in First Lacroma Drilling" on 29 May 2023, "High Grade Core Identified in New Lacroma Drill Results" on 5 June 2023" and "Graphite mineralisation expands in Lacroma Central resource drilling" on 21 September 2023. iTech confirms that the Company is not aware of any new information or data that materially affects the information included in the announcement.

JORC 2012 EDITION - TABLE 1 Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code Explanation	Commentary
Sampling Techniques	 Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	 All samples were collected through a cyclone and splitter into plastic bags and pre-numbered calico bags at 1 m intervals, which have been sent for chemical analyses. Composite intervals were created for intervals where no visual graphite was observed. Composite samples are typically comprised of 4 single metre intervals and weigh roughly 1-2 kg for initial test work. All samples were sent to the Intertek laboratory in Adelaide for preparation and forwarded to Perth for analyses. All samples are crushed using LM2 mill to -4 mm and pulverised to nominal 85% passing -75 µm. Analyses were performed on a sub sample of this pulverised sample.
Drilling Techniques	 Drill type (e.g., core, reverse circulation, open hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.). 	 Lehmann Drilling used a Reverse Circulation drill rig mounted on an 8- wheel truck with support equipment. Reverse Circulation (RC) drilling uses an 140mm face sampling hammer bit and is a form of drilling where the sample is collected at the face and returned inside the inner tube. The drill cuttings are removed by the injection of compressed air into the hole via the annular area between the inner tube and the drill rod. The Competent Person has inspected the drilling program and considers that drilling techniques was commensurate with industry standards current at the time of drilling and is appropriate for the indication of the presence of mineralisation.
Drill Sample Recovery	• Method of recording and assessing core and chip sample recoveries and results assessed.	 No assessment of recoveries was documented All efforts were made to ensure the sample was representative

Criteria	JORC Code Explanation	Commentary
	 Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	No relationship is believed to exist, but no work has been done to confirm this.
Logging	 Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography. The total length and percentage of the relevant intersections logged. 	 All samples were geologically logged to include details such as colour, grain size, structure, lithology, alteration, mineralogy and graphite content. Collars were located using a handheld GPS, a licenced surveyor will locate all holes with DGPS. The holes were logged in both a qualitative and quantitative fashion relative to clay content. All drill holes are logged.
Sub- Sampling Techniques and Sample Preparation	 If core, whether cut or sawn and whether quarter, half or all cores taken. If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry. For all sample types, the nature, quality, and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	 All RC samples are split using a 3 tier riffle splitter mounted under the cyclone, RC samples are drilled dry, less than 10% of the sample were returned to the surface wet. A full profile of the bag contents was subsampled to ensure representivity via the splitter. Composite intervals were created for intervals where graphite was not visually observed. As such the composite intervals created are typically about 4m in length. Composite samples weigh roughly 1-2 kg for initial test work. Sample size is deemed appropriate to be representative of the grainsize. All samples were sent to Intertek laboratory in Adelaide for preparation and forwarded to Perth for graphite and multi-element analyses. QAQC (duplicates, blanks and standards) are submitted at a frequency of 10%. All samples are crushed using LM2 mill to -4 mm and pulverised to nominal 85% passing -75 µm.
Quality of Assay Data and Laboratory Tests	 The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc., the 	 Certified standards were used in the assessment of the analyses. Analyses will be by Intertek Perth using their 4A/MS48 technique for multi-elements and C72/CSA for graphite. NOTE: Four acid digestions are able to dissolve most minerals; however,

Criteria	JORC Code Explanation	Commentary
	 parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. 	 although the term "near-total" is used, depending on the sample matrix, not all elements are quantitatively extracted. Detection Limit for TGC is 0.01% The laboratory uses their own certified standards during analyses. QAQC (duplicates, blanks and standards) are submitted at a frequency of 10%.
Verification of Sampling and Assaying	 The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	 No verification of sampling, no use of twinned holes Data is exploratory in nature and is compiled into excel spreadsheets. No adjustments have been made to any assay data.
Location of Data Points	 Accuracy and quality of surveys used to locate drillholes (collar and downhole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	 The location of drill hole collar was undertaken using a hand-held GPS which has an accuracy of +/- 5m using UTM MGA94 Zone 53. The quality and adequacy is appropriate for this level of exploration. No downhole surveys have been undertaken. Drill collars are being surveyed, in batches, using DGPS after being completed
Data Spacing and Distribution	 Data spacing for reporting of Exploration Results. Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	 East-west traverses are being drilled with holes at 25m centres and spaced at 1km intervals. Traverses are then infilled to 400m and then 200m intervals with adjustments made for access for the drill rig, geological parameters, vegetation and land surface. The primary purpose of the drilling is to define the extent of graphite mineralisation defined by a 6 km NNW-SSE airborne electromagnetic anomaly. Data spacing and distribution are sufficient to establish a degree of geological and grade continuity for future drill planning, but not for resource reporting. As drilling progresses and traverse spacings are decreased the spacing and distribution will become suitable for resource reporting.

мі	 C R A	 (
ASX: ITM			

Criteria	JORC Code Explanation	Commentary
		 Compositing of intervals without visual graphite mineralisation has occurred for the purpose of assaying.
Orientation of Data in Relation to Geological Structure	 Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	 Drill holes appear to have intersected the mineralised layer at 45 degrees. Additional drilling on a regular patter in required to better understand the sub- surface geology and structure. It is unknown if any bias has been introduced a sampling bias.
Sample Security	The measures taken to ensure sample security.	 All samples have been in the custody of iTech employees or their contractors and stored on private property with no access from the public. All residual sample material and pulps are stored securely
Audits or Reviews	The results of any audits or reviews of sampling techniques and data.	None undertaken.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code Explanation	Commentary
Mineral Tenement	Type, reference name/number,	Tenement status confirmed on
Mineral Tenement and Land Tenure Status	 Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	 SARIG. The tenements are in good standing with no known impediments. The drill target is on EL6634 owned by ChemX Materials (ASX: CMX) and is subject to an agreement in which iTech owns 100% of the graphite rights through its wholly owned subsidiary Pirie Resources Pty
Exploration Done by Other Parties	Acknowledgment and appraisal of exploration by other parties.	 Ltd. Relevant previous exploration has been undertaken by Monax Mining Ltd, Marmota Energy Ltd, and Archer Materials Ltd An airborne Electromagnetic Survey was commissioned by Monax Mining Ltd/Marmota Energy Ltd in 2012 and was flown by Fugro using their airborne TEMPEST System.
Geology	 Deposit type, geological setting and style of mineralisation. 	 The tenements are within the Gawler Craton, South Australia. iTech is exploring for graphite, porphyry Cu-Au, epithermal Au, kaolin and halloysite and REE deposits. The graphite at this location occurs within the Paleoproterozoic Hutchison Group Metasediments and is likely to have formed from organic rich stratigraphic horizons metamorphosed during regional upper greenschist to lower amphibolite facies metamorphism during the Kimban Orogeny. The graphite rich horizon forms a largely flat lying, shallow anticlinal structure as interpreted from drilling and detailed airborne and ground-based electromagnetics
Drillhole Information	 A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: Easting and northing of the drill hole collar 	See Appendix 1 for drill hole information.

19 October 2023

ITECH MINERALS 7

Criteria	JORC Code Explanation	Commentary
	 Elevation or RL (Reduced Level elevation above sea level in metres) of the drill hole collar Dip and azimuth of the hole Downhole length and interception depth Hole length If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	
Data Aggregation Methods	 In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	 No high-grade cuts were necessary. Aggregating was made for intervals that reported over 3% TGC (Total Graphitic Carbon) using a downhole interval weighted arithmetic average. Internal dilution was less than 3m @ 1% TGC High-grade intervals were calculated has a cut-off grade of 7% TGC with internal dilution of nor more than 3m @ 5% TGC. No equivalents were used.
Relationship Between Mineralisation Widths and Intercept Lengths	 These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the downhole lengths are reported, there should be a clear statement to this effect (e.g., 'downhole length, true width not known'). 	 All drill intervals are down hole length, the true width is estimated to be 85% of down hole length. All intercepts reported are down hole lengths.
Diagrams Balanced Reporting	 Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. Where comprehensive reporting of 	 See main body of report. All other relevant data has been
Dalanceu Reporting	Where comprehensive reporting of	

MI

Criteria	JORC Code Explanation	Commentary
	all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced avoiding misleading reporting of Exploration Results.	reported.The reporting is considered to be balanced.Where data has been excluded, it is not considered material.
Other Substantive Exploration Data	 Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	 The Project area has only been subjected to minimal exploration with only 4 holes drilled by Monax Mining Ltd in 2012 All relevant exploration data has been included in this report. Metallurgical test work was undertaken by Archer Materials (ASX: AXE) in 2015 on a 50 kg sample from drill hole WG021. This consisted of grind and flotation test work to produce a concentrate. The concentrate had a grade of >90% TGC with recoveries exceeding 83%.
Further Work	 The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	 Further exploration, sampling, geochemistry, geophysics and drilling required to establish a JORC complaint resource.
