Major Milestone Recognised

Optiscan is pleased to announce that it has received a milestone payment of €180,000 from Carl Zeiss in recognition of Optiscan's disposable sheath development.

This recognition and consequent payment marks the critical downstream progression of this project following the successful completion of testing announced in August this year. Optiscan is delighted with the outcome of its sheath development which upholds Optiscan's philosophy of a no compromise development of the highest quality, functional and enduring products.

The sheath will now be integrated with Optiscan's stand-alone rigid endomicroscopy system, which will be deployed in the field of neurosurgery providing real time, high resolution tissue imaging at a cellular level, bringing the microscope to the patient.

Optiscan is in the process of refining its submission for FDA regulatory clearance and will keep shareholders apprised of material developments within that process.

The opportunity beckoning within neurosurgery is a very promising one and is backed by the significant expertise of our market partner Carl Zeiss, the world number one player in neurosurgical visualisation.

About Optiscan

Optiscan is a global leader in microscopic imaging technologies for medical markets. Optiscan's unique and patented technologies enable high-powered microscopes to be miniaturised and used inside the body. The technology enables microscopic imaging of up to 1000 times magnification to be achieved. Doctors can use the technology to instantly see cellular level details of tissue without the requirement to surgically remove tissue (biopsy).
