

## ASX ANNOUNCEMENT

Heavy Rare Earths Limited (ASX:HRE)  
4 October 2022

# COWALINYA RE-ASSAY PROGRAM DELIVERING RARE EARTH GRADE INCREASE

- **Re-assaying of samples above the Cowalinya resource cut-off grade delivers an average increase of 14.8% in total rare earths**

Heavy Rare Earths Limited (“HRE” or “the Company”) is pleased to report results from 67 of 729 re-assayed two-metre composite samples from 102 air core holes drilled at its Cowalinya rare earth project in 2021, **which show a 14.8% length-weighted average increase in total rare earth oxides (“TREO”)**.

The samples being re-assayed were the basis of HRE’s maiden mineral resource at the Cowalinya project in the Norseman-Esperance region of Western Australia. Inferred Resources totalling 28 million tonnes @ 625 ppm TREO have been estimated in clay-rich saprolite.<sup>1</sup> Mineralisation is relatively flat-lying, averages 8-9 metres thick, and remains open in all lateral directions.

Assays reported in this announcement are the first from HRE’s Analytical (Re-Assay) Program (*refer to ASX announcement 30 August 2022*). The 67 two-metre composites from 16 mineralised holes drilled mainly in the southern part of the Cowalinya South resource (Figure 1) correspond to 43 four-and two-metre composites that were originally assayed by 4-Acid Digest/ICP-MS (‘near total digest’) by LabWest Minerals Analysis (“LabWest”) in 2021. These 43 original composites reported values above the 300ppm TREO-CeO<sub>2</sub> cut-off used in estimating resources at Cowalinya. LabWest has now assayed the 67 new two-metre composites using Lithium Borate Fusion/ICP-MS (‘total digest’) and this allows for a direct comparison with the original 4-Acid Digest assays.

Assays from these 67 samples show that the dual strategy of analysis by Lithium Borate Fusion/ICP-MS and adopting finer compositing of samples delivers a length-weighted average increase of 14.8% in TREO grade for samples where the original analytical work by 4-Acid Digest/ICP-MS returned assays above 300ppm TREO-CeO<sub>2</sub>. See Table 1 for comparison of results.

These initial positive results are consistent with HRE’s earlier assay comparison work (12.2% average increase in TREO grade)<sup>2</sup> and further support routine two-metre sample compositing by HRE for assay by Lithium Borate Fusion/ICP-MS as the basis for future grade estimation of rare earth mineralisation from its resource exploration and expansion program at Cowalinya.

The Company will announce further results on completion of the Analytical (Re-Assay) Program.

-- Ends --

**About Heavy Rare Earths Limited**

Heavy Rare Earths Limited (ASX:HRE) is an Australian rare earth exploration and development company. HRE's key exploration project is Cowalinya, near Norseman in Western Australia. This is a clay-hosted rare earth project with a JORC Inferred Resource of 28Mt @ 625ppm TREO and a desirable rare earth composition where 25% are the valuable magnet rare earths and 23% the strategic heavy rare earths.

**Competent Persons Statement**

The Exploration Results contained in this announcement were compiled by Mr. Richard Brescianini. Mr. Brescianini is a member of the Australian Institute of Geoscientists (AIG). He is a director and full-time employee of Heavy Rare Earths Limited. Mr. Brescianini has more than 35 years' experience in mineral exploration and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration to qualify as a Competent Person as defined in the 2012 JORC Code.

The Mineral Resources contained in this announcement have been extracted from the Independent Geologist's Report included in the Company's Initial Public Offering (IPO) Prospectus, a copy of which was lodged with the Australian Securities and Investments Commission (ASIC) on 5 July 2022. The Company confirms that it is not aware of any new information or data that materially affects the Mineral Resources as contained in the Company's IPO Prospectus. All material assumptions and technical parameters underpinning the Mineral Resources in the Company's IPO Prospectus continue to apply and have not materially changed.

**Figure 1: Plan view of Cowalinya deposit air core drilling.**  
**Drill holes from which re-assays are reported in Table 1 are shown in yellow.**

**Table 1: Summary of results from Cowalinya Analytical (Re-Assay) Program.**  
**Assay comparisons are presented for composite samples that originally returned  $\geq 300$ ppm TREO-CeO<sub>2</sub> by 4-Acid Digest/ICP-MS.**

## 2012 JORC Code – Table 1

### Section 1: Sampling Techniques and Data

|                            |                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Sampling techniques</b> | Nature and quality of sampling (e.g., cut channels, random chips, or specific specialized industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. | <p>A total of 109 vertical aircore holes were drilled in two areas at Cowalinya in July 2021 – 59 holes in Cowalinya South and 50 holes in Cowalinya North. Maximum hole depth was 44m. All holes were testing for supergene rare earth element (REE) mineralisation hosted by saprolitic clays. Both areas drilled overlapped extensively with areas previously aircore drilled by two other companies exploring for gold (AngloGold Ashanti Ltd and Great Southern Gold Pty Ltd).</p> <p>One-metre samples were collected from a cyclone into plastic bags.</p> <p>In the original program, 100 holes were 4m composite sampled with shorter composites at end of hole; 9 holes were sampled on a 1m basis. Overlying transported sediments were not routinely sampled as they were not thought to contain anomalous amounts of REEs – where they were assayed low values were returned.</p> <p>In the re-assay program, 102 of the original 109 holes drilled were sampled on a 2m basis.</p> |
|                            | Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.                                                                                                                                                                                    | For aircore drilling, regular air and manual cleaning of cyclone was undertaken. Certified standards and duplicate samples were submitted with drill samples.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                            | Aspects of the determination of mineralisation that are Material to the Public Report.                                                                                                                                                                                                                                           | Aircore drilling was used to obtain 1m samples which were collected in plastic bags. Samples ranging from 1m to 4m composites (original program) and 2m composites (re-assay program) were taken for analysis. Sample size was 2-3kg in weight. At LabWest Minerals Analysis (LabWest) in Perth, Western Australia, samples were dried, crushed, split and pulverized with a 0.1g sub-sample set aside for assay.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Drilling techniques</b> | Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g., core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).                                      | Aircore. A type of reverse circulation drilling using slim rods and a 3.5-inch blade bit. The samples recovered are typically rock chips and powder, similar to reverse circulation drilling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                                       |                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Drill sample recovery</b>                          | Method of recording and assessing core and chip sample recoveries and results assessed.                                                                                                           | Aircore recovery was visually assessed by comparing drill chip volumes in sample bags for individual metres. Estimates of sample recovery were recorded on drill logs. Routine checks for correct sample depths were undertaken. Aircore sample recoveries were visually checked for recovery, moisture and contamination and considered to be acceptable within industry standards. The cyclone was routinely cleaned ensuring no material build up.                        |
|                                                       | Measures taken to maximize sample recovery and ensure representative nature of the samples.                                                                                                       | Due to the generally good drilling conditions through dry saprolite the responsible geologist believes the samples are reasonably representative. Poor sample recovery was regularly recorded in the first couple of metres of a hole and often when hard bedrock was intersected – usually less than a full metre was recovered. Wet samples with moderate recoveries were encountered most often in the transported sand/silcrete layer lying immediately above saprolite. |
|                                                       | Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.                                  | No sample bias has been identified to date. Future studies will be undertaken.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Logging</b>                                        | Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. | Chip/clay samples were geologically logged in enough detail to discern lithological units. Logging was appropriate for this style of drilling and current stage of the project.                                                                                                                                                                                                                                                                                              |
|                                                       | Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.                                                                                           | Logging was qualitative in nature.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                                       | The total length and percentage of the relevant intersections logged.                                                                                                                             | All aircore holes were completely geologically logged.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Sub-sampling techniques and sample preparation</b> | If core, whether cut or sawn and whether quarter, half or all core taken.                                                                                                                         | Not applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                                                       | If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.                                                                                                    | 1m samples were collected from a cyclone into plastic bags. 4m and 2m composites and single metre samples were collected by spearing each plastic bag with a scoop down the side of the bag and dragging it back up the side of the bag so as not to lose any sample – this achieved a representative sample from top to bottom through the entire bag. The vast majority of samples were dry sampled.                                                                       |
|                                                       | For all sample types, the nature, quality and appropriateness of the sample preparation technique.                                                                                                | Sampling technique is appropriate for the sample types and stage of the project.                                                                                                                                                                                                                                                                                                                                                                                             |
|                                                       | Quality control procedures adopted for all sub-sampling stages to maximize representivity of samples.                                                                                             | QAQC procedures involved the use of certified standards every 40 <sup>th</sup> sample in the original program, and every 20 <sup>th</sup> sample in the re-assay program.                                                                                                                                                                                                                                                                                                    |

|                                                   |                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                              | Nature of quality control procedures adopted (e.g., standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e., lack of bias) and precision have been established. | <p>OREAS standards and/or blanks were inserted every 40<sup>th</sup> sample in the field in the original program, and every 20<sup>th</sup> sample in the re-assay program. Field duplicates were taken every 80<sup>th</sup> sample in the original program, and every 20<sup>th</sup> sample in the re-assay program.</p> <p>LabWest used OREAS standards, blanks and sample repeats. Acceptable levels of accuracy were achieved.</p> <p>In the original program, Bureau Veritas conducted check assays by lithium borate fusion/laser ablation/ICP-MS on 46 samples containing &gt;300ppm total rare earth oxide (TREO) from Cowalinya South – these on average gave 12.2% higher TREO values than the original HF/multi-acid digests by LabWest reflecting 'total' digest by the fusion method as opposed to 'near total' digest by the multi-acid method. Correlation coefficient between the two methods was 0.985.</p> <p>The Bureau Veritas work provided the technical justification to proceed with the re-assay program.</p> |
| <b>Verification of sampling and assaying</b> | The verification of significant intersections by either independent or alternative company personnel.                                                                                                              | Significant intersections have yet to be verified by an independent geological consultant. They have been verified by alternative company geological personnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                              | The use of twinned holes.                                                                                                                                                                                          | Three aircore holes were drilled close enough to historical aircore holes to be able to compare downhole La and Ce assays. The distribution profiles and values were similar for two of the holes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                                              | Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.                                                                                         | All data have been entered into Excel spreadsheets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                                                                | Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. | Data spacing sufficient for this style of mineralisation to establish an Inferred Mineral Resource at both Cowalinya North and South. The mineralisation occurs as extensive, generally flat lying supergene blankets hosted in saprolitic clays.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                                                                | Whether sample compositing has been applied.                                                                                                                                                                                 | In the original program, 100 holes out of 109 were assayed by 4m composite samples, compiled from one metre drilled samples. 2m and 3m composites were sometimes created at the end of a hole depending on the final depth. The remaining 9 holes were sampled on a 1m basis. This resulted in a total of 859 samples (including standards, blanks and field duplicates) being submitted for assay.<br><br>In the re-assay program, 102 holes out of 109 were assayed by 2m composite samples, resulting in a total of 729 samples (including standards, blanks and field duplicates). Sampling targeted mineralised drill intervals from the original program that assayed $\geq 200$ ppm TREO. |
| <b>Orientation of data in relation to geological structure</b> | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.                                                                   | Sampling is likely to be unbiased as vertical holes are intersecting flat lying mineralisation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                                                | If the relationship between the drilling orientation and the orientation of key mineralized structures is considered to have introduced a sampling bias, this should be assessed and reported if material.                   | It is unlikely to be biased.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Sample security</b>                                         | The measures taken to ensure sample security.                                                                                                                                                                                | The Competent Person undertook the sampling and delivery of samples to the laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Audits or reviews</b>                                       | The results of any audits or reviews of sampling techniques and data.                                                                                                                                                        | No audits or reviews have been commissioned to date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Section 2: Reporting of Exploration Results

|                                                |                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mineral tenement and land tenure status</b> | Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.                                                                                                                                | Exploration licence E63/1972 is located 55 km east-north-east of Salmon Gums, Western Australia. It consists of 80 graticular blocks comprising an area of 224 km <sup>2</sup> . It is situated on unallocated crown land. The registered holder is Heavy Rare Earths Limited (HRE). Mr. David Ross was the responsible geologist who supervised the drilling and undertook the sampling.<br><br>Full native title rights have been granted over the tenement and surrounding lands to the Ngadju people.                                      |
|                                                | The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.                                                                                                                                                                                                                                                                    | The tenement is in good standing. There are no impediments to operating on the tenement other than requirements of the DMIRS and the Heritage Protection Agreement, all of which are industry standard.                                                                                                                                                                                                                                                                                                                                        |
| <b>Exploration done by other parties</b>       | Acknowledgment and appraisal of exploration by other parties.                                                                                                                                                                                                                                                                                                                                               | AngloGold Ashanti and Great Southern Gold both previously worked in the area of E63/1972 exploring for gold mineralisation. Surface geochemical sampling and aircore drilling was undertaken by both companies but no significant gold mineralisation was discovered. Both companies assayed bottom of hole samples for a suite of multi-elements including REEs. Anomalous bedrock REE values were recorded in numerous holes from their drilling. Great Southern Gold also assayed for La and Ce for the entire length of a number of holes. |
| <b>Geology</b>                                 | Deposit type, geological setting and style of mineralisation.                                                                                                                                                                                                                                                                                                                                               | The deposit type being investigated is low grade saprolite clay-hosted supergene rare earth mineralisation. This style of supergene rare earth mineralisation is developed over bedrock granitic rock types (granites and granitic gneisses) which contain anomalous levels of REEs. Although low grade, low mining and processing costs can make this type of deposit profitable to exploit.                                                                                                                                                  |
| <b>Drillhole Information</b>                   | A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drillholes:<br>easting and northing of the drillhole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drillhole collar<br>dip and azimuth of the hole down hole length and interception depth<br>hole length. | All relevant data for the drilling is shown in Table 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                                                                         |                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                                           |                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Diagrams</b>                           | Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drillhole collar locations and appropriate sectional views.                                                                                                                     | Refer to Figure 1 for a plan view of the Cowalinya drillhole collar locations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Balanced reporting</b>                 | Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.                                                                                                                                                             | Re-assays of intersections of mineralised widths ( $\geq 300$ ppm TREO-CeO <sub>2</sub> ) for which a direct comparison with assays from the original program is possible, are reported in Table 1.<br><br>Complete assays for these intervals are presented in Table 3.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Other substantive exploration data</b> | Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. | Preliminary metallurgical testwork has shown up to 91% TREO recovery from Cowalinya South using 5% hydrochloric acid at 30°C.<br><br>U and Th values are reported in the re-assay program as they are considered to be deleterious elements in rare earth processing. The highest values recorded for these elements in the original program were 48ppm U <sub>3</sub> O <sub>8</sub> and 48ppm ThO <sub>2</sub> and 12ppm U <sub>3</sub> O <sub>8</sub> and 45ppm ThO <sub>2</sub> in the re-assay program. Weighted averages for all intersections reporting $\geq 300$ ppm TREO-CeO <sub>2</sub> in the original program were 5ppm U <sub>3</sub> O <sub>8</sub> and 15ppm ThO <sub>2</sub> . |
| <b>Further work</b>                       | The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling).                                                                                                                                                                                                                                               | Further aircore drilling is in progress to test for lateral extensions to mineralisation.<br><br>Comprehensive metallurgical testwork is in progress and petrological studies will be completed to identify REE-bearing mineral species.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                           | Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.                                                                                                                                                                                     | HRE deems this to be commercially sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
