

Significant PGE Potential Identified in Lamboo Ultramafic Complex on Peako's East Kimberley Project

31 January 2022

Highlights

- Potential identified for a large PGE mineralised system within the known Lamboo Ultramafic Intrusive Complex on Eastman Tenement
- The prospective Intrusive Complex extends for 16.5km within the Eastman Tenement, with structural repetition further enhancing prospectivity
- Anomalous PGE intercepts returned from wide-spaced historical drilling over the entire 16.5km strike length of the Lamboo Ultramafic Complex on the Eastman Tenement
- New PGE Exploration Model for the Lamboo Ultramafic Intrusive Complex in the Eastman Tenement further validated by the recent wide PGE and gold intercepts released by Pantoro Limited at its nearby Halls Creek Project

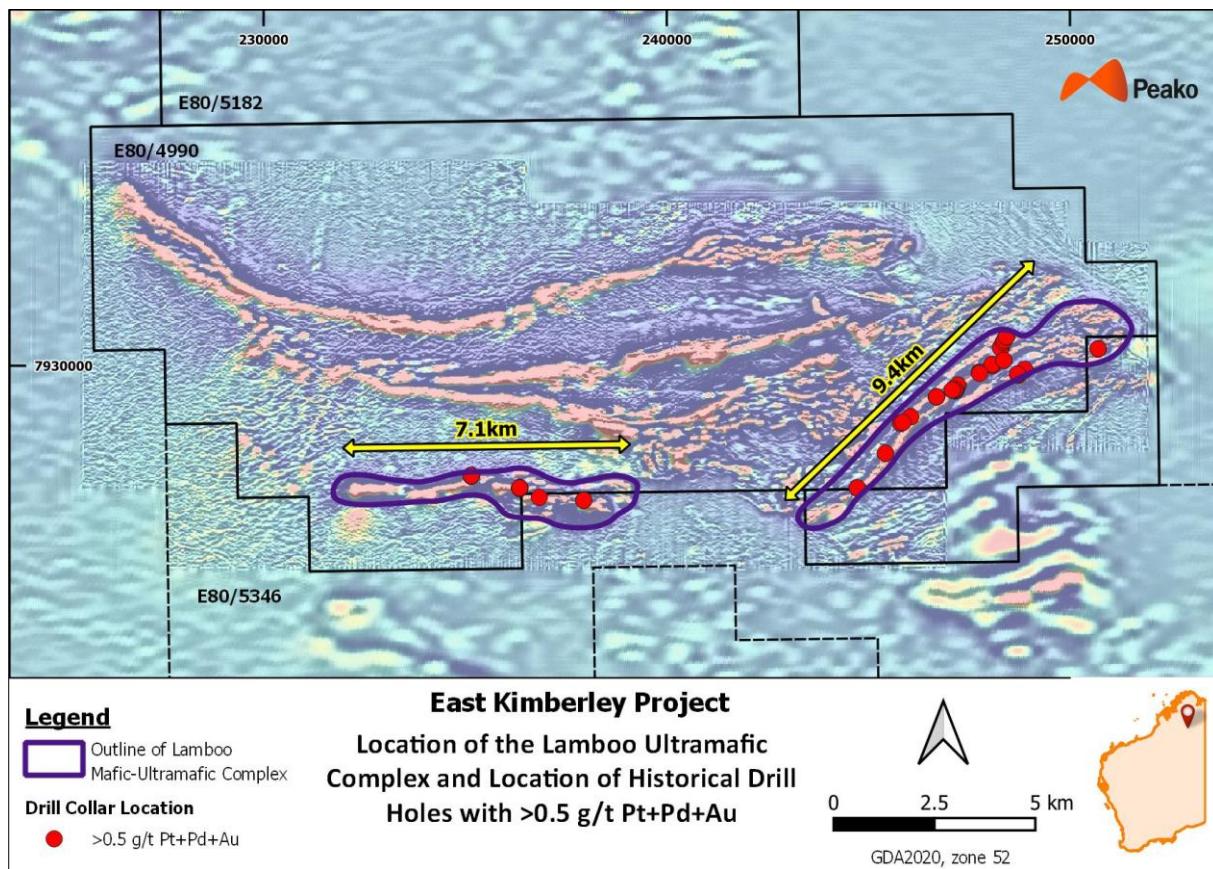

Figure 1: Outline of the Lamboo Ultramafic Complex over 1VD Aeromagnetic Image. Includes collar locations for historical holes that returned intercepts >0.5 g/t Pt+Pd+Au.

Peako Limited (ASX: PKO, Peako) is pleased to advise that its recent review of the Lamboo Ultramafic Intrusives has identified the potential for a significant platinum group element (PGE) mineralised system within its Eastman Tenement.

Peako's Eastman Tenement (E80/4990) hosts a diverse suite of Proterozoic rocks that include the Koongie Park Formation Volcanic Belt and the Lamboo Ultramafic Intrusive Belt as well as an array of granitoid intrusions. Although the potential of the Lamboo Ultramafic Belt to host PGEs plus Nickel and Copper mineralisation has been recognised by previous explorers, most prior exploration focused on the base metal potential of the Koongie Park Formation.

Encouraged by recent reporting of wide intercepts of PGEs plus gold mineralisation at Pantoro Limited's nearby Halls Creek Project, Peako commenced a prospectivity review of the Lamboo Ultramafic intrusions within its Eastman Tenement. Peako considers that the exploration model for the Lamboo Ultramafics validated by Pantoro at its Halls Creek Project presents a new and compelling exploration target for the Eastman tenement.

Geology

Peako's Eastman Tenement hosts extensive Lamboo Ultramafic Intrusions which aeromagnetic and satellite imagery suggest extends for an aggregate 16.5 km within the tenement. The ultramafic complex is relatively well exposed in the east of the tenement, the central portion has been stoped out by the Eastman Granite and the western portion extends beneath shallow cover, but is clearly visible in the geophysics (Figure 1).

The Lamboo Ultramafic Complex is a layered mafic to ultramafic intrusive complex comprised predominately of pyroxenite, anorthosite and gabbro. The pyroxenite forms the basal unit to the overlying gabbro and anorthosite. The basal pyroxenite zone hosts the PGE mineralisation, often within numerous chromite seams and lenses. The sequence has been variably folded and faulted in places resulting in structural repetition of the sequence. Multiple structural repeats of the sequence adds considerably to the prospectivity of the Lamboo Ultramafic Intrusives on the Eastman Tenement.

Previous Exploration

Previous exploration of the Lamboo Ultramafic Intrusives within the Eastman Tenement has been limited, and concentrated on the relatively short and discontinuous chromite lenses within the pyroxenite layers, rather than the more continuous and wider pyroxenite layers themselves. Mapping programs by previous explorers identified many chromite lenses within the basal unit, and it is these lenses that were the main target for historical drill testing.

Widespread anomalous PGE intercepts from sparse, wide-spaced historical drilling over the 16.5km extent of the Lamboo Ultramafic Complex indicate an extensive PGE mineralised system (refer Figure 2). Anomalous historical interceptions include,

- **18m @ 1.42 g/t Pt+Pd+Au from 32m**
- 20m @ 0.84 g/t Pt+Pd+Au (3E) from 9m, incl. **10m @ 1.26 g/t Pt+Pd+Au (3E) from 9m**
- 30m @ 0.47 g/t Pt+Pd+Au (3E) from 77m
- 20m @ 0.48 g/t Pt+Pd+Au (3E) from 131m
- 19m @ 0.47 g/t Pt+Pd+Au (3E) from 86m
- 8m @ 0.81 g/t Pt+Pd+Au (3E) from 19m
- 6m @ 0.86 g/t Pt+Pd+Au (3E) from 105m
- 7m @ 0.65 g/t Pt+Pd+Au (3E) from 40m

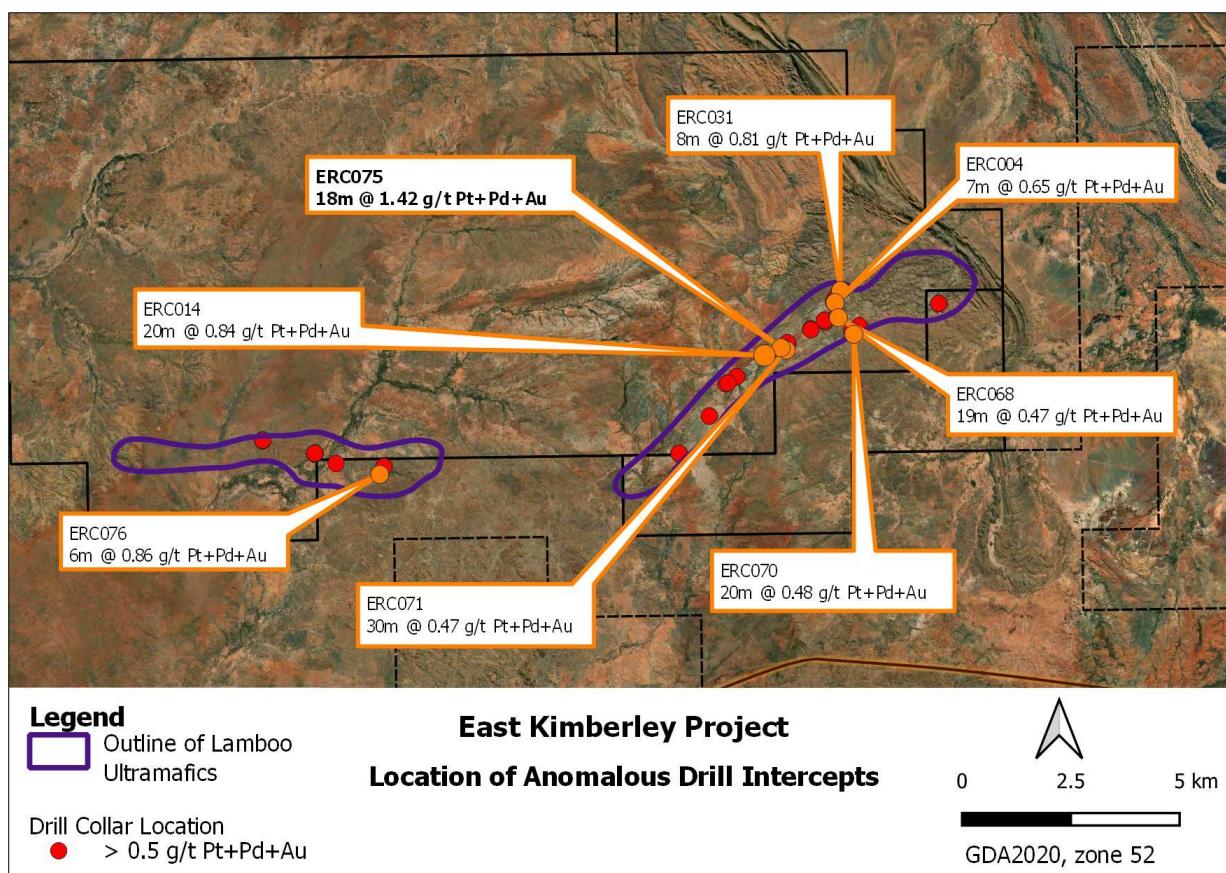

Figure 2: Location of historical drill holes with intercepts greater than 0.5 g/t Pt+Pd+Au and some of the more significant historical PGE intersections while drill targeting for chromite.

New Exploration Model

At its Halls Creek Project located approximately 75 km north-east of Peako's Eastman Tenement, Pantoro Limited has reported wide intercepts of PGE plus gold mineralisation from recent drilling. Results have included,

- 31m @ 2.42 g/t Pt+Pd+Au (3E) from surface¹
- 38m @ 2.34 g/t Pt+Pd+Au (3E) from 1m¹
- 34m @ 2.02 g/t Pt+Pd+Au (3E) from surface¹
- 136m @ 0.93 g/t Pt+Pd+Au (3E) from 44m¹
- 100m @ 1.10 g/t Pt+Pd+Au (3E) from surface, inc. 66m @ 1.34 g/t Pt+Pd+Au (3E) from surface²
- 120m @ 0.96 g/t Pt+Pd+Au (3E) from surface, inc. 31m @ 1.24 g/t Pt+Pd+Au (3E) from 89m.²

Significantly, Pantoro has targeted the PGE potential of the pyroxenite layer at the base of the Lamboo Ultramafic rather than solely the chromite lenses within the pyroxenite. This strategy has proved to be successful, resulting in the wide mineralised intercepts reported.

Peako's Eastman Tenement is located on the same Palaeoproterozoic rocks of the Halls Creek Orogeny as Pantoro's Halls Creek Project and, importantly, the geology of the Lamboo Ultramafic Complex appears similar in both project areas. Pantoro's exploration model therefore presents a new exploration target at the Eastman Tenement as previous explorers had focused on the discontinuous chromite lenses rather than targeting the wider more extensive PGE-rich basal pyroxenite zone.

Given the new interpretation, the Lamboo Ultramafics will be a significant focus for Peako's 2022 field activities. The ongoing compilation and interpretation of historical data will underpin the design of drill targets. A program of surface sampling and field mapping early in the field season will be used to refine targeting and develop additional drill targets with drill testing of targets planned for the second half of the field season.

¹ "Wide Drill Intersections from Surface Confirm Major PGE System at Halls Creek", Pantoro Limited (ASX:PNR), 6 September 2021 https://cdn-api.markitdigital.com/apiman-gateway/ASX/asx-research/1.0/file/2924-02417842-6A1048986?access_token=83ff96335c2d45a094df02a206a39ff4

² "Drilling Confirms Large Scale Lamboo PGE Deposit", Pantoro Limited (ASX:PNR), 15 November 2021 https://cdn-api.markitdigital.com/apiman-gateway/ASX/asx-research/1.0/file/2924-02451897-6A1062623?access_token=83ff96335c2d45a094df02a206a39ff4

Summary

Peako is highly encouraged by the potential for a large PGE mineralised system within the Eastman Tenement. Historical exploration confirms the basal pyroxenite hosts anomalous PGE (\pm gold) mineralisation over much of its 16.5 kilometre strike length. In addition to this, multiple layers of the target horizon are present on the tenement due to the sequence being repeated by folding and faulting. Peako believes previous exploration has not adequately evaluated the PGE potential of the area with previous workers having concentrated on the relatively short and discontinuous chromite lenses rather than the more continuous, wider PGE-rich pyroxenite layers.

Competent Person Declaration

The information in this report that relates to Exploration Results is based on information compiled or reviewed by Dr Paul Kitto who is a member of the Australian Institute of Geoscientists. Dr Kitto is Technical Director of and a consultant to Peako Limited and has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Dr Kitto consents to the inclusion in this report of the matters based on information provided by him and in the form and context in which it appears.

Appendix B: JORC Code (2012 Edition), Assessment and Reporting Criteria

Section 1: Sampling Techniques and Data

Criteria	JORC Code Explanation	Explanation
Sampling Techniques	<i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</i>	The sampling described in this report refers to historical drilling by Navigator Resources Limited and Magma Metals Limited. An RC drilling program was undertaken by Navigator Resources in 2004 and Magma Metals Limited 2008. Results and information from this drilling has been sourced from open file reports available within the Western Australia Minerals Exploration database, specifically report with reference numbers A68201 and A80967
	<i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i>	Information not available
	<i>Aspects of the determination of mineralisation that are Material to the Public Report.</i>	<i>All Navigator samples were analysed by GENALYSIS. All 5m composite samples were analysed with aqua regia digest with an AAS finish. Anomalous 1m resplit samples were analysed by fire assay and a 25g charge.</i> <i>Magma Metals sent sample to ALS Chemex in Perth for analysis. Method PGM-MS23 was used to assay Au, Pt and Pd. This method is a fire assay on a 30g charge followed by ICP-MS finish. All other elements were analysed with method ME-ICP1, which involved an acid digest with an ICP-AES finish.</i>
Drilling Techniques	<i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</i>	Both Navigator Resources and Magma Metals drilled the using Reverse Circulation (RC) drilling. Hole dimensions not known.
Drill sample recovery	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i>	Information not available
	<i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i>	Information not available

Criteria	JORC Code Explanation	Explanation
	<i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	Information not available
Logging	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i>	All holes were geologically logged based on visual observation.
	<i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i>	RC chip logging are both qualitative and quantitative, depending on the field being logged.
	<i>The total length and percentage of the relevant intersections logged.</i>	All RC appears to have been logged.
Sub-sampling techniques and sample preparation	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	No drill core is described in this report.
	<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i>	Navigator Resources – Was not detailed in reports Magma Metals – Samples were collected at 1m intervals and split with either a rotary splitter or a three tier riffle splitter.
	<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	Information not available, but methods described follow industry best practice.
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	Information not available
	<i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i>	Information not available
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	Information not available
Quality of assay data and laboratory tests	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i>	The methods and techniques described in reporting are appropriate for material drilled. Certified commercial laboratories were used and all assaying and laboratory procedures are consistent with industry standards.

Criteria	JORC Code Explanation	Explanation
	<i>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i>	NA
	<i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i>	NA
Verification of sampling and assaying	<i>The verification of significant intersections by either independent or alternative company personnel.</i>	Reported results are compiled from open file WAMEX reports by the Company's Senior Geologist and Competent Person
	<i>The use of twinned holes.</i>	No twinned holes are reported in this release.
	<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i>	NA
	<i>Discuss any adjustment to assay data.</i>	There were no adjustments to the assay data.
Location of data points	<i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i>	<u>Historical RC Drilling</u> NA
	<i>Specification of the grid system used.</i>	Location data was collected in WGS84, z52 and GDA1994, Z52 and have been converted to GDA2020, MGA Zone 52.
	<i>Quality and adequacy of topographic control.</i>	NA
Data spacing and distribution	<i>Data spacing for reporting of Exploration Results.</i>	Drillhole spacing is appropriate for first pass drill testing
	<i>Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i>	Drilling are not being used for Mineral Resource estimation.
	<i>Whether sample compositing has been applied.</i>	Navigator Resources composited samples to 5m composites. Anomalous results were re-analysed as 1m splits. Magma Metals did not composite.

Criteria	JORC Code Explanation	Explanation
Orientation of data in relation to geological structure	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i>	NA
	<i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	No orientation-based sampling bias has been identified in the data at this point.
Sample security	<i>The measures taken to ensure sample security.</i>	NA
Audits or reviews	<i>The results of any audits or reviews of sampling techniques and data.</i>	There has been no external audit or review of the Company's techniques or data and Peako has not carried out any audits or reviews of the historical sampling techniques.

Section 2: Reporting of Exploration Results

Criteria	JORC Code explanation	Explanation
Mineral tenement and land tenure status	<i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i>	Results reported in this announcement are from currently granted Exploration Licence E80/4990, in which Peako's wholly owned subsidiary SA Drilling Pty Ltd has a 100% interest. The tenement is situated within the Gooniyandi Combined #2 Native Title Claim (WC 2000/010) and Determination (WCD2013/003).
	<i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	The tenement is current and in good standing with all statutory commitments being met as and when required. There are no known impediments to obtaining a licence to operate pending the normal approvals process.
Exploration done by other parties	<i>Acknowledgment and appraisal of exploration by other parties.</i>	Historical exploration within the tenement area has been undertaken by numerous parties, commencing with Pickands Mather in 1967. Refer Peako Limited ASX release dated 15 August 2018, Appendix 3 and 28 November 2019, Appendix C for overview of exploration historically undertaken on the tenement.
Geology	<i>Deposit type, geological setting and style of mineralisation.</i>	The tenements host a diverse Paleoproterozoic succession that is widely

Criteria	JORC Code explanation	Explanation
		<p>intruded by multiple granitoid phases and deformed by multiple orogenic episodes.</p> <p>The morphology of the mineralisation as well as the structural make up is not well understood.</p> <p>The area represents the western-most window of the Halls Creek Orogen where volcanic successions of the bimodal Koongie Park Formation volcanic belt (c.1845 Ma) and the Lamboo Ultramafic (LUM) intrusive belt (c.1850-1835 Ma) are well developed.</p> <p>Satellite imagery and rock geochemistry define an array of multistage, poorly constrained granitoid intrusions across the tenement, with compositions that include granite, granodiorite, diorite, monzogranite and granophyre.</p> <p>The geological diversity within the tenements has driven the search for a wide range of commodities by present and past explorers. The Koongie Park Formation (KPF) has demonstrated prospectivity for base (Cu-Pb-Zn) and precious (Ag, Au) metals with postulated mineralisation styles varying from VHMS to SVAL-hybrid styles, to epithermal and skarnoid mineralisation associated with widespread carbonate facies in the KPF stratigraphy.</p> <p>In addition, mafic to ultramafic intrusions of the Lamboo Ultramafic complex have demonstrated prospectivity for base metal (Ni, Cu) and precious (Au, PGE) metals with potential mineralisation styles varying across magmatic, cumulate to intrusion or orogenic-related gold associated with deep crustal-tapping fertile structures.</p>
Drill hole Information	<p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <ul style="list-style-type: none"> • <i>easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> • <i>dip and azimuth of the hole</i> • <i>down hole length and interception depth</i> • <i>hole length.</i> 	See Appendix A, Table 1

Criteria	JORC Code explanation	Explanation
	<i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i>	There has been no exclusion of information
Data aggregation methods	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i>	No cutting of grade or compositing of samples was described
	<i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i>	Not applicable to this document.
	<i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>	Metal equivalent values are not reported in this announcement.
Relationship between mineralisation widths and intercept lengths	<i>These relationships are particularly important in the reporting of Exploration Results.</i>	Insufficient geological data has been collected to confirm the geometry or true width of mineralisation.
	<i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i>	Not applicable to this document.
	<i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i>	Not applicable to this document.
Diagrams	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	
Balanced reporting	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	Because it was not practicable to list all assay results for drill holes cited, only mineralised sections of holes have been reported in Appendix A, Table 2.

Criteria	JORC Code explanation	Explanation
Other substantive exploration data	<p><i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i></p>	<p>There is no other exploration data which is considered material to the results reported in the announcement.</p>
Further work	<p><i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></p>	<p>Planned further work includes follow up field mapping, rock chip and soil sampling in addition to a full review of the Lamboo Ultramafic Belt with the aim of designing a drill program to be drilled in the second half of the 2022 field season.</p>
	<p><i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i></p>	<p>Refer to main body of this report.</p>
