

**DIMERIX PRESENTS AT
EUROZ HARTLEY HEALTHCARE FORUM**

MELBOURNE, Australia, 04 February 2025: Dimerix Limited (ASX: DXB), a biopharmaceutical company with a Phase 3 clinical asset in kidney disease, is pleased to advise that CEO and Managing Director, Dr Nina Webster, will be presenting at the Euroz Hartley Healthcare Forum in Perth, WA on 04 February 2025.

A copy of the presentation is attached.

About Dimerix

Dimerix (ASX: DXB) is a clinical-stage biopharmaceutical company working to improve the lives of patients with inflammatory diseases, including kidney diseases. Dimerix is currently focussed on developing its proprietary Phase 3 product candidate DMX-200 (QYTOVRA® in some territories), for Focal Segmental Glomerulosclerosis (FSGS) kidney disease, and is also developing DMX-700 for respiratory disease. DMX-200 and DMX-700 were both identified using Dimerix' proprietary assay, Receptor Heteromer Investigation Technology (Receptor-HIT), which is a scalable and globally applicable technology platform enabling the understanding of receptor interactions to rapidly screen and identify new drug opportunities.

About DMX 200

DMX 200 is the adjunct therapy of a chemokine receptor (CCR2) antagonist administered to patients already receiving an angiotensin II type I receptor (AT1R) blocker - the standard of care treatment for hypertension and kidney disease. DMX 200 is protected by granted patents in various territories until 2032, with patent applications submitted globally that may extend patent protection to 2042, in addition to any exclusivity period that may apply in key territories. In 2020, Dimerix completed two Phase 2 studies: one in FSGS and one in diabetic kidney disease, following a successful Phase 2a trial in patients with a range of chronic kidney diseases in 2017. No significant adverse safety events were reported in any trial, and all studies resulted in encouraging data that could provide meaningful clinical outcomes for patients with kidney disease.

About FSGS

FSGS is a rare disease that attacks the kidney's filtering units, where blood is cleaned (called the 'glomeruli'), causing irreversible scarring. This leads to permanent kidney damage and eventual end-stage failure of the organ, requiring dialysis or transplantation. For those diagnosed with FSGS the prognosis is not good. The average time from a diagnosis of FSGS to the onset of complete kidney failure is only five years and it affects both adults and children as young as two years old.¹ For those who are fortunate enough to receive a kidney transplant, approximately 60% will get re-occurring FSGS in the transplanted kidney.² At this time, there are no drugs specifically approved for FSGS anywhere in the world, so the treatment options and prognosis are limited. FSGS is a billion-dollar plus market: the number of people with FSGS in the US alone is just over 80,000,¹ and worldwide about 220,000.³ The illness has a global compound annual growth rate of 8%, with over 5,400 new cases diagnosed in the US alone each year.⁴ Because there is no effective treatment, Dimerix has received Orphan Drug Designation for DMX 200 in both the US and Europe for FSGS. Orphan Drug Designation is granted to support the development of products for rare diseases and qualifies Dimerix for various development incentives including: seven years (FDA) and ten years (EMA) of market exclusivity if regulatory approval is received, exemption from certain application fees, and a fast-tracked regulatory pathway to approval. Dimerix reported positive Phase 2a data in FSGS patients in July 2020.

Forward looking statements

This presentation includes forward-looking statements that are subject to risks and uncertainties. Such statements involve known and unknown risks and important factors that may cause the actual results, performance or achievements of Dimerix to be materially different from the statements in this presentation.

Actual results could differ materially depending on factors such as the availability of resources, the results of clinical studies, the timing and effects of regulatory actions, the strength of competition, the outcome of legal proceedings and the effectiveness of patent protection.

Overview | Phase 3 Global Opportunity

Lead Drug Candidate

- DMX-200 is currently in a **Phase 3 clinical trial** for focal segmental glomerulosclerosis (FSGS)
- DMX-200 has **orphan drug designation** in key territories

FSGS Indication

- FSGS is a **rare disease** that causes scar tissue of kidneys, which leads to irreversible kidney damage¹
- FSGS kidney damage can lead to dialysis, kidney transplants or death¹
- There are currently **no approved treatments** available to treat FSGS

Commercial and Technical Validation

- **Three commercial licensing deals** achieved:
 - ~\$458m in total upfront & potential milestone payments + royalties²
- **Successful Phase 3 interim analysis**: Analysis showed DMX-200 had performed better than placebo in reducing proteinuria³

1. Guruswamy Sangameswaran KD, Baradhi KM. Focal Segmental Glomerulosclerosis (July 2021), online: <https://www.ncbi.nlm.nih.gov/books/NBK532272/>; 2. ASX release 05 October 2023, 27 May 2024 and 07 January 2025; 3. Predictive Power statistical model, using industry standard as set by the independent renal biostatistician consultant for Dimerix, ASX release 11 March 2024

Focal Segmental Glomerulosclerosis (FSGS)

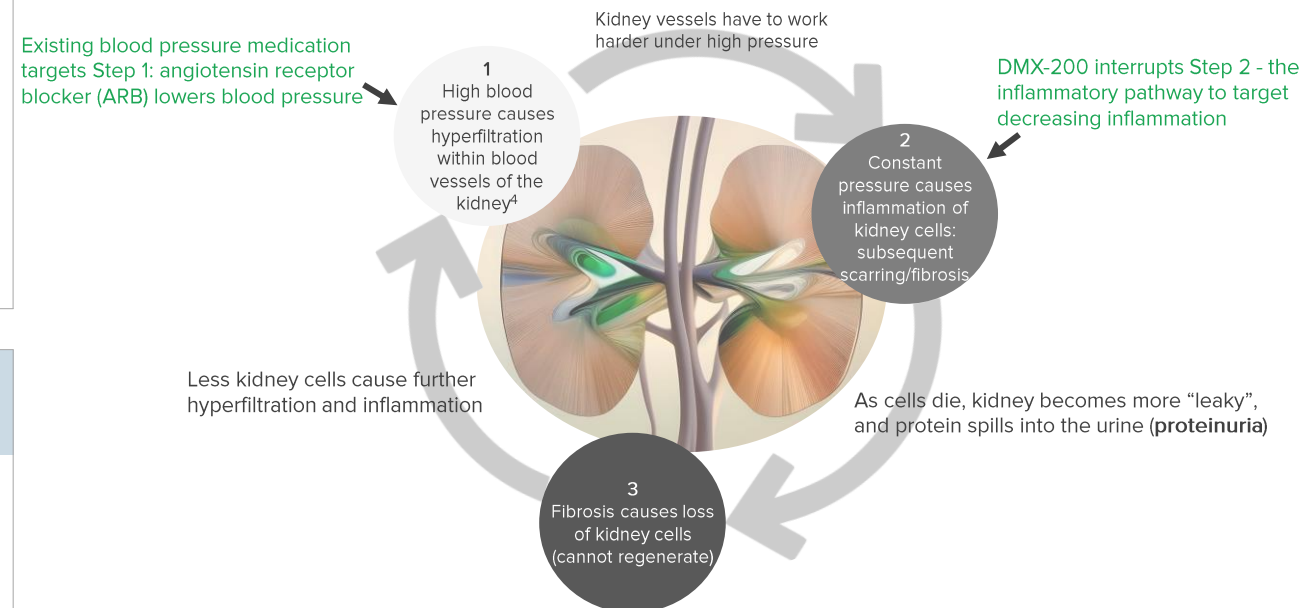

What is FSGS?

Focal	= some
Segmental	= sections
Glomerulo	= of the kidney filtering units
Sclerosis	= are scarred

How do you measure kidney function?

- Historically, measured using “hard” endpoints for kidney disease (kidney failure) -which may not be reached for decades¹
- Regulatory agencies and national bodies now consider estimated glomerular filtration rate (eGFR) and proteinuria decline as surrogate end points for kidney failure in certain conditions²

FSGS Kidney Damage³

Significance of decreasing proteinuria: primary endpoint

Why are kidneys important?

- A healthy kidney is a good filter and allows little to no protein in the urine¹

- When kidneys are damaged, protein can leak into the urine causing proteinuria
- Proteinuria represents an important early marker of kidney function²

Symptoms of proteinuria

	More frequent urination		Shortness of breath
	Nausea and vomiting		Tiredness
	Swelling in the face, stomach, feet and/or ankles		Lack of appetite
	Muscle cramping at night		Foamy or bubbly urine
	Puffiness around the eyes, especially in the morning		

DMX-200 aims to reduce the inflammation of the kidneys:

- if DMX-200 reduces inflammation, the amount of proteinuria should decrease

Significance of stabilising eGFR curve: primary endpoint

★ Assumes diagnosis occurs well into disease and treatment started immediately

- Kidney function can be measured using estimated glomerular filtration rate (eGFR):
 - how many millilitres of blood is filtered by the kidney per minute
- eGFR slope naturally declines as we age¹
- In FSGS patients, it is crashing

Treatments, such as DMX-200, aim to bring the FSGS slope back up towards that which occurs with natural aging:

- This can add years to the life of the kidney
- Potential to delay dialysis and/or kidney transplant

DMX-200: Phase 2 met primary and secondary endpoints

Clinically meaningful outcomes achieved for patients,³ with no safety issues

Average reduction of **17%** in proteinuria after 16 weeks treatment on DMX-200 versus placebo¹

“Any reduction in proteinuria could yield years of preserved native kidney function and delay the onset of kidney failure and its attendant morbidity and mortality”

Kidney survival study – Troost et al, August 2020³

EFFICACY

- **86%** of patients demonstrated reduced proteinuria
- DMX-200 reduced inflammatory biomarker by **39%** vs placebo

SAFETY

- No safety concerns – reduced development risk

Dimerix

(ASX:DXB)

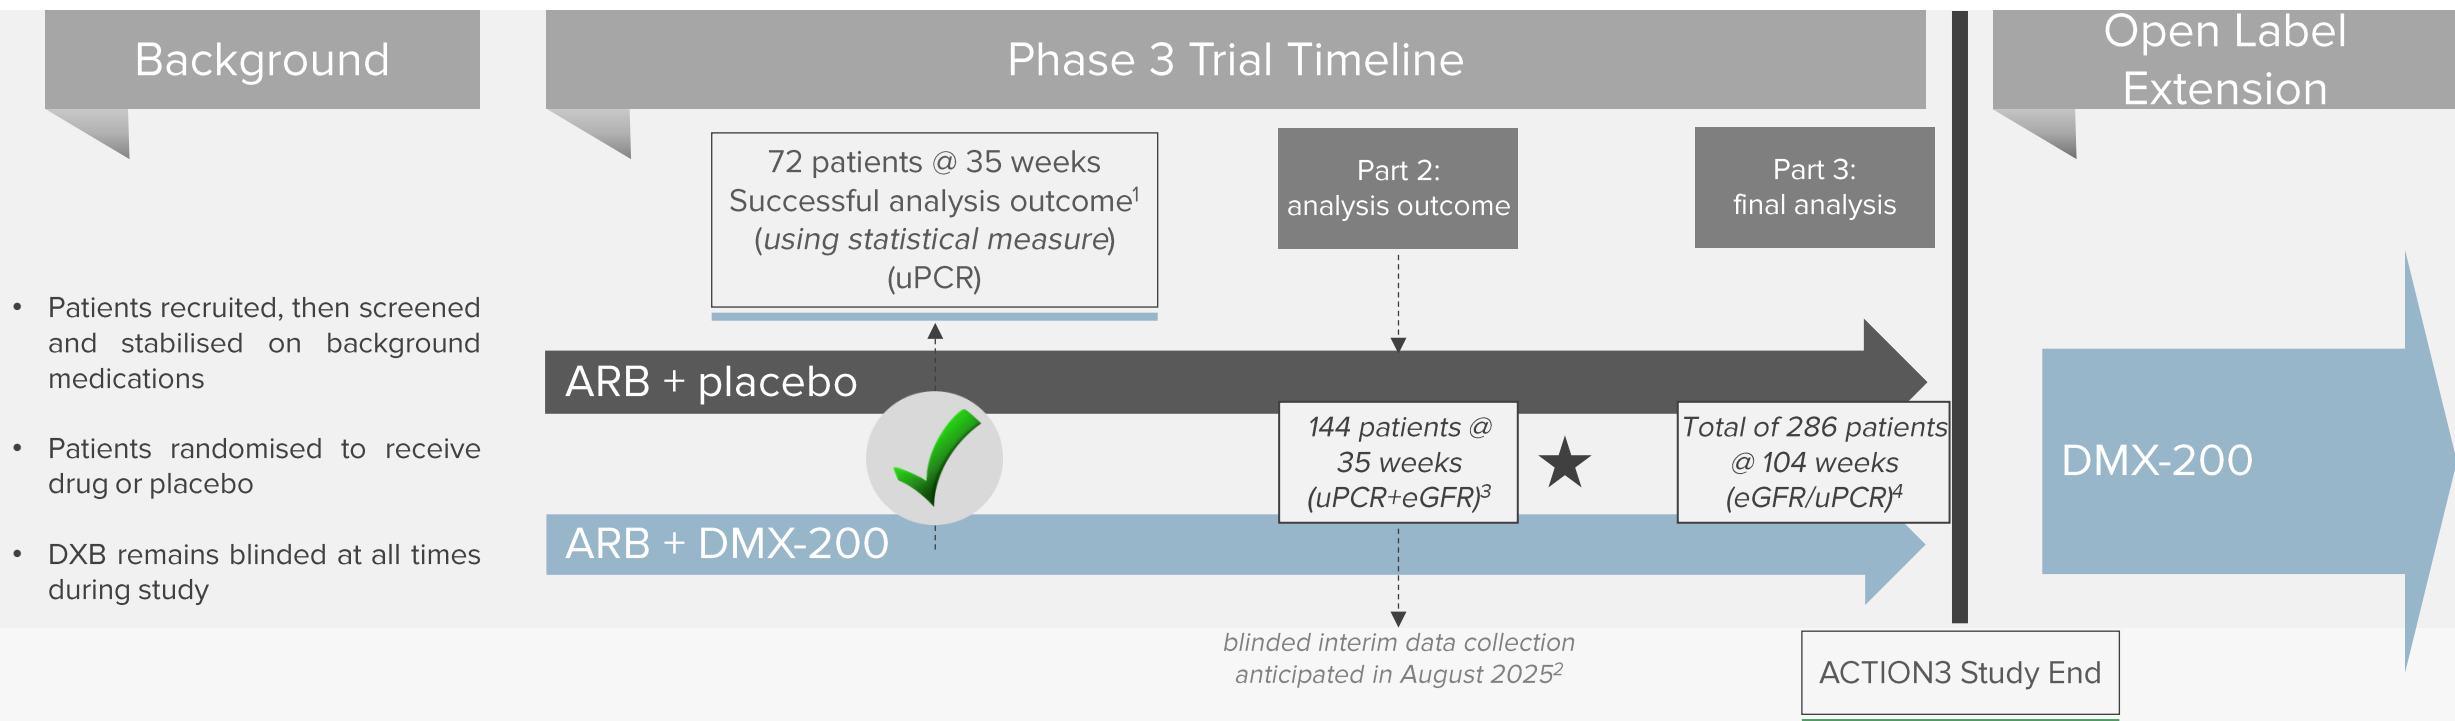

PHASE 3

CLINICAL TRIAL

Phase 3 clinical trial – next steps

A randomised, double-blind, multi-centre, placebo-controlled study of renal outcomes of DMX-200 in patients with FSGS receiving an ARB

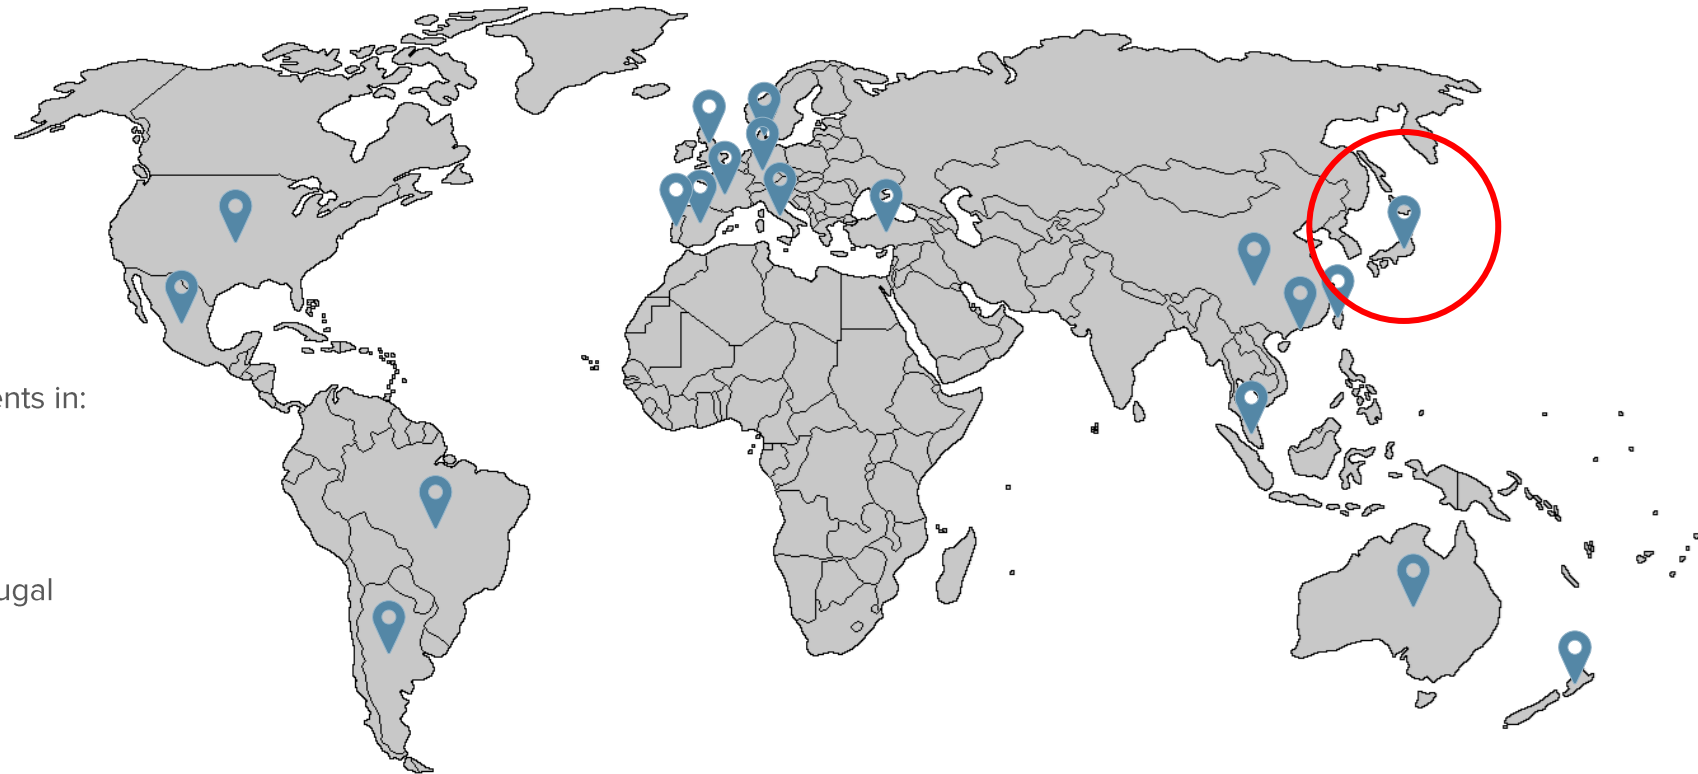

- 155 patients recruited, randomised and dosed²
- Recruit, randomise and dose total of 286 patients - anticipated in Q3 2025²

★ Potential to submit for conditional marketing approval³

Current and planned clinical sites

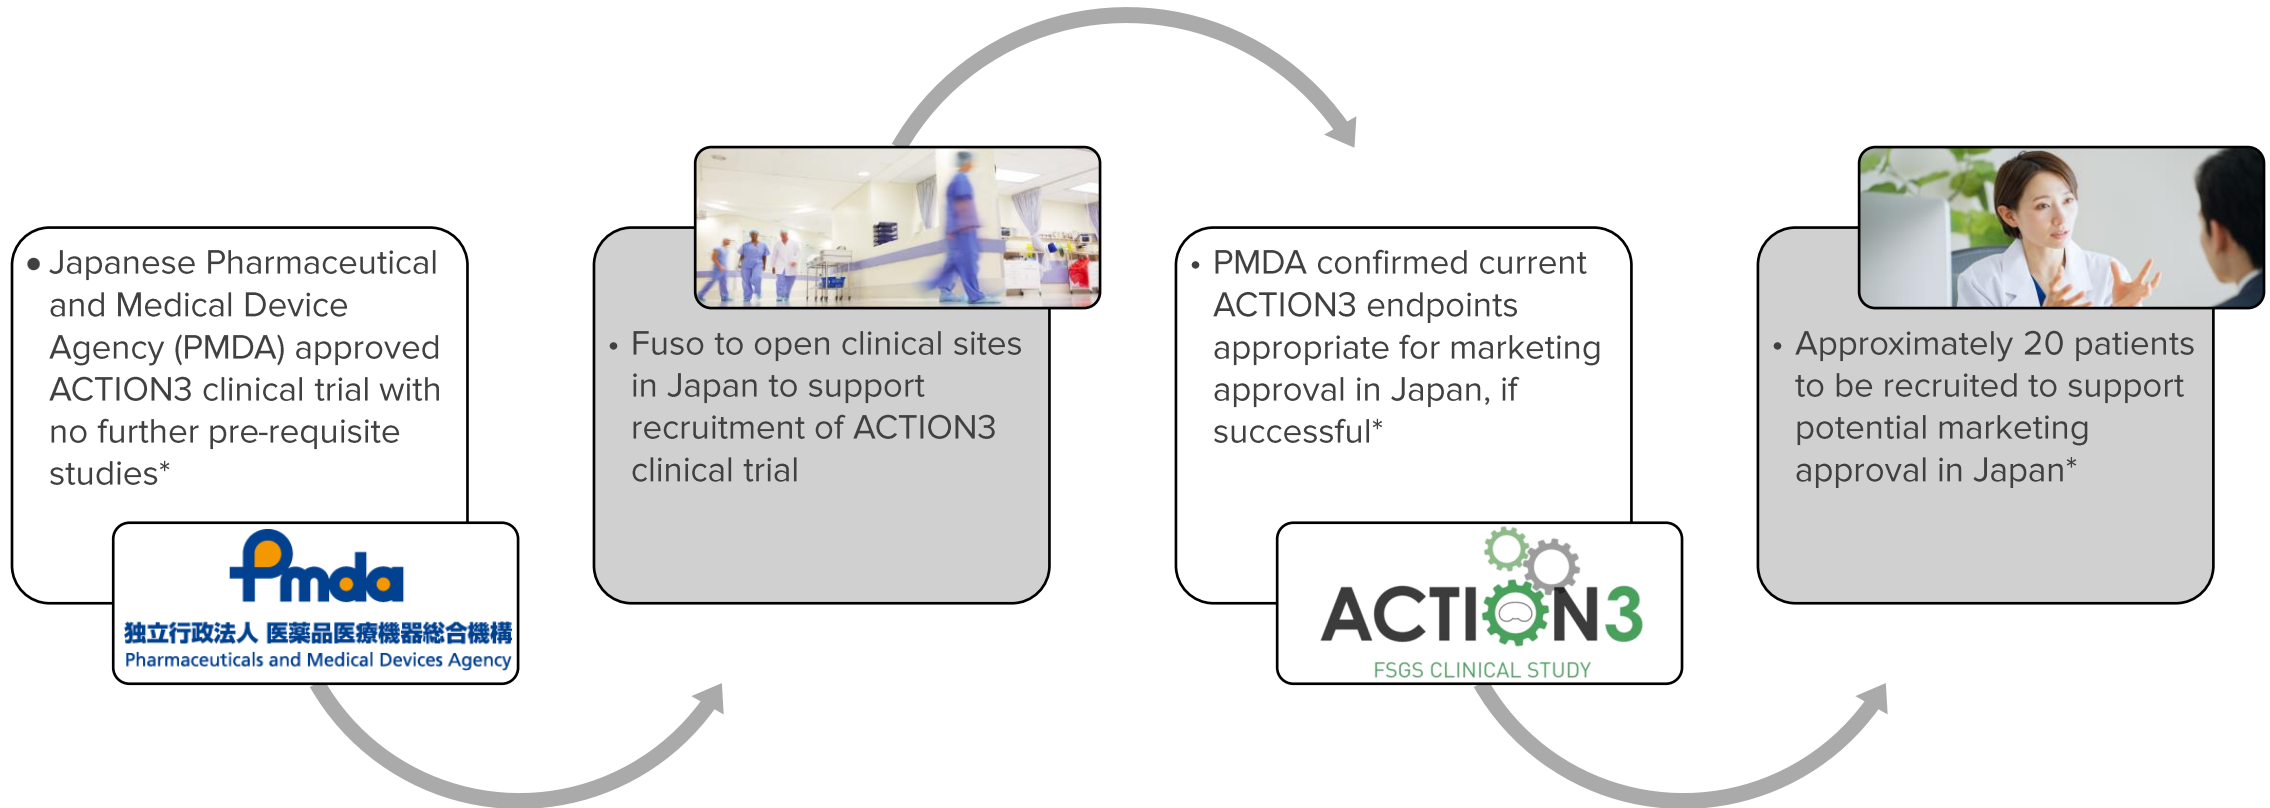

A randomised, double-blind, multi-centre, placebo-controlled study of renal outcomes of DMX-200 in patients with FSGS receiving an ARB

Recruitment planned at 170+ sites to recruit 286 patients in:

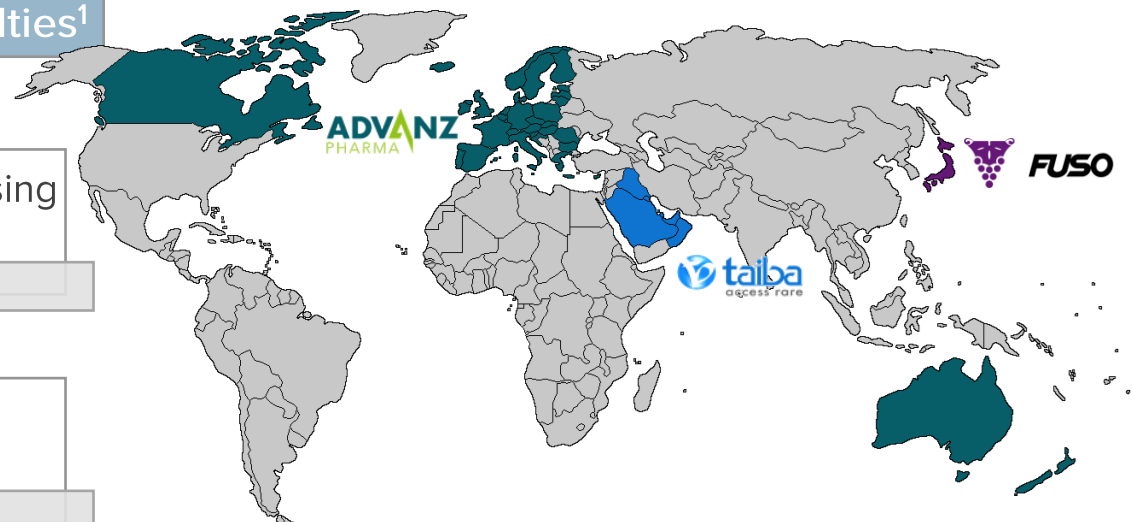

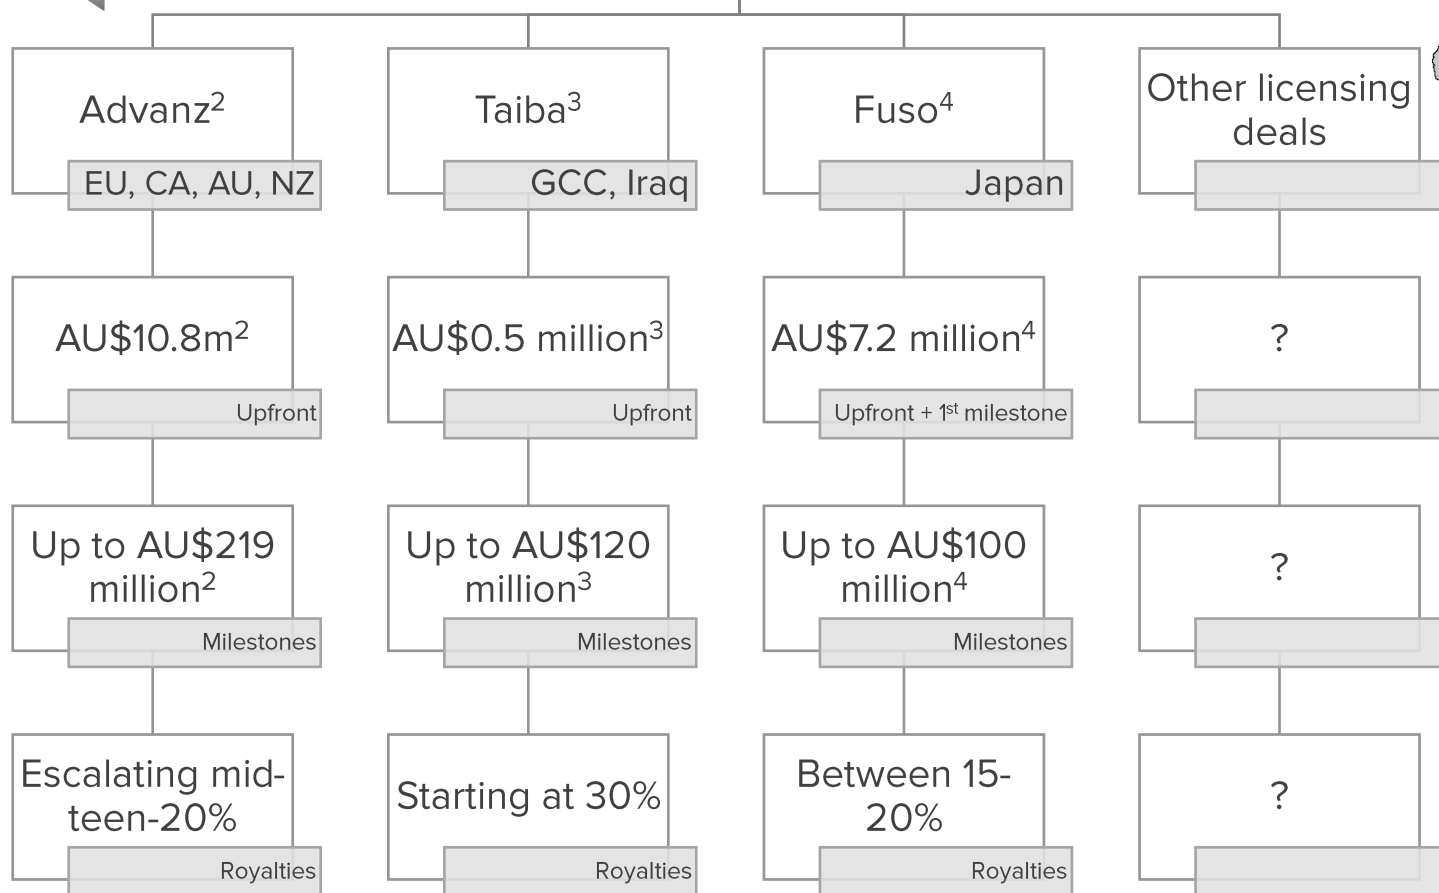

- Australia, New Zealand
- Taiwan, Hong Kong, Malaysia, Thailand
- Mainland China
- Japan
- France, Denmark, UK, Spain, Italy, Germany, Portugal
- Türkiye
- USA, Mexico
- Argentina, Brazil

PMDA regulatory approval received for DMX-200

Summary of licensing deals

Licensing deals collectively valued up to AU\$458 million in total upfront and potential milestone fees + royalties¹

Significant potential additional global value remains, as Dimerix pursues and progresses licensing opportunities with potential partners outside the licensed territories, including in US and Mainland China

Summary | Phase 3 Global Opportunity

David Fuller
B. Pharm (Hons), MBBS
CMO

Previous experience:

- 35 years international experience in drug development, commercialization and corporate leadership
- Planning, Financing, Pre-clinical, Clinical Development, Regulatory Approval, Product Launch, Pharmacovigilance, and Medical Affairs
 - ✓ B.Pharm (Hons) - Pharmacy
 - ✓ MBBS - Medicine and Surgery

Robert Shepherd
PhD, MBA,
CCO

Previous experience:

- Experienced pharmaceutical executive in project management, clinical development and research translation
- BD and strategic alliance leader
- Led multidisciplinary R&D&C teams for 13 years
 - ✓ BSc (Hons) – Genetics
 - ✓ PhD – Molecular Immunology
 - ✓ MBA – Business & Leadership

Bronwyn Pollock
BSc (Hons), MBA
VP, Product Development

Previous experience:

- Experienced pharmaceutical executive in Manufacturing (CMC)
- Successfully developed and submitted multiple dossiers to FDA, EMA, TGA
- Background in project management, technical transfer and product launch
 - ✓ BSc (Hons) – Applied Biology
 - ✓ MBA - Business

Medical Advisory Board

**Professor
Hiddo Heerspink**
PhD

Professor of Clinical Trials and Personalized Medicine: University Medical Center Groningen, the Netherlands. He specializes in the research of novel treatment approaches to slow the onset of diabetic cardiovascular and renal disease. Hiddo has been instrumental in interactions between industry, researchers and regulatory agencies in the validation of surrogate endpoints for renal trials.

**Professor
Alessia Fornoni**
MD, PhD, FASN

Professor of Medicine & Molecular & Cellular Pharmacology: University of Miami. Chief of the Katz Family Division of Nephrology and Hypertension. She has an extensive history of translational excellence for patients with renal disease and has uncovered novel pathogenetic mechanisms and therapeutic approaches for glomerular disorders.

**Professor
Jonathan Barratt**
MD, PhD, FRCP

Mayer Professor of Renal Medicine: Department of Cardiovascular Sciences; University of Leicester and Nephrologist. Jonathan is the IgA nephropathy Rare Disease Group lead for the UK National Registry of Rare Kidney Diseases (RaDaR) and a member of the steering committee for the International IgA Nephropathy Network.

**Associate Professor
Lesley Inker**
MD, MS, FRCPC

An attending physician and Director of the Kidney and Blood Pressure Center in the Division of Nephrology at Tufts Medical Center. Lesley's major research interest is in the estimation and measurement of glomerular filtration rate (GFR) and in defining alternative endpoints for CKD progression trials based on GFR decline and changes in albuminuria.

Dr Muh Geot Wong
MBBS, PhD, FRCP

Renal Physician and Head of the Renal Clinical trials at the Royal North Shore hospital, Sydney, Australia. Muh Geot's main areas of research are in understanding the mechanisms of kidney fibrosis, biomarkers research, and identifying strategies in delaying progressive kidney disease including glomerular diseases.

**Professor
Howard Trachtman**
MD, FASN

Graduated from Haverford College and the University of Pennsylvania School of Medicine. He has been a practicing pediatric nephrologist for 35 years. Has been the PI of NIDDK and industry sponsored clinical trials in glomerular disease and am a Co-Investigator in the NEPTUNE and CureGN observational cohort studies.

**Associate Professor
Laura Mariani**
MD, MSCE

Assistant Professor in the Division of Nephrology at the University of Michigan. Interest in observational studies in glomerular disease, including NEPTUNE and CureGN. Lead on PARASOL program to define FSGS endpoints with by applying statistical methods for clinical outcome definition and prediction of kidney disease progression.

Renal disease landscape

“A squeaky wheel waiting for grease: 50 years of kidney disease management in the US”¹

Historical lack of incentives and public policy have contributed to high costs and poor health outcomes for renal patients¹

2018: workshops and regulatory acceptance of surrogate end points in trials of kidney diseases²

2019 changes in US federal policy and rapid adoption of treatment guidelines have contributed to a sea change in the management of renal disease³

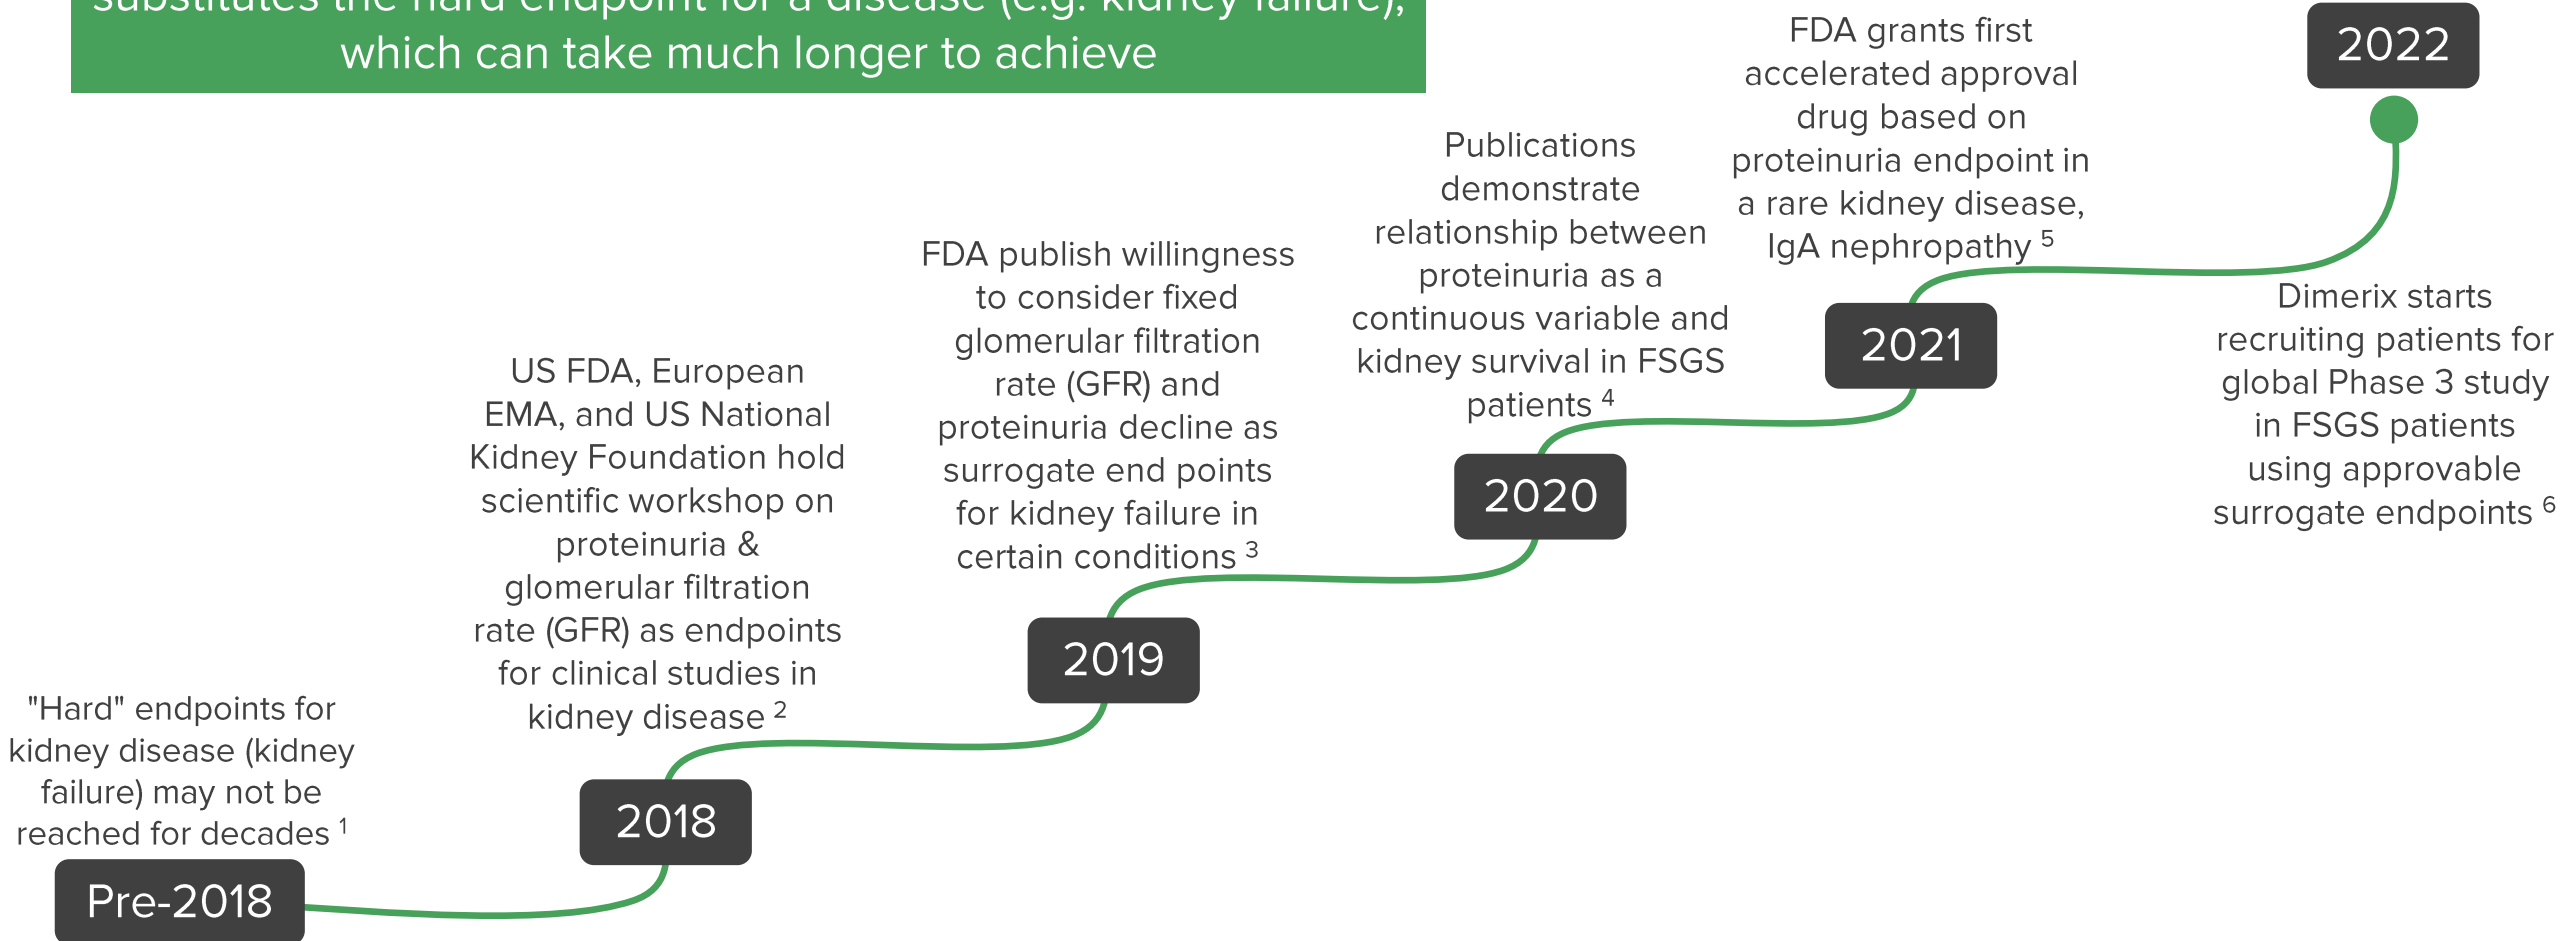

Public health policy, legislation and product innovation have converged to accelerate change in renal space today

“More change in the past 24 months than the past 24 years: The rapid evolution of [kidney disease] management”¹

Clinical study change: use of surrogate endpoints

A surrogate endpoint is an intermediate outcome which substitutes the hard endpoint for a disease (e.g. kidney failure), which can take much longer to achieve

PARASOL: proteinuria as an endpoint for full FDA approval

① Ongoing progress: PARASOL

➤ PARASOL was formed in Dec-23 to address the need to **validate alternative surrogate endpoints** for FSGS, and is a coalition of nonprofit organizations, academia, registries, trials and Sponsors to share data to support analysis⁽¹⁾

- PARASOL confirmed that eGFR slope is a valid endpoint for predicting progression of kidney disease, and ACTION3 is powered based on expected trial variance
- It is recognised FSGS patients see higher proteinuria, even in remission, due to residual scarring of the glomeruli
- PARASOL data demonstrated the strong relationship between a reduction in proteinuria and a reduction in the progression of kidney disease in FSGS patients
- Subject to FDA confirmation, a reduction in proteinuria may also become a validated endpoint for full FDA approval for FSGS

② Biological Plausibility

➤ The FDA has emphasised the need for programs wishing to use proteinuria endpoints to be able to justify the biological plausibility (scientific rationale of why or how the drug candidate is having the desired effect) of the drug on the endpoint chosen

- Dimerix has existing preclinical evidence on the preservation effect of DMX-200 on the specialist cells on the kidney – the podocytes
- Next steps: agree with FDA appropriate proteinuria endpoints, and potential for accelerated approval, for DMX-200 in the ACTION3 Phase 3 clinical trial
- PARASOL has increased the range of potential endpoints that may best show the treatment effect of DMX-200

③ ACTION3 capturing all proposed endpoint data: eGFR and proteinuria

Proteinuria

- Randomised, double blind PCR values over 24 months
- PCR captured across 4-week washout
- PCR measured over additional 24 month open-label period

eGFR slope

- Randomised, double blind eGFR values captured over 24 months, including raw values and total eGFR slope

Other endpoints

- Classical definitions of complete and partial remission
- PARASOL-informed response endpoints
- Hard-renal endpoints (where available)

Renal licensing deals details

Policy change: renal disease healthcare economic burden

~40 million
adults have kidney
disease (~15% of the
adult population) in the
US in 2021¹

US\$88 billion
estimated total US
Medicare expenses
costs/year for renal
patients in 2021^{1,3}

2019
White House executive
order issued: incentives
for providers to delay
patient progression to
renal failure²

Economic cost of kidney failure in the US

Total Medicare expenses per year costs for kidney failure patients (2009-2021E)³

FSGS market

FSGS is the most frequent primary glomerular disease that reaches end-stage renal failure in the US¹

>2,600

New diagnosed cases per year in US²

47%

Of all diagnosed FSGS cases globally are in US³

0

Drugs specifically approved anywhere in the world

Multi-billion dollar market potential

Strong licensing potential upside

Attractive reimbursement/pricing potential

- Example pricing for other rare kidney disease drugs :
- in the US (i.e. Filspari in IgAN)⁴ is **US\$9,900 p/month**
 - in Europe/UK (i.e. Kinpeygo/Tarpeyo)⁵ is **US\$8,267 p/month (€7,630)**

FUSO Pharmaceutical Industries, Ltd.

Fuso brings a wealth of experience in pharmaceutical development, sales and marketing across Japan

Specialty pharmaceutical company in the field of dialysis and renal/urology

Developed Japan's first dialysis fluid, strong contribution to development of dialysis treatment

As a pioneer in dialysis products, Fuso plans to continue to improve patients' lives by developing patient-friendly renal products

“Supporting Life, Nurturing Life”

Dimerix/ **FUSO**: strategic partners in kidney disease

“We, FUSO, are greatly honoured to be involved in the development of a new drug for FSGS, as there are currently no approved drugs for the treatment of FSGS. It is a truly valuable opportunity for us to partner with Dimerix, and we will work together with Dimerix to do our best to quickly deliver safe and effective new drugs to patients suffering from FSGS.”

Mikio Toda, President and Representative Director, FUSO Pharmaceutical Industries, Ltd.

“We are delighted to partner with FUSO for the commercialisation of DMX-200 in Japan. This partnership reflects a confidence not only in the significant potential for DMX-200 in FSGS patients but also in Dimerix’ capabilities in the development of DMX-200. FUSO’s expertise and resources will be invaluable in supporting Dimerix to advance our shared goal of developing and commercialising DMX-200 and bringing hope to those patients desperately in need of treatment options.”

Dr Nina Webster, CEO & Managing Director, Dimerix

Key elements of **FUSO** partnership

FUSO acquires exclusive license to commercialise DMX-200 for FSGS in Japan

Dimerix to receive up to ¥10.5 billion (~AU\$107 million*) million in upfront and milestone payments, plus royalties

- ¥300 million (~AU\$3.1 million*) within 40 days of signing
- ¥400 million (~AU\$4.1 million*) first development milestone due on first clinical site initiation in Japan, anticipated Q1 2025
- up to ¥3 billion (~AU\$30.6 million*) in further potential development milestones
- up to ¥6.8 billion (~AU\$69.4 million*) in potential sales milestones
- 15-20% royalties on net sales

FUSO will be responsible for all costs in Japan, including site identification, contracting and initiation; patient recruitment; site management; investigator costs; any further non-clinical studies (if required)

Dimerix will continue to fund and execute the global ACTION3 Phase 3 study for DMX-200 in FSGS patients outside of Japan

FUSO will be responsible for submission and maintenance of the regulatory dossier in the licensed territories, as well as all sales and costs of marketing activities

Dimerix retains all rights to DMX-200 in all other unlicensed territories

DMX-200 – working on inflammatory signalling pathway

A CCR2 inhibitor working synergistically alongside the current standard of care (AT1R blocker): G protein-coupled receptor (GPCR)

DMX-200 unique heteromer pharmacology

Proprietary discovery platform (Receptor-HIT) identified:

- Formation of AT1R and CCR2 heteromers;
- Novel pharmacology (potentiation of signaling)
- Dual antagonism required for completed inhibition

Proposed non-clinical safety package suitability for NDA confirmed with FDA¹

↓ Proteinuria

↓ Macrophage infiltration

Retained podocyte numbers

DMX-200 Phase 2 effect on inflammatory biomarker¹

- 16 weeks treatment with DMX-200 vs placebo reduced inflammatory biomarker by 39%:
 - DMX-200 blocks receptor responsible for inflammation
 - Translates to reduced inflammation and subsequent fibrosis (scarring) in the kidney²

Intellectual property and exclusivity

Advancing the broader pipeline

Additional longer term pipeline opportunities diversify risk and potential sources of revenue

DMX-200 potential label expansion

Potential to expand DMX-200 into other rare kidney diseases where inflammation is a key driver of the disease

Phase 2/3 potential

DMX-700 for respiratory/renal fibrosis

Preclinical studies show that DMX-700 significantly reduced lung injury by 80% ($p < 0.01$) after 21 days treatment¹

Pre-clinical asset

Undisclosed Opportunities

Commercially attractive pipeline of G Protein-Coupled Receptors (GPCR) targets of inflammatory diseases with an unmet need

Pre-clinical identified opportunities
