QUARTERLY ACTIVITIES REPORT
FOR THE PERIOD ENDING 31 MARCH 2017

Figure 1 –Chip trays for RC drilling at Quicksilver

HIGHLIGHTS

QUICKSILVER NICKEL-COBALT, SOUTH WEST, WA

- **Resampling of RC drilling confirms high-grade nickel intercepts, including:**

QRC040 10m @ 2.10% Nickel & 0.10% Cobalt from 55m
Including 2m @ 3.30% Nickel & 0.14% Cobalt from 57m

QRC087 22m @ 1.21% Nickel & 0.05% Cobalt from 22m
Including 1m @ 3.85% Nickel & 0.12% Cobalt from 30m

- **A further program of >5,000 metres of RC drilling was commenced during the quarter to test the supergene nickel mineralisation and facilitate down hole EM over high priority geophysical targets**
- **A Moving Loop Electromagnetic ('MLEM') geophysical survey has highlighted FOUR significant anomalies at depth that potential represent the primary source of the nickel mineralisation**
- **Permitting and access for the drilling of the priority EM targets has been completed.**

Golden Mile Resources (ASX: G88) ("Golden Mile" or **"Company")** is pleased to report on the ongoing exploration program over the Quicksilver nickel-cobalt project in the South-West and the Company's gold projects in the North-Eastern Goldfields.

1. Quicksilver Nickel-Cobalt Project, South West Mineral Field, WA

The exploration & development program at Quicksilver has continued through the first quarter of 2018, including:

- **Resampling** of the 2017 RC drilling program (QRC 027-092)
- **Moving Loop Electromagnetics** ('MLEM') over 5 km of strike
- **Extensional RC drilling** over targets to the west of the existing drill pattern
- Drilling of holes over MLEM targets to facilitate **Down Hole EM** ('DHEM')
- Surveying and on-ground validation of drilling in preparation for the **Estimation of a JORC 2012 resource.**

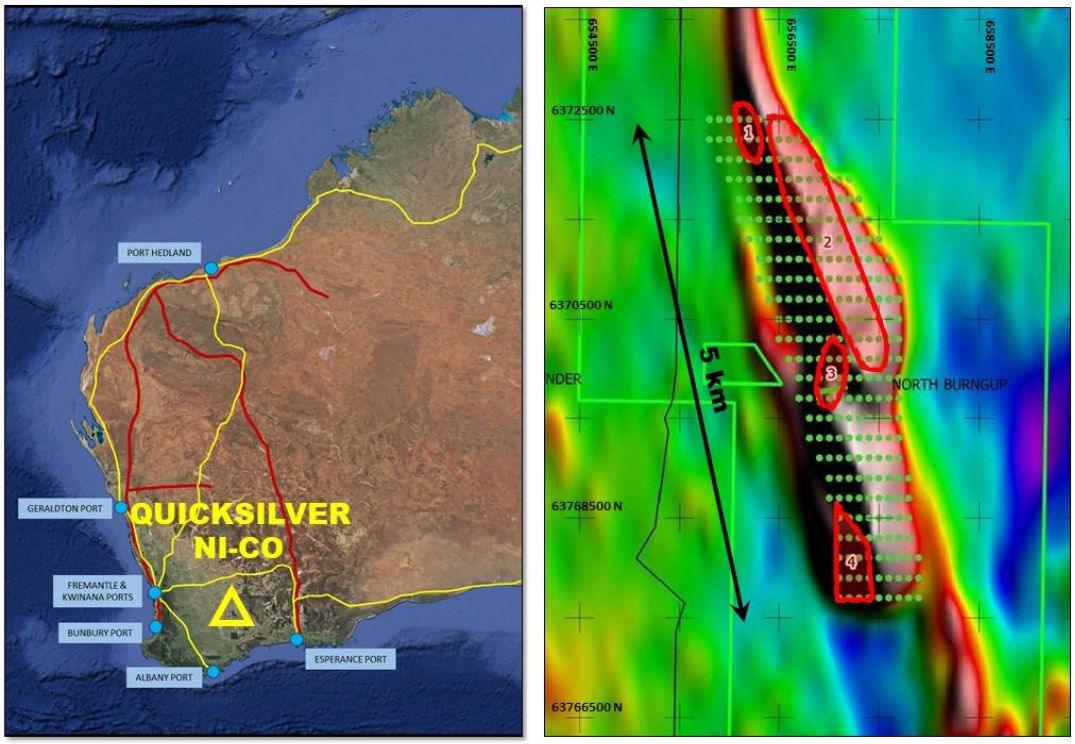

Figure 2 – Quicksilver project location (left) and magnetic imagery with tenement outline (green) and MLEM targets, Anomalies 1-4 in red (right).

1.1 Quicksilver RC Resampling

The resampling of the RC drilling program was completed in late 2017. Anomalous composite samples (>1,000 ppm nickel and/or 100 ppm Cobalt) were resampled using one metre splits, with over 4,200 metres of drilling resampled. The volume of resampling shows **the highly anomalous nature of the host ultramafic unit at Quicksilver.**

The high volume of samples resulted in the assay program at being divided up into four batches that were reported during the first quarter of 2018. These samples confirmed, and in many cases extended, the recognised **nickel and cobalt mineralisation** with the profile at Quicksilver.

Resampling confirmed **outstanding intercepts of nickel mineralisation in the RC drilling** and included:

QRC033	**54 metres @ 0.65% Nickel & 0.03% Cobalt**	**from 13 metres***
Including	**10 metres @ 1.35% Nickel & 0.06% Cobalt**	**from 14 metres**
QRC040	**42 metres @ 1.14% Nickel & 0.06% Cobalt**	**from 26 metres**
Including	**10 metres @ 2.12% Nickel & 0.10% Cobalt**	**from 55 metres**
With	**2 metres @ 3.30% Nickel & 0.14% Cobalt**	**from 57 metres**
QRC041	**28 metres @ 0.99% Nickel & 0.04% Cobalt**	**from 52 metres**
Including	**12 metres @ 1.23% Nickel & 0.07% Cobalt**	**from 52 metres**
And	**3 metres @ 1.08% Nickel & 0.02% Cobalt**	**from 77 metres***
QRC042	**71 metres @ 0.45% Nickel & 0.02% Cobalt**	**from 5 metres**
QRC047	**24 metres @ 0.75% Nickel & 0.15% Cobalt**	**from 21 metres**
Including	**6 metres @ 1.51% Nickel & 0.37% Cobalt**	**from 24 metres**
QRC054	**29 metres @ 0.93% Nickel & 0.04% Cobalt**	**from 43 metres**
Including	**3 metres @ 1.43% Nickel & 0.14% Cobalt**	**from 47 metres**
And	**10 metres @ 1.16% Nickel & 0.02% Cobalt**	**from 62 metres**
QRC064	**5 metres @ 1.11% Nickel & 0.01% Cobalt**	**from 17 metres**
QRC087	**22 metres @ 1.21% Nickel & 0.05% Cobalt**	**from 22 metres**
Including	**1 metre @ 3.85% Nickel & 0.12% Cobalt**	**from 30 metres**
QRC091	**11 metres @ 0.88% Nickel & 0.02% Cobalt**	**from 12 metres**
Including	**2 metres @ 1.38% Nickel & 0.04% Cobalt**	**from 22 metres**

**These intercepts are in the bottom of the drill holes and indicate that the nickel mineralisation extends into fresh rock.*

An updated drill hole plan is shown as Figure 3.

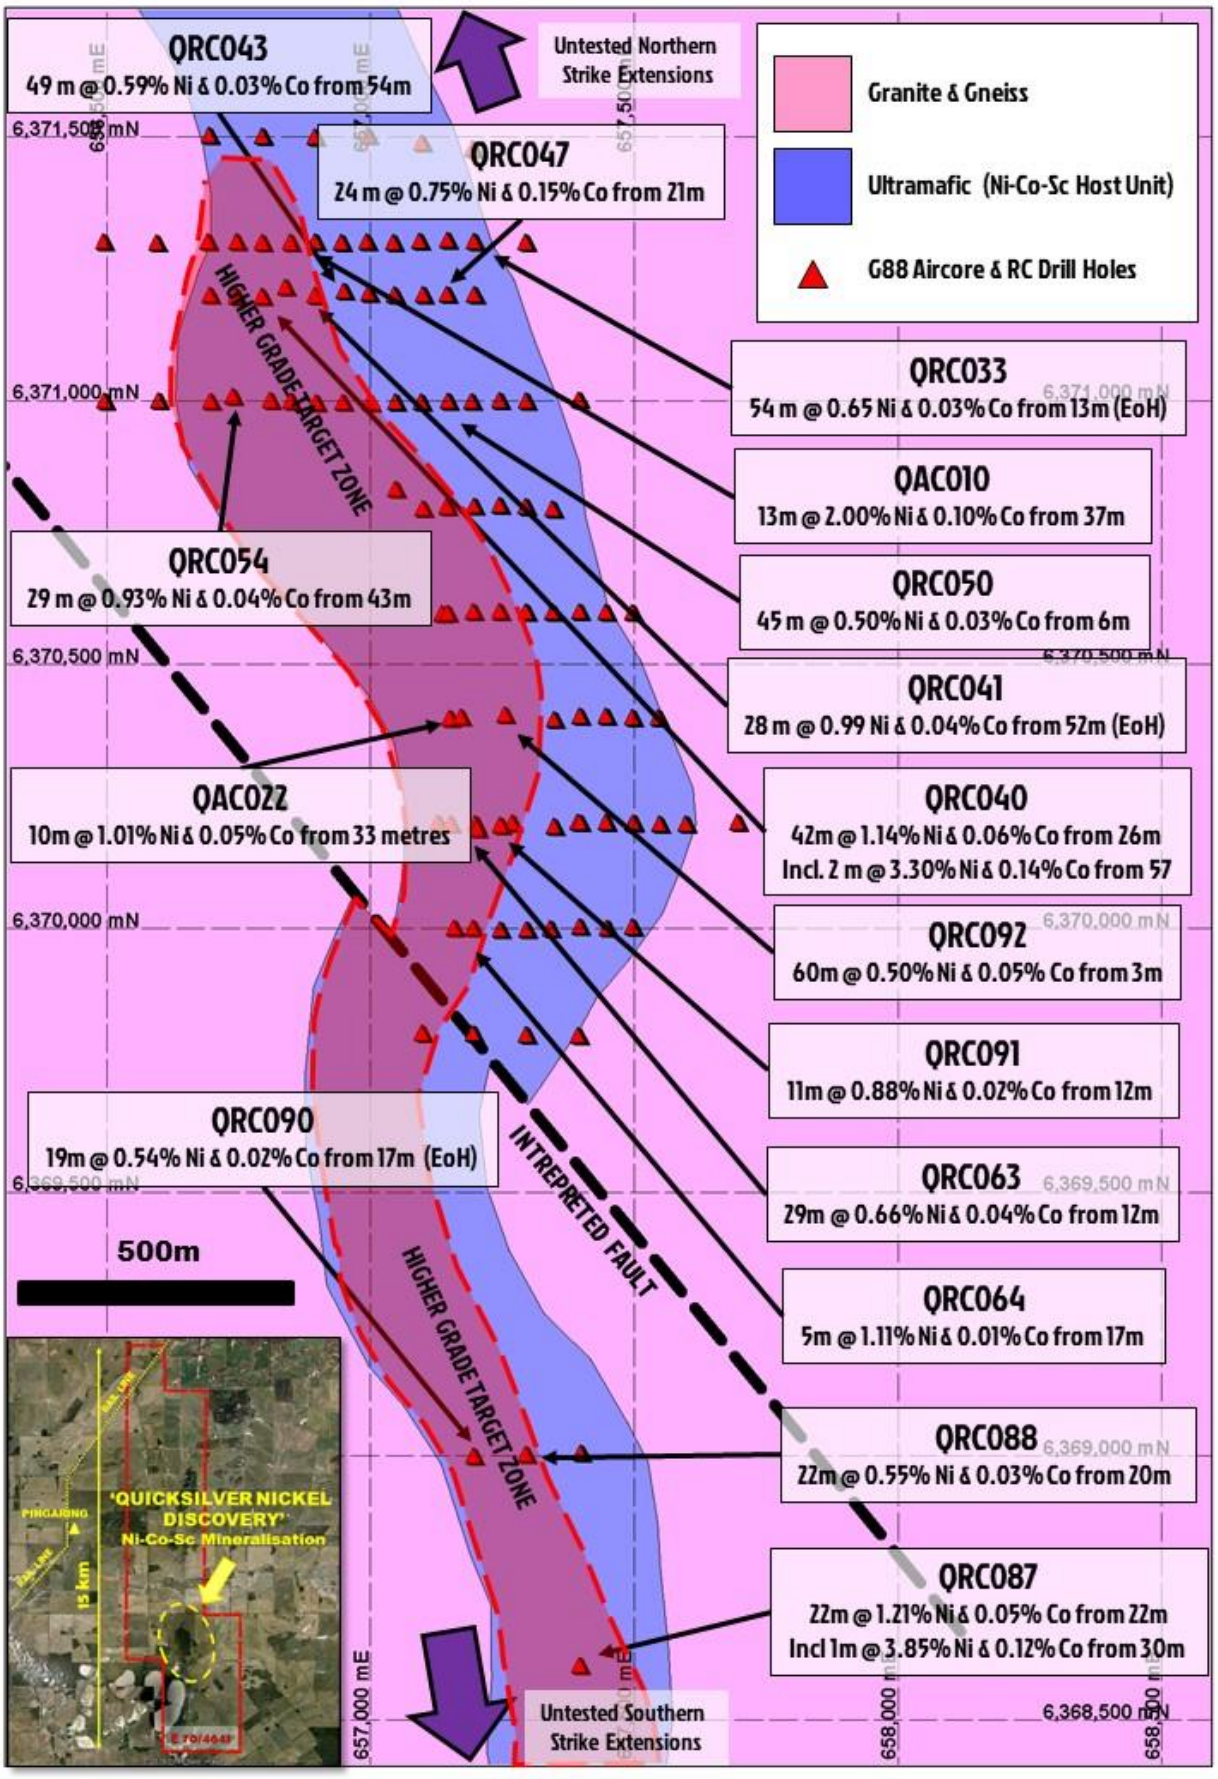

Figure 3 – Aircore & RC drill hole locations with significant nickel & cobalt intercepts over interpreted geology, with higher-grade target zone (red).

1.2 Quicksilver Geophysical Program

A MLEM survey was completed over the southern Quicksilver tenement area during the quarter. The survey designed by Newexco Services Pty Ltd ('Newexco') to test for deeper primary sulphide sources for the nickel mineralisation. The survey extended over 5 km of strike and comprised 100 metre spaced stations along 200 metre spaced east-west oriented lines. A total of 276 stations were utilised and cover more than 25 'line' kilometres.

The MLEM **successfully highlighted FOUR significant anomalies** for additional testing (Figure 4):

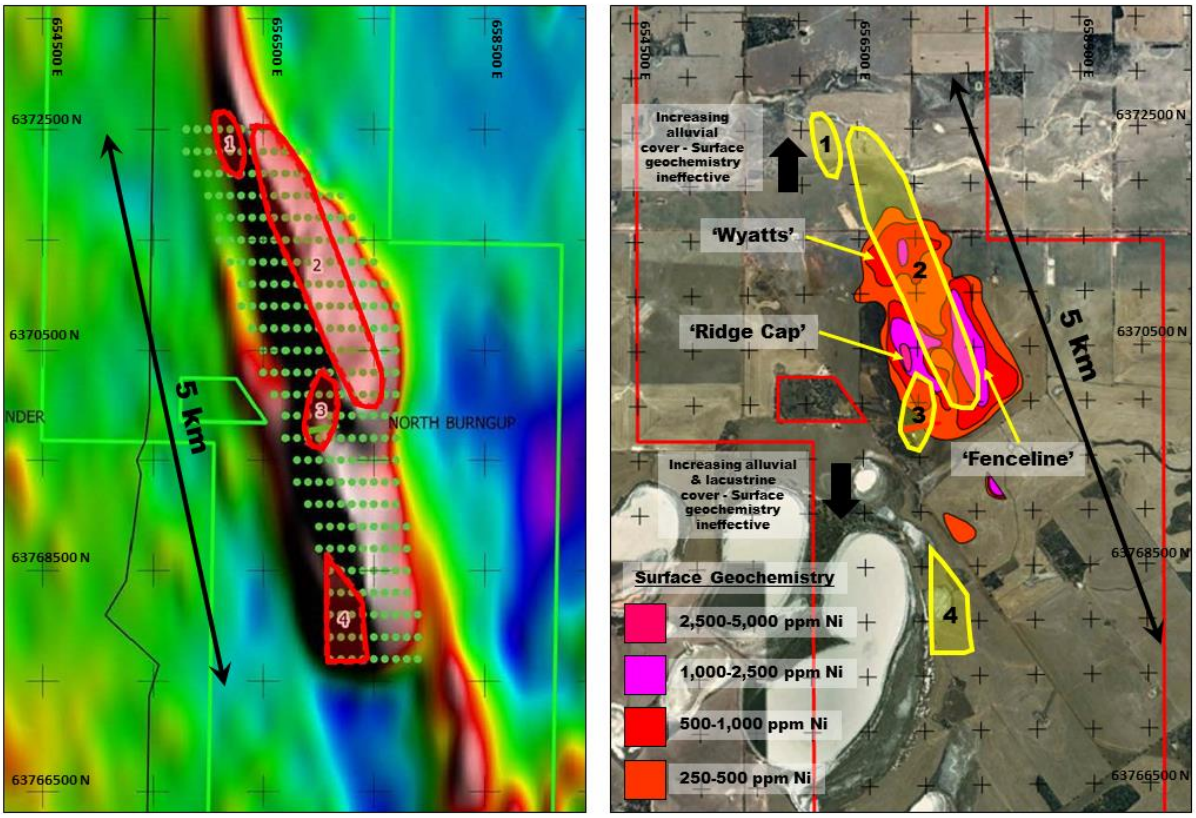

Figure 4 – Quicksilver MLEM anomalies over RTP magnetic image (right) and established surface nickel geochemistry with MLEM anomalies (left).

A. Anomaly 1

This conductor has been rated as a **'Category 1'** (highest priority) anomaly and is recommended for immediate drill testing by Newexco, due to the strong and consistent nature of the geophysical response.

The anomaly exhibits the following characteristics:

- **Is over 500 metres long with a north-south orientation**
- **Lies in a sub-vertical orientation, with the top of the EM anomaly approximately 100 metres below surface**
- **Is '…consistent with a massive sulphide bedrock conductor'[1]**

- **The '…modelled conductance is 6700 Siemens and is in the range of expected values for nickel sulphide targets[1]**

The Company has recently secured access and had a Program of Works ('PoW') over the target approved. Exploration over the target will commence once the results of the DHEM over Anomalies 2 & 3 are received.

B. Anomaly 2

This anomaly is a laterally extensive target but does not have as strong an EM response as Anomaly 1. It is interpreted to define deeper weathering and/or higher conductance geology that is often associated with ultramafic rocks.

This is consistent with observations from the RC drilling, where ultramafic stratigraphy, disseminated sulphides and significant nickel intercepts have been recorded in the bottom of several drill holes.

The anomaly exhibits the following characteristics:

- **Covers over 2,500 metres of strike**
- **Is a shallow bedrock anomaly and is unconstrained by the EM survey at depth**
- **Shows a strong surface geochemical signature, being coincident with the 'Fenceline' & 'Wyatt's' surface anomalies (Figure 4)**
- **Drilling ABOVE the anomaly has consistently returned wide (>20m) and significant intercepts of nickel (>0.5%) in shallow RC drilling (<100 m deep)**
- **Drilling above the anomaly has also returned high-grade nickel (>2%) intercepts in both Aircore & RC drilling including:**

  QAC010 13 metres @ 2.00% Nickel & 0.10% Cobalt from 37 metres

  QRC040 10 metres @ 2.12% Nickel & 0.10% Cobalt from 55 metres

- **This bedrock anomaly remains completely untested drilling, whilst only around two-thirds of the saprolitic zone above the anomaly has been tested with shallow RC drilling (Figure 5).**

The weathered zone above Anomaly 2 hosts much of the saprolitic nickel-cobalt mineralisation delineated to date, however the bedrock source of this mineralisation remains untested and **has the potential to host a substantial body of disseminated sulphides**. This anomaly will be further tested through the ongoing drilling program and will also be assessed to determine its suitability for targeting utilising alternative geophysical methods, such as induced polarisation ('IP') – two drill holes have been emplaced near high-grade drill holes QRC 040 & 041 to facilitate DHEM.

C. Anomaly 3

This anomaly lies in the southern Garard prospect area and immediately to the east of the existing RC drill pattern (Figures 4 & 5). The anomaly appears to be associated with a fault that displaces the host ultramafic unit but may be a deeper source (below 200 metres) and is poorly defined by the MLEM survey.

The anomaly exhibits the following characteristics:

- **Covers over 500 metres of strike**
- **Is immediately adjacent, to the south, of the 'Ridge Cap' surface geochemical anomaly (Figure 4) which shows some of the highest grades of surface nickel anomalism, including QSS 029 2720 ppm Ni & 305 ppm Co**
- **May be a deeper conductive source and requires Downhole EM ('DHEM') to better define a target.**

Newexco recommended the use of Downhole EM ('DHEM') to close on the potential source of this anomaly to define its location & orientation at depth. Three angle drill holes were emplaced over the top of Anomaly 3 as a part of the recent RC drilling program with the results of the DHEM expected to be reported during the next quarter (Figure 5).

D. Anomaly 4

Anomaly4 lies in the southern tenement area near an area of salt lakes. These lakes, and their associated sediments, are moderately conductive with analysis of the EM data suggesting that an anomaly at depth may be masked by these near surface sediments (Figures 4 & 5).

The anomaly exhibits the following characteristics:

- **Covers over 900 metres of strike, and is potentially open to the south**
- **Is immediately adjacent to the southern-most drill hole in the program to date, which returned a high-grade nickel (>2%) intercept of:**

  QRC 087 22 metres @ 1.21% Nickel & 0.05% Cobalt from 22 metres

- **Newexco have again recommended that as the drill pattern is extended over the anomaly and a program of DHEM be employed to better define any anomaly that may lie at depth.**

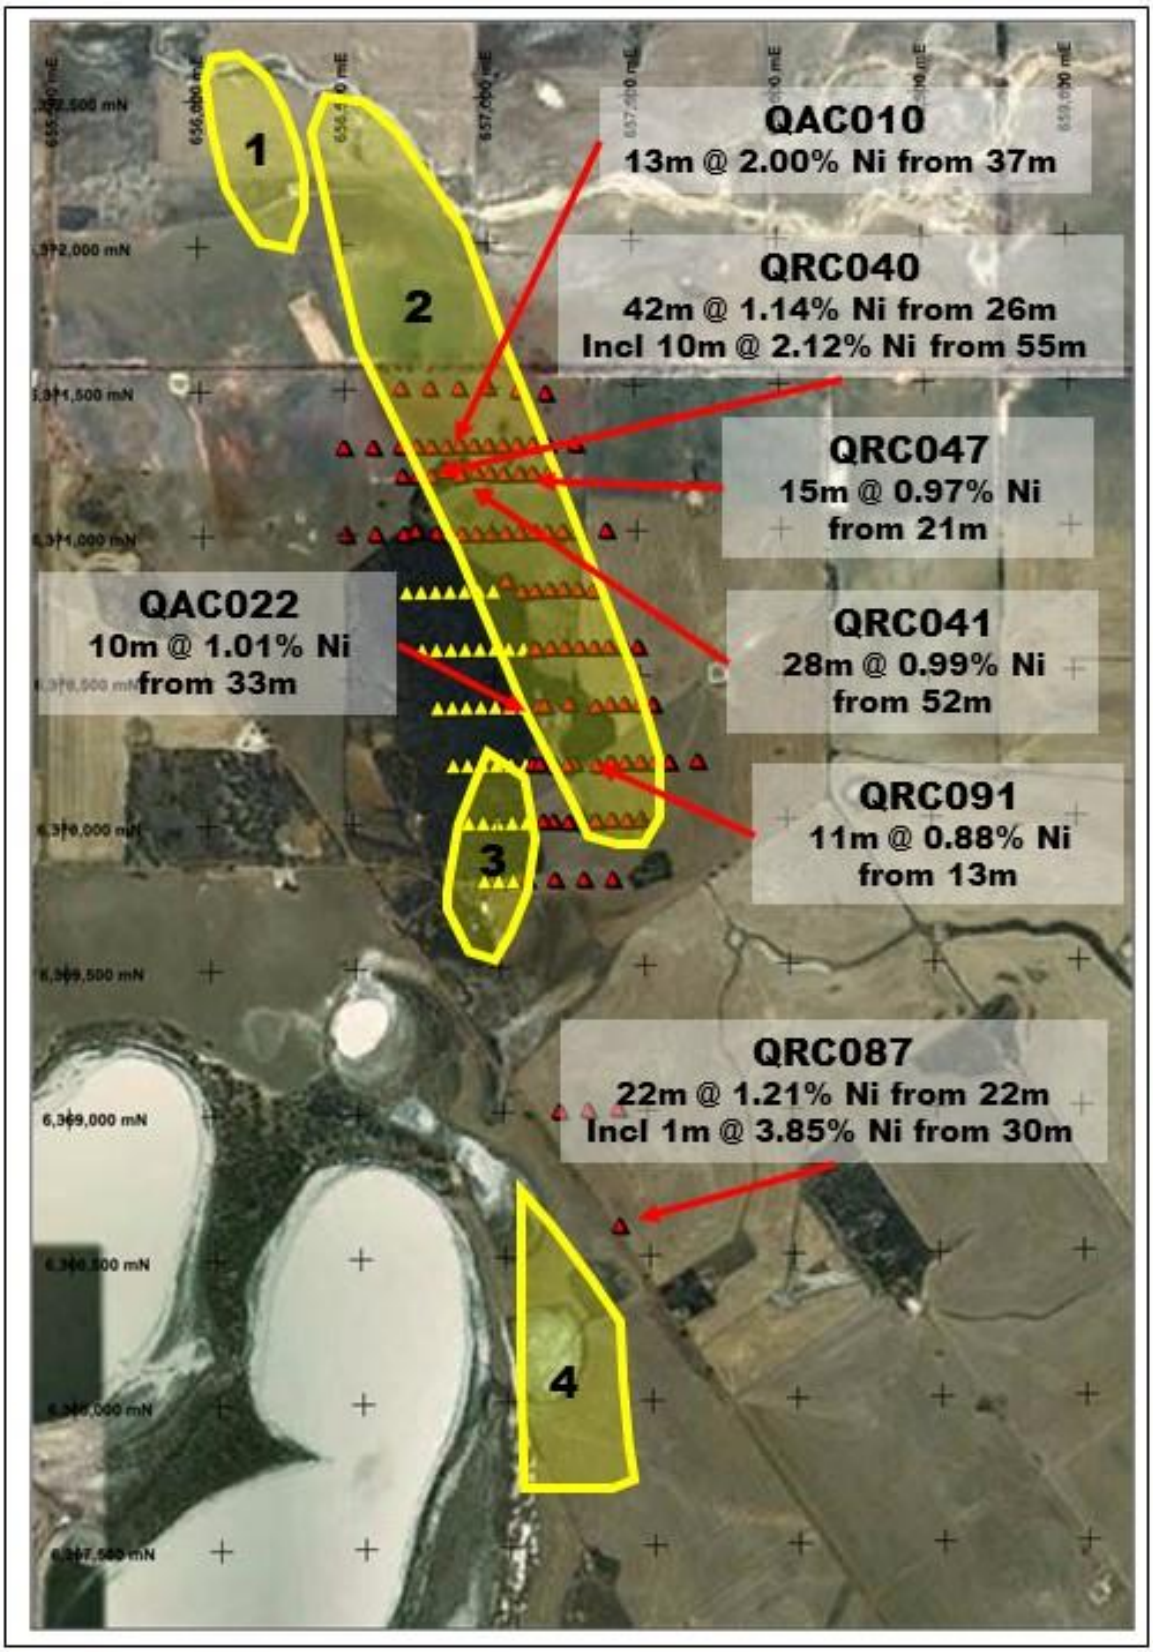

Figure 5 – Quicksilver MLEM anomalies over Google Earth image, showing existing G88 drill hole locations (red) with >1% nickel intercepts and planned infill/extensional RC drilling (yellow).

The MLEM program has been highly successful in targeting potential bedrock sulphide anomalies for further DHEM and drill testing.

1.3 Extensional RC Drilling

A program of extensional RC drilling was commenced March 2018 and completed in late April 2018 (results pending). The extensional program focussed on two areas:

A. Supergene Nickel-Cobalt Mineralisation

A second phase of reverse circulation ('RC') drilling has now been completed over a significant target to the west of the known mineralisation at Quicksilver (Figure 3).

A total 51 extensional RC drill holes (>4,500 metres) were drilled, in addition to several redrills of the previous shallow aircore drilling. This drill program has produced over 5,000 samples which have now all been received by the laboratory in Perth.

Results have been delayed in recent weeks due the breakdown of key equipment at the laboratory however they are clearing the resulting 'backlog' with initial assay results from the Quicksilver RC drilling now expected in early May 2018.

B. Down Hole Electromagnetics ('DHEM')

A series of five drill holes have been placed over Anomalies 2 & 3 (Figures 2 & 3) to facilitate a program of down hole electro-magnetics ('DHEM') to better define these potential conductors.

Three, 156-metre deep, angle RC holes were emplaced over Anomaly 3 to better test and define this target at depth. In addition, a further two RC drill holes were emplaced to 180 metres depth over Anomaly 2. These holes were drilled near QRC 040 & 041 to test for the potential primary source of the known mineralisation in this area.

These holes have all been cased with PVC and prepared for the DHEM survey, which is expected to commence in the first weeks of May 2018.

1.4 Other Work programs at Quicksilver

A field review of the project was undertaken by specialist consultant Lynn Widenbarr during the quarter. Mr Widenbarr has been contracted by the Company to supervise and undertake the estimation of a JORC 2012 resource for the supergene component of the nickel mineralisation.

Exploration continues to extend the recognised mineralisation at Quicksilver, which now extends over **more than FIVE kilometres of strike**. Golden Mile looks forward to updating shareholders and investors as the results of the exploration and development program at Quicksilver continue to be received during the coming quarter.

2. Gold Projects, Northeastern Goldfields, WA

2.1 Ironstone Well Gold – Leonora Region, NE Goldfields

- Evaluation of additional targets within project area
- Prospecting within the project area

2.2 Leonora East Gold – Leonora Region, NE Goldfields

- Ongoing surveying and evaluation of high-grade gold locations, including mine workings
- Detailed analysis and target generation for exploration, including drilling
- Prospecting within the project area
- Data compilation & evaluation

2.3 Darlot Gold – Leonora Region, NE Goldfields

- Prospecting and near surface gold mineralisation evaluations
- Data compilation & evaluation to target ongoing exploration

2.4 Gidgee Multi-Element Project – Northern Yilgarn

- Data compilation & evaluation to target future exploration

Golden Mile looks forward to updating investors as the Company's exploration program progresses during the second quarter of 2018.

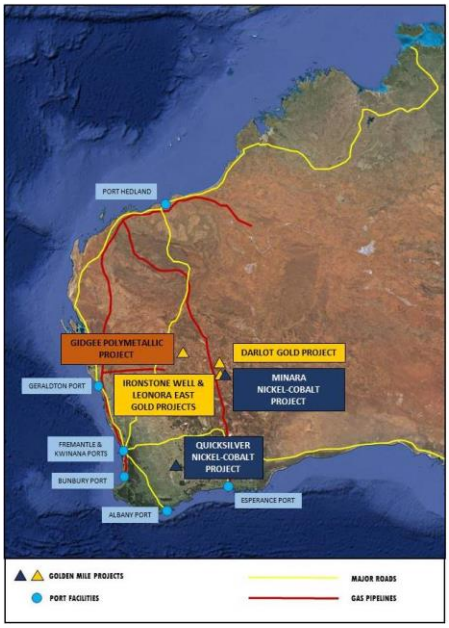
About Golden Mile Resources Ltd



Golden Mile Resources is an Australian based exploration and development company, with an outstanding suite of cobalt, gold, and base metal projects in Western Australia. The Company was formed in 2016 to carry out the acquisition, exploration and development of mining assets in Western Australia, and has to date acquired a suite of exploration projects, predominantly within the fertile North-Eastern Goldfields of Western Australia.

The Company's portfolio includes two nickel-cobalt projects, namely the Quicksilver project in the South West Mineral Field and the Minara project in the North-Eastern Goldfields.

In addition, Golden Mile holds a suite of gold projects adjacent to Leonora which include the Ironstone Well & Leonora East projects.

The Company also holds the Darlot Gold project to the north of Leonora and the Gidgee Polymetallic project north of Sandstone.

For more information please visit the Company's website: https://www.goldenmileresources.com.au/

Exploration Targets

The term 'Exploration Target' should not be misunderstood or misconstrued as an estimate of Mineral Resources and Reserves as defined by the JORC Code (2012) and therefore the terms have not been used in this context. The potential quantity and grade of the Exploration target is conceptual in nature and there has been insufficient exploration to date to allow the estimation of a Mineral Resource. In addition, it is uncertain if further exploration will result in the estimation of a Mineral Resource.

Competent Persons Statement

The information in this report that relates to Exploration Targets, Exploration Results, Mineral Resources or Ore Reserves is based upon information compiled by Mr Timothy Putt, a Competent Person who is a Member of the Australian Institute of Geoscientists. Mr Putt is the Managing Director of Golden Mile Resources Ltd, a full- time employee and shareholder of the Company.

Mr Putt has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Putt consents to the inclusion in the report of the matter based on his information in the form and context in which it appears.

Forward-Looking Statements

This document may include forward-looking statements. Forward-looking statements include, but are not limited to, statements concerning Golden Mile Resources Ltd (ASX: G88) planned exploration program and other statements that are not historical facts. When used in this document, the words such as "could," "plan," "estimate," "expect," "intend," "may", "potential," "should," and similar expressions are forward-looking statements. Although Golden Mile Resources Ltd (ASX: G88) believes that its expectations reflected in these forward-looking statements are reasonable, such statements involve risks and uncertainties and no assurance can be given that actual results will be consistent with these forward-looking statements.

A. Ni = Nickel, Co = Cobalt, Cu = Copper, Fe = Iron, SiO_2 = Silica

B. ppm= part per million, % = percentage, N/A = No Assay

APPENDIX 2 – JORC TABLES

Appendix 1 JORC Code, 2012 Edition – Table 1

Section 1 - Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• A total of 66 reverse circulation drill holes were completed as part of the ongoing exploration program over the Quicksilver Project • In total, these drill holes yielded over 1,200 samples, comprised of composite samples, standards and blanks. • Drill samples were composed of 4 metre composites spear sampled from the 1 metre intervals produced from drilling, leaving the rotary split, 1 metre calico samples, for later resample. • All composites with assay values of over 1,000 ppm Nickel and/or 100 ppm cobalt have been resampled utilising the above mentioned rotary splits.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• RC drilling (5.25" face sampling bit) was utilised to test the weathered stratigraphy through to fresh rock
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• All samples and subsamples were weighed to assess recovery • Very little sample loss was observed at the collar • There appears to be no sample bias or relationship between grade and sample recovery
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate*	• Small subsamples of the 1m drill intervals were collected and placed in a chip tray,

	Mineral Resource estimation, mining studies and metallurgical studies. ● *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* ● *The total length and percentage of the relevant intersections logged.*	● All drill holes were geologically logged, noting lithologies, veining and alteration, from their collar to the end of hole.
Sub-sampling techniques and sample preparation	● *If core, whether cut or sawn and whether quarter, half or all core taken.* ● *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* ● *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* ● *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* ● *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* ● *Whether sample sizes are appropriate to the grain size of the material being sampled.*	● Samples were collected in two ways, 1. A rotary split of approximately 2 kg was taken on 1m intervals directly from the cyclone of the drill rig (for later resample), and 2. A spear sample, from the remaining drill spoil, was taken to produce a 4m composite of the down hole drilling for initial assay. ● Blanks and standards were introduced as checks through both Golden Mile sampling on site and by LabWest in Malaga.
Quality of assay data and laboratory tests	● *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* ● *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* ● *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	● The laboratory assaying techniques are suitable for the samples submitted. Samples were submitted to LabWest in Malaga, Perth, for a suite of elements including Ag, Co, Cr, Cu, Fe, Mg, Mn, Ni & Sc using an MAD prep and ICP analysis. ● Golden Mile introduced a mix of standards and blanks throughout the sample runs on a 1:20 ratio to ensure QC, ● Labwest also initiated duplicate sampling and ran their own standards as part of the assay regime.
Verification of sampling and assaying	● *The verification of significant intersections by either independent or alternative company personnel.* ● *The use of twinned holes.* ● *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* ● *Discuss any adjustment to assay data.*	● Samples were collected, sampled and verified by independent geological consultant in the field and physically checked by Company personnel in the field before submitting to LabWest for assaying. ● Sampling and logging has been undertaken in hardcopy format prior to being entered into the Company's digital database. ● No adjustments to assay were done.
Location of data points	● *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.*	● Drill holes were located using a hand held GPS (accurate to <5 metres) in GDA 94, Zone 50.

	• *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Drilling was undertaken on 200 x 50 metre centres across the Quicksilver prospect • Spacing is insufficient to establish a resource at this time, although an 'Exploration Target' has previously been put forward • Samples down hole are reported as 4m composites, with 1m resamples being reported
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Sampling is unbiased and was designed to test the weathered and fresh lithologies in the profile and both drill and sampling orientations have been optimised to this end • No bias is recognised at this time due to drill orientation.
Sample security	• *The measures taken to ensure sample security.*	• Samples were bagged and secured by field staff prior to submission to the laboratory.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• At this preliminary stage no audits of sampling technique were done.

Section 2 - Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• E 70/4641 overlies both private and crown land with access agreements in place over the landowners where the active work program is being undertaken.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Compilation of historical data has been completed and is being utilised to target the ongoing work program.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• Ultramafic hosted nickel, cobalt & scandium mineralisation.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* o *easting and northing of the drill hole collar* o *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* o *dip and azimuth of the hole* o *down hole length and interception depth* o *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• A listing of the drill hole collar information is provided in Appendix 2. Of this report.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Weighted averages have been used in the calculation of drill hole intercepts • Lower cut-offs have included 300 ppm or 0.03% for Cobalt and 3,000 ppm or 0.3%for nickel • Most individual samples are now 1 metre splits • Allowable internal dilution was set at up to 4m for Ni-Co intercepts • No ‘metal equivalents’ have been quoted.

Relationship between mineralisation widths and intercept lengths	● *These relationships are particularly important in the reporting of Exploration Results.* ● *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* ● *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	● At this point we believe that the mineralisation is 'sub-horizontal' and as such the drill hole dip, predominantly vertical, represents true width.
Diagrams	● *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	● Maps are presented in the accompanying ASX announcement.
Balanced reporting	● *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	● A listing of all the results from the reported intercepts is provided in Appendices 1 of this report.
Other substantive exploration data	● *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	● These factors are discussed in the body of the accompanying ASX report.
Further work	● *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* ● *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	● The ongoing work program and discussion of targets for drilling is contained in the body of the report.
