Drilling Continues to Deliver High Value Intercepts at the Maronan Project.

Maronan Metals is very pleased to report more strong assays from the 2024 drilling campaign completed in December. Results continue to reinforce the strong continuity of wide zones of high value silver with lead mineralisation along the Eastern and Western Horizons and scope for untested extensions. Continuous lodes of copper and gold mineralisation are emerging within the shallow Starter Zone that may also be early mining options.

Maronan Metals Managing Director Richard Carlton commented:

"The whole 2024 program has successfully confirmed the continuity of wide zones of strong silver with lead mineralisation building on the maiden Indicated Resource declared a year ago.

We now look forward to receiving the last of the assay results and updating the resource model over the coming months which should facilitate the publication of preliminary mining studies on the Starter Zone. The momentum towards being 'mine ready' continues to build."

Maronan Metals Ltd (ASX: MMA) (Maronan or the Company) is an Australian mineral explorer focused on realising the growth potential of the advanced Maronan Silver-Lead and Copper-Gold deposit in the Cloncurry region of Northwest Queensland. Ongoing Work Program

Results for the remaining holes from the 2024 drill program are anticipated over the next 4 -6 weeks.

An updated mineral resource using results from the successful 2024 drill campaign is underway.

Baseline environmental monitoring, in particular surface water sampling, is a priority during the wet season. In addition, Maronan is establishing a weather station and conducting baseline noise monitoring studies as part of ongoing permitting related works.

The company continues to progress meetings with various stakeholders related to the Mine Development License application.

Preliminary plans for the 2025 drilling season are being developed.

Maronan Metals Limited (ASX:MMA) is an Australian mineral explorer focused on realising the growth potential of the advanced Maronan copper-gold and silver-lead deposit in the Cloncurry region of northwest Queensland - one of Australia's most productive mineral provinces.

As at 2024, the Maronan project contains JORC 2012 compliant Inferred and Indicated Resources of:

- 32.1 Mt @ 6.1% lead with 107 g/t silver (using >3% lead cut-off grade) including,
  - 2.1 Mt @ 5.3% lead with 155 g/t silver (using >3% lead cut-off grade) Indicated Resource,
- 32.5 Mt @ 0.84% copper with 0.61 g/t gold and 7 g/t silver (using >0.4% copper cut-off grade),
- 1.8 Mt @ 1.24 g/t gold (using >1.0 g/t gold cut-off grade).

ASX:MMA 12 March 2024, "Updated Resource Estimate Fuels Ideas of Early Development Potential of the Shallow Starter Zone". Refer to Appendix 4 for Resource Tables.

Work to date has reinforced our understanding of the deposit's geometry and significant size potential while metal and grade variations allow considerable flexibility and optionality in how the resources can be appraised.

COMPETENT PERSONS STATEMENT

The information in this report that relates to Exploration Results is based on and fairly represents information and supporting documentation compiled by Mr Andrew Barker, who is a member (#6299) of the Australian Institute of Geoscientists (AIG). Mr Barker is the Exploration Manager of the Company. Mr Barker has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (the JORC Code). Mr Barker consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The Mineral Resource Estimate in this announcement for the Maronan project was initially reported in the Company's ASX release dated 12 March 2024, titled "Updated Resource Estimate Fuels Ideas of Early Development Potential of the Shallow Starter Zone". Maronan Metals confirms that no new information or data materially affects the information included in the original announcement. For the estimates of Mineral Resources, all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Persons' findings are presented have not been materially modified from the original market announcements.

Silver Equivalent Calculation

Silver Equivalent was calculated using the formula: AgEq = ((Ag (ppm) * Agrec *Agprice) + (Pb (%) * Pbrec *Pbprice))/ Agprice

- Ag (ppm) is the assay grade in parts per million of silver
- Ag price is the value of 1g/t silver based on a price assumption of $USD25/ounce). In this instance the value of $0.804
- Ag rec is the estimated silver recovery from metallurgical test work at Maronan of 91% reported to ASX on 18/2/2025
- Pb (%) is the weight percent assay grade for Lead
- Pb price is the value of 1% Lead based on a price assumption of $USD2000/tonne). In this instance the value of $20
- Pb rec is the estimated silver recovery from metallurgical test work at Maronan of 95% reported to ASX on 18/2/2025
- The formula calculates the value of metal for Silver and Lead and divides by the value of 1g/t silver to calculate the silver Equivalent value
- This Silver Equivalent calculation does not take into account any assumptions about payability, treatment costs or refining cost. Copper, gold and zinc are not included in the Silver Equivalent calculation.
- Zinc is not included in the Silver Equivalent calculation as no metallurgical test work for zinc has been completed at Maronan to date.
- It is Maronan Metal's opinion that the elements included in the Metal equivalents calculation have a reasonable potential to be recovered and sold.

APPENDIX 1. JORC CODE, 2012 EDITION – TABLE 1 REPORT TEMPLATE

1.1 Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representativity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.*	• Most samples for this report were half-core sampling of diamond drill core. Samples for selected intervals of some drill holes have been taken as quarter core samples to preserve half core samples for metallurgical test work. A record of the sample type (half or quarter core) is included in Appendix 3 where full assay results for Au, Ag, Cu, Pb and Zn are shared • Core has been cut longitudinally using an automatic corewise core saw. • Samples have been submitted for assay analysis with ALS Global. • Samples for holes MRN24004, MRN24007 & MRN24010W1 were prepared at the Mt Isa Laboratory. • Samples for holes MRN24008, MRN24009, MRN24010, MRN24011, MRN24012, MRN24013, MRN24013W1 and MRN24014 were prepared at the Townsville Laboratory • Samples are crushed and pulverized to 85% passing 75um. Samples are then assayed using the Au-AA25 (30g fire assay) completed at ALS Townsville and ME-MS61 assay methods (48 element ICP-MS suite) completed at ALS Brisbane. For samples that return over-limit assays from the ME-MS61 assays, samples are re-assayed using the OG62 method. • Maronan Metals has included certified reference materials and blank samples to monitor laboratory performance at a rate of approximately 1:25 samples. In addition to this, ALS has also included addition reference materials and blank materials to monitor the performance of the laboratory.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• All drilling for the 2024 drill program at Maronan was Diamond Drilling • MRN24004 – Diamond Drilling. PQ3: 0 – 70.7m; HQ3: 68.7 – 255.5m. • MRN24007 - Diamond Drilling. PQ3: 0 – 45.5m; HQ3: 45.5 –376.8m. • MRN24008 - Diamond Drilling. PQ3: 0 – 44.6m; HQ3: 44.6 –231.7m. • MRN24009 - Diamond Drilling. PQ3: 0 – 50.5m; HQ3: 45.5 –312.6m. • MRN24010 - Diamond Drilling. PQ3: 0 – 50.8m; HQ3: 50.8 –200.6m;

Criteria	JORC Code explanation	Commentary
		NQ2: 200.6 – 420.9m • MRN24010W1 - Diamond Drilling. NQ2: 89.3 – 627.7m. • MRN23022W1 - Diamond Drilling. NQ2: 121.8 – 459.6m. • MRN24011 - Diamond Drilling. PQ3: 0 – 57.2m; HQ3: 57.2 –125.6m; NQ2: 125.6 – 467.8m • MRN24012 - Diamond Drilling. PQ3: 0 – 44.7m; HQ3: 44.7 –110.5m; NQ2: 110.5 – 331.5m • MRN24013 - Diamond Drilling. PQ3: 0 – 47.6m; HQ3: 47.6 – 377.6m; NQ2: 377.6 – 546.6m • MRN24013W1 - Diamond Drilling. NQ2: 88.9 – 453.6m. • MRN24014 - Diamond Drilling. PQ3: 0 – 53.7m; HQ3: 53.7 –359.6m; NQ2: 359.6 – 486.0m • HQ and NQ drill core was oriented using the Reflex ACT3 digital orientation tool
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Drill core recovery is recorded for each drilling run. The length of the run and the length of recovered drill core is recorded on core blocks completed for each core run. This is converted into a recovery percentage per drill run during drill core logging. • Where poor ground is expected – triple tube drilling techniques are used to maximise drill core recovery. • Overall – drill recoveries are very good. There is some core loss drilling through the transported cover sequence and through a zone of broken ground and deep weathering associated with the copper-gold mineralisation. • It is not known at this point in time whether there is a relationship between sample recovery and grade for material within the copper gold zone, or whether sample bias has occurred due to preferential loss or gain of material. • Sample recovery is not considered to be an issue for the fresh silver-lead mineralisation
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections*	• Drill core has been logged for lithology, alteration and mineralisation and geotechnical RQD has been recorded. Specific Gravity measurements have been taken using the Archimedes Method (Dry Weight/(Dry Weight – Wet Weight). Magnetic Susceptibility reading have been collected using a K10 Magnetic Susceptibility machine. • Logging of lithology and alteration is qualitative. Logging is

Criteria	JORC Code explanation	Commentary
	logged.	sulphide mineralisation considered to be semi-quantitative in nature. • All drill core has been photographed • The total length (100%) of recovered drill core for each drill hole has been logged.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representativity of samples.* • *Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Drill core was cut in half using an automatic core saw. Drill core was cut slightly off the orientation line, with sampling of the half core that did not have the orientation line. • A subset of samples in were sampled by quarter core so that half core samples for these intervals could be retained for metallurgical test work. • The sampling method utilized is considered appropriate for the styles of mineralisation at the Maronan project. • Certified Standards were inserted at a rate of 1:25 samples. Two different sets of standards are utilized, one for the lead, silver, zinc mineralisation (OREAS 135B; OREAS 136; OREAS 315; OREAS 317) and one for the copper, gold mineralisation (OREAS 520; OREAS 521; OREAS 522; OREAS 523; OREAS 601C) • Blanks were inserted at a rate of 1:25 samples. Additional blanks were used in the copper zone if native copper was observed • No duplicate second-half drill core samples have been submitted. • No specific grain size analysis has been completed on the Maronan project, however sampling methods utilized are consistent with those used by other mining and exploration projects targeting similar styles of mineralisation in the Mt Isa Belt.

Criteria	JORC Code explanation	Commentary
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• Samples were assayed by Au-AA25 (30g fire assay) technique for gold and the ME-MS61 method for Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Re, S, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn and Zr. For over limit samples of Ag, Cu, Pb, Zn, P and Mn samples are assayed by the ore grade OG-62 method. ME-MS61 is considered a "near total" digest method, with only the most resistive minerals (e.g. Zircons) only partly dissolved. Au-AA25 is considered a total assay method for gold. • The methods of assaying utilized are considered appropriate for the style of mineralisation targeted • Standard and Blank samples were inserted at a rate of 1:25 samples each. • The standards used displayed acceptable levels of accuracy and precision. Any QAQC failures are recorded in Maronan Metals QAQC action register and follow up actions are recorded. • A number of blank samples submitted for jobs prepared at the ALS Townsville lab showed low levels of carryover. This has been investigated and is not considered to be material to the assay results. The investigation suggests the carryover is related to smearing of metal onto the bowl and puck in mineralised samples. The Maronan sampling procedure has been modified as a result of this investigation to include quartz flushes between samples where lead grades above 3% are expected. This has been recorded in the QAQC register • No duplicates at the sampling stage were submitted. • The standards used displayed acceptable levels of accuracy and precision.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Assay results reported in this release have been compiled by Exploration Manager Andrew Barker, and reviewed by Mr Rob Rutherford and Mr Richard Carlton. • Logging is completed by two contract senior exploration geologists working for Maronan Metals, and is reviewed by Maronan Metals exploration manager. • MRN24003 and MRN24003W1 (reported on 25/9/2024) can be considered a set of twinned holes, that show good agreement between holes. MRN 24003/MRN24003W1 have a separation of around 3m within the silver-lead mineralisation

Criteria	JORC Code explanation	Commentary
		• Logging is saved into a logging template excel spreadsheet. Upon completion of logging, this data is uploaded into Maronan Metals Geobank Database. The Geobank Database is housed on an SQL server. A copy of the logging spreadsheet is saved on the Maronan Metals server. • Assays results are loaded into Maronan Metals Geobank Database. QAQC is checked on import, and issues identified are recorded in Maronan's QAQC register. • No adjustments are made to the raw assay data reported from the laboratory.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• All drill collars for the 2024 program at Maronan have been picked up by a licensed surveyor using an RTK-GPS in MGA94 Zone 54S coordinates. • Topographic relief has been surveyed with a lidar survey completed of the project area with a vertical accuracy of +/- 4cm • Downhole surveys are completed with a axis north seeking gyroscope.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Data spacing across the project is variable from approximately 200m x 200m to as close as 30m x 30m within some areas of the Starter Zone. • In areas of more closely spaced drilling (~ 50 x 50m or closer), geological and grade continuity is sufficient to classify indicated confidence resource. Where drill spacing is wider, resource confidence is inferred. • The drill pierce point spacing is sufficient to outline the structural geometry, broad extent of mineralisation and grade variations in the mineral system and is of sufficient spacing and distribution to infer a Mineral Resource. • No sample compositing has been applied in this report
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Silver-Lead mineralisation at the Maronan Project is hosted within a folded sequence of metamorphosed sedimentary rocks. The majority of mineralisation occurs on the short limb position striking roughly north-south and dipping between 60 – 70 degrees to the west. The average plunge of the fold axis' at the Maronan project is around 70 degrees toward 285. Drill holes drilled moderately steeply (-55 to -70 degrees) towards the west intersect the

Criteria	JORC Code explanation	Commentary
		mineralisation in the least biased orientation. • Estimated true widths have been estimated for the drillholes discussed in this release. • The estimated true width for MRN24010 and MRN24012 is 80% of the downhole width • The estimated true width for drill holes MRN24004, MRN24007, MRN24008, MRN24009, MRN24010W1, MRN24011, MRN24013, MRN24014 is 85% of the downhole width • The estimated true width for MRN23022W1 and MRN24013W1 is 90% of the downhole width. • For the Copper-Gold mineralisation – the trend of the mineralisation sits within a plane dipping 70 degrees to the west. There is a plunge component to the copper gold orientation with mineralisation plunging around 66 degrees toward 320 (moderately steep north). • The drilling orientation is not considered to have introduced a sampling bias
Sample security	• *The measures taken to ensure sample security.*	• Drill core is kept at the drill rig which is manned 24/7 until it is collected by Maronan Metals personnel. Maronan Metals personnel transport the drill core to Maronan Metals yard in Cloncurry. The yard in Cloncurry is secured by a six foot fence and gates are locked at all times when no personnel are at the yard. • Samples are either collected from the Maronan Metals yard by Cloncurry Couriers and transported to ALS Mt Isa, or delivered to ALS Mount Isa by Maronan Metals personnel • Samples are transported in sealed bulka bags. • Upon receipt on samples at ALS Mt Isa, the dispatch is checked and a sample receipt sent to Maronan Metals confirming the dispatch details.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• Maronan Metals completed an inspection of ALS Mt Isa Sample preparation facility in Mt Isa in April 2022 and had no adverse findings. • A selection of historic pulps from drilling completed by Red Metal between 2011 – 2014 were submitted to ALS Mt Isa for check assaying utilising the same assay protocol as the current Maronan Metal program. Results from this program display a very strong correlation between the original Red Metal assays and the

Criteria	JORC Code explanation	Commentary
		Maronan Metal check assays. • QAQC samples indicated low level contamination for samples prepared at the ALS Townsville Laboratory. This issue has been investigated and is not considered material at this point in time, but has resulted in a change to the Maronan sampling procedure to include quartz flush samples being used to clean bowls following samples estimated during logging to contain more than 3% lead

1.2 Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Maronan is located within EPM 13368 situated in the Cloncurry region of north-west Queensland. EPM 13368 is owned 100% by Maronan Metals Limited. No material ownership issues or agreements exist over the tenement. An ancillary exploration access agreement has been established with the native title claimants and a standard landholder conduct and compensation agreement has been established with the pastoral lease holders. • The tenements are in good standing and no known impediments exist
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• The extent of mineralisation at Maronan has been defined by 88 diamond core drill holes drilled by five different companies since 1987 until the present. Shell Minerals/Billiton/Acacia discovered base metal mineralisation on the project in 1987 and completed 16 shallow holes to 1993. From 1995 to 1996 MPI completed 3 holes into the northern and southern fold hinge structures. From 2001 to 2004 Phelps Dodge completed 6 holes. BHP Cannington undertook a campaign of lead-silver exploration from 2006 to 2008 completing 13 holes. Red Metal Limited completed 16 holes from 2011 to the 2019 seeking depth extensions to the bedded lead-silver and separate copper-gold mineralisation. Maronan Metals was spun out of Red Metals in 2022 and has continued progressing exploration

Geology	• *Deposit type, geological setting and style of mineralisation.*	• Exploration on Maronan has identified three separate styles of mineralisation, bedded lead-silver mineralisation partially overprinted by structurally controlled, copper-gold mineralisation, and gold only mineralisation • The lead-silver mineralisation is of a similar style to the nearby Cannington deposit, one of the world's largest silver and lead producing operations. The Maronan lead-silver mineralisation occurs in two separate but sub-parallel banded carbonate-lead sulphide-magnetite-calcsilicate units referred to as the Western Horizon (Upper) and Eastern Horizon (Lower. The two horizons can be separated by between 30 to 100 metres of quartz clastic meta-sediments (psammite, pelite and quartzite). • An interpreted overprinting copper-gold mineralisation can be compared with the ISCG mineralisation styles at the nearby Eloise and Osborne ore bodies. Mineralisation is associated with intense silica alteration within a bedding-parallel structure focused between the Western and Eastern Lead-Silver mineralised zones and comprises variable pyrite-magnetite and pyrrhotite mineralisation pyrrhotite with variable chalcopyrite. • Gold only mineralisation occurs in the Northern Fold area, up-plunge on bedded Lead-Silver mineralisation within the Eastern Horizon and is associated disseminated arsenopyrite within strong magnetite-carbonate facies/alteration. This zone appears to transition down-plunge to carbonate-sulphide dominant

Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* o *easting and northing of the drill hole collar* o *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* o *dip and azimuth of the hole* o *down hole length and interception depth* o *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Drill hole location data including the dip, azimuth and hole depth is included as Appendix 2 to this ASX release. • A table of significant drill intercepts in included as Table 1 in the body of this ASX release • Full assay results for Ag, Au, Cu, Pb and Zn in the reported holes are included as Appendix 3
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Assay results have been reported using length-weighting technique to calculate down hole average grades. No top-cuts have been applied. • A cut-off grade of 1% Lead has been used for reporting of Silver-Lead intervals. A cut-off grade of 0.3% Copper have been used for reporting Copper-Gold intervals • Due to the poly-metallic nature of mineralisation at Maronan, intervals of mineralisation below the cut-off may be included within a broader mineralised zone, Internal dilution below cut-off is also permitted where geological continuity of a particular zone is inferred. • Aggregate intercepts have been included – for example: o Lead-Silver Mineralisation o 31.0m (25.0m etw) at 5.1% Pb, 70g/t Ag from 407m downhole including; ▪ 4.9m (4.0m etw) at 13.9% Pb, 191g/t Ag, 1.2% Zn from 423m downhole In this example, the sub-interval contains significantly higher grade than the broader interval.

		In addition to reporting the raw assay results, Silver-Lead results have been reported as Silver Equivalent (AgEq). The Silver Equivalent value is considered an appropriate method for reporting combined silver, lead mineralisation at Maronan because of the exceptional metallurgical recovery of both the lead and silver and the resulting concentrates very high silver content and low levels of penalty elements. The silver equivalent calculation takes into account the metallurgical results that highlighted simple processing routes to achieve recoveries of 95% for the lead and 91% for the silver (refer to Maronan Metals Limited (MMA) ASX announcement dated 18 Feb 2025). Only Lead and Silver assays are included in the Silver Equivalent calculation • **Silver Equivalent** was calculated using the formula: AgEq = ((Pb (%) * Pb^{rec} *Pb^{price}) + (Ag (g/t)*Ag^{rec}*Ag^{price}) / Ag^{price} • Pb (%) is the weight percent assay grade for Lead • Pb^{rec} is the assumed metallurgical recovery of 95% for lead based on previous testwork at Maronan • Pb^{price} is the value of 1% Lead based on a price assumption of $USD2000/tonne). In this instance the value of $20 • Ag (g/t) is the assay grade in grams/tonne of silver • Ag^{rec} is the assumed metallurgical recovery of 91% for silver based on previous testwork at Maronan • Ag^{price} is the value of 1g/t Silver based on a price assumption of $USD25/ounce). In this instance the value of $0.804 • The formula calculates the value of the recoverable metal for Lead and Silver and divides with by the value of 1gm Silver to calculate the Silver Equivalent value This Silver Equivalent calculation does not take into account any assumptions about payability, treatment costs or refining costs

Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Drill holes are interpreted to have intersected the mineralisation at an appropriate intersection angle. • Modelled zones of mineralisation at the Maronan Project strike approximately 010 and dip ~ 70W. • Estimated True Widths are reported in Significant Intercept Table 1 of the report and are discussed above in Section1 of the table
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Plan view, cross sectional and long section views are included within the body of the ASX release (Figure 1 to Figure 9)
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• All assay results for, gold, silver, copper, lead and zinc for MRN23022W1, MRN24004, MRN24007, MRN24008, MRN24009, MRN24010, MRN24010W1, MRN24011, MRN24012, MRN24013, MRN24013W1 and MRN24014 are reported in Appendix 2 of this ASX release.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Maronan Metals announced results of Metallurgical testwork performed on drill hole MRN24002 from this current program. The results are summarised in ASX Release 18 Feb 2025 – Outstanding Silver-Lead Metallurgy Results • Geotechnical Test Work is currently being undertaken by Maronan Metals. Results will be released once this work has been completed. • Maronan Metals routinely collects bulk density measurements for samples. Bulk density is measured using the Archimedes method. There is around 5230 bulk density measurements for the Maronan Project. Prior to the 2024 drill program. Sticks of core averaging around 30cm were selected at regular intervals down the drill hole. For the 2024 program, this was modified and bulk density samples were taken to match assay sample intervals. Selection of samples was focused on mineralised domains. BUlkd density is variable across the Maronan Deposit. Typically, the bulk density for Carbonate Silver-Lead ore is between 3.0 – 3.1g/cm3. Bulk density for pyroxene silver-lead ore is between 3.7 – 3.9g/cm3 and density for fresh copper-gold mineralisation is around 2.8g/cm3 • Red Metals Limited (ASX:RDM) who held EPM13368 prior to

		Maronan Metals completed a Regional Moving Loop Electromagnetic Survey over EPM13368 (ASX Announcement 18 July 2018) that identified a number of potential targets away from the Maronan Deposit. One of these targets (the Northern Target) was identified as a high priority moderate strength conductor (1500 S) that should be followed up with drilling. Maronan intend to test this target during 2025. The target is located at approximately 491800mE, 7672375mN. The plate is modelled to start approximately 100m below surface, strikes north-south and is modelled to be around 200m long.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Maronan Metals intends to progress activities at the Maronan Project towards the development of a mine. Maronan Metals have publicly discussed intentions to progress an MDL application to cover the Maronan Project, with the potential to develop and Exploration Decline. • Exploration activities will continue to focus on converting resource from the inferred to indicated category, while also targeting shallow under drilled areas north of the starter zone, and proximal to the location of a potential exploration decline. • Mineralisation on the Eastern and Western Horizon Pb-Ag domains remains open down plunge, and requires additional drilling to increase confidence in the existing resource. • The Maronan Copper-Gold resource is open down plunge. Further infill drilling is required to upgrade the resource from inferred to indicated category.
