DATE: **27 JANUARY 2016**

FOR IMMEDIATE RELEASE

SECOND BATCH OF ASSAY RESULTS RECEIVED FROM JV PARTNERS

- **Further high-grade massive sulphides intersected at Maibele North Project**
- **High-Grade Nickel sulphide mineralisation intersected up to 400m along strike from existing resource**

Botswana Metals Limited ("BML") is pleased to advise that the it has received a second batch of assay results from Joint Venture partners, BCL Limited, for the ~12,000m drilling campaign completed in 2015 at Maibele North. (Table 1 – Significant Intersections). BML recently received results from further 26 completed infill and extension holes from assays that were undertaken at an offsite independent laboratory as well as from onsite analysis at BCL's in-house laboratory facitities at both the Tati-Ni and Selibi Phikwe Ni-Cu mines. Results from the final 5 holes are all that remain to complete the analysis of the program.

Highlights of the second batch of assay results include:

MARD0122:

- ***4.0m @ 1.80% Ni, 0.59% Cu, 882 ppm Co, 0.08g/t Au, 1.51g/t 4PGEs from 134.23m***

Including

  - ***1.59m @ 2.17% Ni, 0.74% Cu, 1,054ppm Co, 0.06g/t Au, 2.07g/t 4PGEs from 134.23m***
  - ***1.23m @ 2.21% Ni, 0.4% Cu, 1,040ppm Co, 0.04g/t Au, 1.64g/t 4PGEs from 137m***

MARD0129:

- ***2.18m @ 1.55% Ni, 1.28% Cu, 917 ppm Co from 200.27m***

Including

  - ***1.03m @ 2.17% Ni, 2.22% Cu, 1,300ppm Co from 200.27m***
  - ***0.40m @ 1.7% Ni, 0.38% Cu, 900ppm Co from 202.05m***

    (note: Assays performed at BCL Limited in-house laboratory - Au and PGEs not assayed for)

MARD0127:

- ***0.59m @ 2.35% Ni, 0.56% Cu, 1130 ppm Co, 0.12g/t Au, 1.05g/t 4PGEs from 73.46m***

Email info@botswanametals.com.au
www.botswanametals.com.au

MARC0099:

- ***1.0m @ 2.27% Ni, 2.02% Cu from 240m***
  (Note: Assays performed at BCL Limited in-house laboratory - Co, Au and PGEs not assayed for. MARC0099 is a RC hole)

MARD0146:

- ***0.14m @ 2.13% Ni, 0.15% Cu from 252.58m***
- ***0.72m @ 1.17% Ni, 0.54% Cu from 254.80m***
  (Note: Assays performed at BCL Limited in-house laboratory - Co, Au and PGEs not assayed for)

All widths are down hole thicknesses. A full compilation of significant intersections is included in Table 1 below. Samples assayed at BCL's in-house facilities were analysed mostly at the laboratory at the Selebi Phikwe Ni-Cu mine, with checks undertaken at the company's Phoenix Laboratory at the Tati Ni Mine. The Phoenix laboratory at Tati-Ni is SANAS accredited to the ISO 17025 international standard. The laboratory at the Selebi Phiwke Ni-Cu mine is currently un-certified. Identical QAQC protocols were appled to samples for all three laboratories and QAQC results were deemed to be acceptable for all sample batches.

Details

The Board of Botswana Metals is highly encouraged by the continuing good results from the Maibele North Project. This batch of results has continued to return encouraging Ni, Cu, Co, Au and 4PGEs (Pt, Pd, Rh, Ru) from sulphide zones both within the existing resource and along strike for over 400m to the east of the current resource. The results now complete assaying on holes from MARC0099 through to MADD0148. Results from the final four holes, MADD0149 to MADD0152 remain outstanding.

The program was designed to provide infill detail within the existing resource to enable a new resource calculation to an indicated or measured status, as well as to test new conductors detected along strike and adjacent to the orebody that were detected in ground electro-magnetic (EM) prograns undertaken in 2015.

The infill drilling has confirmed the extent of the existing mineralisation and, where signifcant sulphide zones have been encountered, metal contents of a similar tenor to that revealed by the 2014 drilling have been encountered. The density of drilling data will enable an upgraded resource status and form an integral component of the ongoing Pre-feasibility studies.

The drilling of SQUID EM conductors along strike to the east of the resource has returned laterally continuous mineralisation for over 480m. Drilling of this extension is in the early stage but the series of 80m spaced fences of have intersected sulphide mineralisation that remains open at depth and along strike. This exciting new zone of mineralisation has the potential to add significant tonnes to the Maibele North resource. Further deep potential exists at Maibele North, with the mineralisation open at depth across the entire deposit.

Of particular encouragement is the intersection in 2014 drill hole MARD0094, where nearly 7m of Ni sulpide mineralisation was intersected some 200m below, and potentially down-dip, of the recently discovered extension zone (Figures 2 and 3).

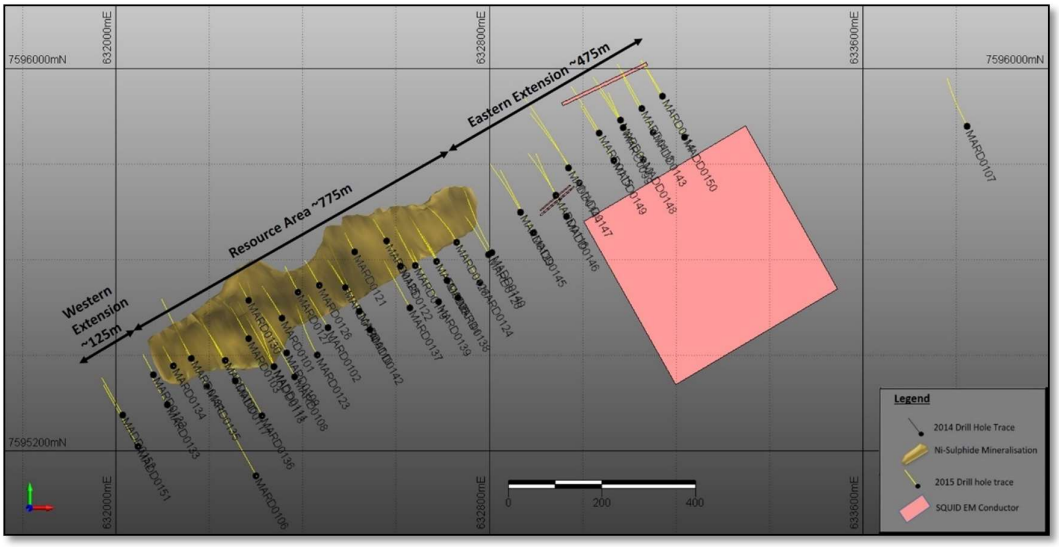

Figure 1: Collar Plan of the 2015 drill program (Yellow Traces) showing the strike length of the existing resource (gold shape) and the strike lengths of the recently discovered east and west extensions. The mineralisation is open to the east, west and at depth.

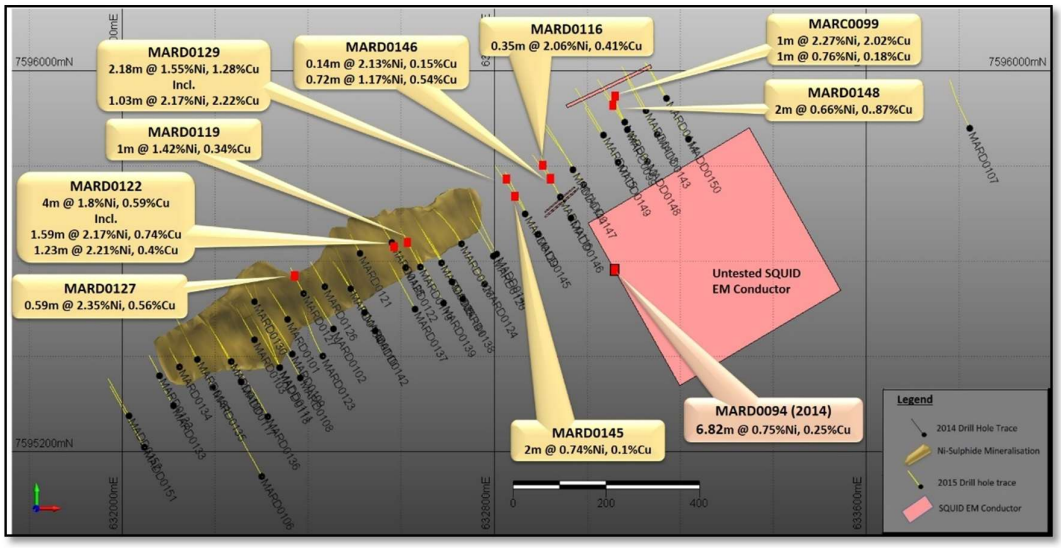

Figure 2: Plan view of the 2015 drill hole traces (yellow) showing the highlight intersections from the recent batch of assay results. Pink shapes represent SQUID EM conductor plates.

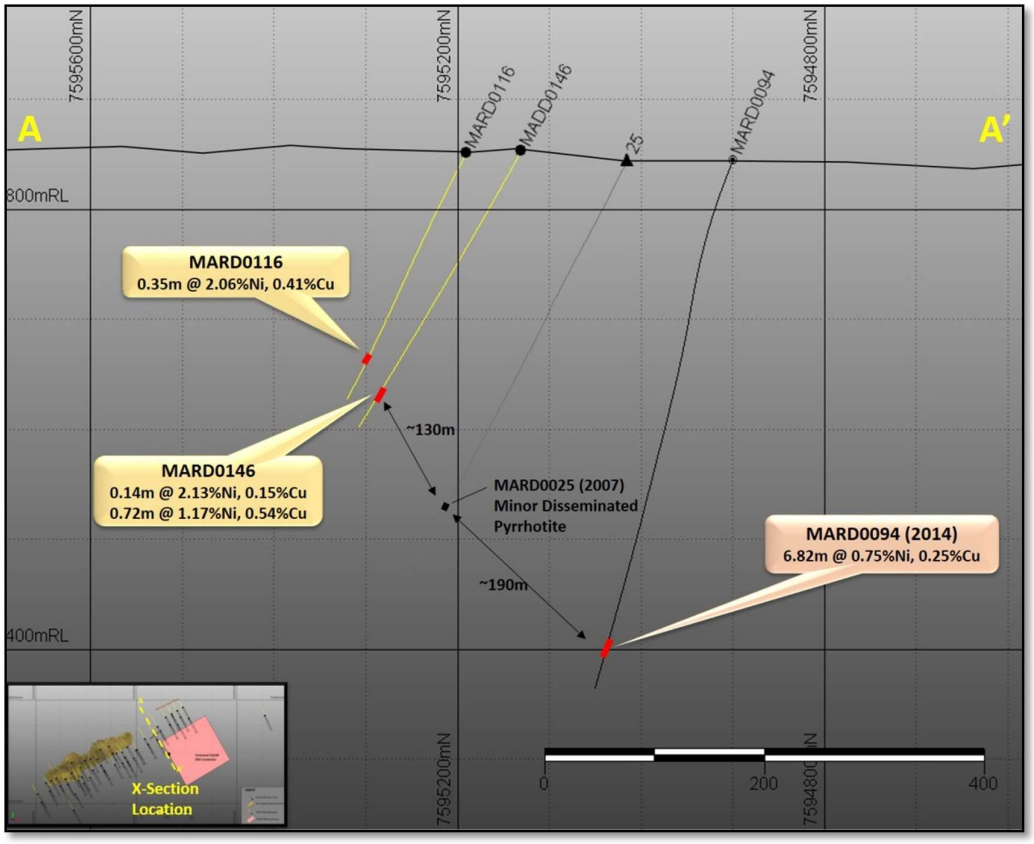

Figure 3: Cross section through holes MARD0116, 0146, 0025 and 0094. The section is located approximately 180m northeast of the current resource and shows the relationaship between recently discovered massive and semi-massive sulphide mineralisation hole MARD0116 and MADD0146. Hole MARD0094 was drilled in 2014 and possibly marks the extension of this mineralisation, some 320m down dip and ~225m vertically below the recently discovered sulphide zone. Historic hole, MADD0025, intersected minor pyrrhotite disseminations approximatley 130m down dip of MADD0146.

Table 1: All Significant intercepts from the recently received batch of assay results

QAQC protocols and sample handling/preparation techniques were employed across all holes. QAQC analysis for all samples from each laboratory was deemed to be within acceptable limits. The BCL Limited laboratory at Tati-Ni is SANAS accredited to the ISO 17025 international standard. The in-house laboratory at the Selebi Phiwke Ni-Cu mine is currently un-certified. Assay techniques and detection limits are detailed in the Appendix 1 - JORC 2012 Table 1 below.

Patrick Volpe
Chairman

The information in this report that relates to Exploration Results is based on, and fairly represents, information and supporting documentation compiled by BML staff on site and provided to Mr Steve Groves who is a Member of The Australasian Institute of Mining and Metallurgy. Mr Groves is a consulting geologist to BML and has previously been employed as the Exploration Manager at BML. Mr Groves has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Groves consents to the inclusion in this report of the matters based on his information in the form and context in which it appears.

APPENDIX 1 – JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

CRITERIA	JORC Code Explanation	Commentary
Sampling techniques	- *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* - *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* - *Aspects of the determination of mineralisation that are Material to the Public Report.* - *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine*	• **Drill core is arranged neatly in 1m core trays for HQ (typically weathered rocks above the limit of oxidation) and 1.5m core trays for NQ core from competent rock. Core is marked at every metre along an orientation line.** • **Samples for independent laboratory analysis are collected at appropriate geological and or mineralization boundaries and are generally 1m or less in width.** • **Spot analysis using an XRF analyser has been undertaken at every 10cm interval across the sulphide mineralised intervals at the BML site office in Tshokwe using a portable XRF analyzer (INNOV-X Delta Premium). Industry standards and blanks are used to monitor the calibration of the instrument.** • **This information is used as a guide to the potential Ni tenor of the sulphides and primarily used to determine appropriate sampling intervals for independent Laboratory**

CRITERIA	JORC Code Explanation	Commentary
	nodules) may warrant disclosure of detailed information.	**analysis**
Drilling techniques	- *Drill type (eg core, reverse circulation ,open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• **The holes referred to in this release have been drilled by Reverse Circulation or HQ Diamond core through the weathered rock and NQ Diamond Core through unweathered rock and the mineralized zones.** • **All core drilling is standard tube method.** • **All competent core from the current program is oriented using a spear orientation method.** • **Historic holes have been either NQ core, HQ core or Reverse Circulation percussion methods.**
Drill sample recovery	- *Method of recording and assessing core and chip sample recoveries and results assessed.* - *Measures taken to maximise sample recovery and ensure representative nature of the samples.* - *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• **The core is measured after every run, and the results are compared to the actual run to calculate core recoveries. Core is handled with care to avoid breakage and crumbling. Core is washed and laid onto holding core trays.** • **HQ core is used on friable ground, rotation speeds and water pressure are monitored to avoid destroying the core. A soft rubber mallet is used to drive out core from the barrel.** • **No significant core loss or recovery issues have been recorded in the current drill program.**
Logging	- *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* - *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* - *The total length and percentage of the relevant intersections logged.*	• **All core will be photographed with beginning, ending and intermediate intervals clearly marked on each box. Core will be photographed prior to sampling or any other procedures that may disturb the initial orientation of the core.** • **The core will be logged in appropriate detail including identification of lithology, structure, alteration, mineralization and other notable characteristics.** • **Percentages of core recovery and Rock Quality Descriptor (RQD) will be included in the log. The core recovery will be calculated based on each drill run (interval). The RQD calculation will be based on the total length of core sections recovered that are greater than 2.0**

CRITERIA	JORC Code Explanation	Commentary
		times the core diameter for each drill run or interval.
Sub-sampling techniques and sample preparation	- *If core, whether cut or sawn and whether quarter, half or all core taken.* - *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* - *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* - *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* - *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* - *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• **Core is cut along the marked orientation line, half core is sampled for metallurgical test work. The remaining half core is cut for quarter core for lab assaying and storage.** • **No field duplicates were taken.** • **For lab dispatch, blanks and certified reference material are inserted at every 5th sample for QAQC.**
Quality of assay data and laboratory tests	- *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* - *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* - *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	SGS South Africa • For all samples the analytical techniques used a four acid digest multi element suite with ICP/OES or ICP/MS finish (25 gram or 50 gram FA/AAS for precious metals). The acids used are hydrofluoric, nitric, perchloric and hydrochloric acids, suitable for silica based samples. The method approaches total dissolution of most minerals. Total sulphur is assayed by combustion furnace. • Platinum group elements and gold were assayed by Fire Assay following either Pb or NiS collection followed by ICP-MS finish. BCL Laboratory - Selebi Phikwe • All samples were assayed for Ni and Cu via Aqua Regia and Atomic Absorption Finish to a detection limit of 0.01% • The laboratory at the Selebi Phiwke Ni-Cu mine is currently un-certified. BCL Laboratory – Tati Ni • All samples were assayed for Ni and Cu via XRF (X-ray Fluorescence) to a detection limit of 0.01% (Method PAS 10) • The BCL Limited laboratory at Tati-Ni is SANAS accredited to the ISO 17025 international standard.

BOTSWANA Metals Limited

ABN 96 122 995 073

CRITERIA	JORC Code Explanation	Commentary
Verification of sampling and assaying	- *The verification of significant intersections by either independent or alternative company personnel.* - *The use of twinned holes.* - *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* - *Discuss any adjustment to assay data.*	• **The data were examined by the senior personnel on site.** • **The primary data were audited and verified and then stored in a SQL relational data base.** • **No data have been adjusted.**
Location of data points	- *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* - *Specification of the grid system used.* - *Quality and adequacy of topographic control.*	• **The data were recorded in longitude/latitude WGS84.** • **The terrain is largely flat.** • **Down hole surveys are carried out on all holes at 4m intervals using a Flexit survey tool.** • **N/A – All historic drillholes have been surveyed using DGPS with an accuracy of <1m.**
Data spacing and distribution	- *Data spacing for reporting of Exploration Results.* - *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* - *Whether sample compositing has been applied.*	• **The current drilling is designed to confirm previous drill results, collect metallurgical samples and step out form the know areas of mineralization.** • **The drill hole spacing is deemed appropriate for achieving the objectives of the program and will enable a maiden JORC 2012 compliant resource to be calculated.**
Orientation of data in relation to geological structure	- *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* - *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• **The drill lines are oriented at approximately 90 degrees to the strike of both local and regional geological trend.** • **Drill holes are at 55 degree or 60 angle and orientation of holes does address the orientation of structures.**
Sample security	- *The measures taken to ensure sample security.*	• **Samples were taken and transported by BML personnel to the BML site office Prior to XRF analyses the samples are locked in the BML office.**
Audits or reviews	- *The results of any audits or reviews of sampling techniques and data.*	• **The data were examined by the independent consultant Mr Steve Groves of Perth in Australia and considered appropriate.**

Section 2 Reporting of Exploration Results

(Criteria in this section apply to all succeeding sections.)

CRITERIA	JORC Code Explanation	Commentary
Mineral tenement and land tenure status	- *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* - *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• **The results reported in this announcement are located in PL110/94 which is a granted Exploration Licence held by African Metals Limited, a 100% owned subsidiary of Botswana Metals Limited.** • **PL110/94 is subject to a Joint Venture agreement with BCL Limited.** • **PL110/94 was recently extended for a further two years and is in good standing.**
Exploration done by other parties	- *Acknowledgment and appraisal of exploration by other parties.*	• **Interpretations and conclusions in this announcement refer in part to results generated by historic exploration work conducted by Roan Selection Trust, Falconbridge, Cardia Mining and Botswana Metals.** • **Botswana Metals considers all previous exploration work to have been undertaken to an appropriate professional standard.**
Geology	- *Deposit type, geological setting and style of mineralisation.*	• **The Maibele North Prospect is hosted within the Magogaphate Shear Zone - a major geological structural feature, generally considered to mark the boundary between the Archaean aged (>2.5 billion year old) Zimbabwean Craton and the Limpopo Belt or Limpopo Mobile Zone (LMZ). . The nickel-copper deposits of Selebi Phikwe lie within the northern part of the Central Zone of the Limpopo Mobile Belt, whilst the nickel copper deposits of Phoenix, Selkirk and Tekwane lie in the Zimbabwean Craton. The Central Zone of the LMZ comprises variably deformed banded gneisses and granitic gneisses, infolded amphibolites and ultramafic intrusions that that have the potential to host Ni-Cu sulphide mineralization. Ni-Cu-PGE mineralization at Maibele North and Airstrip copper is spatially associated with an ultramafic intrusion.**
Drill hole Information	- *A summary of all information material to the understanding of the exploration*	• **A table detailing collar coordinates and relevant directional information**

CRITERIA	JORC Code Explanation	Commentary
	results including a tabulation of the following information for all material drill holes: ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* - *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	**of the current drill program is included in the release.**
Data aggregation methods	- *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* - *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* - *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• **Where uneven sampling intervals have contributed to an averaged result, the result has been calculated by a weighted average technique that incorporates the interval width of each contributing sample.** • **A grade cut off of 0.3% and internal dilution of <2m has been used in the calculation of significant intercepts.** • **No grade truncations have been applied to the data.** • **The Maibele North ore is interpreted to be genetically and mineralogically similar to the ore treated at the nearby Selebi Phikwe smelter where current recovery grades in the flotation plant average 84% for Ni and 95% for Cu. Where Ni Eqv calculations have been undertaken on historic assay results it has been assumed that similar high recoveries will be achievable. The current drill program has been designed to assess the metallurgical properties of the Maibele North mineralisation and the indicative recoveries will be published in due course.** • **Given that that the Maibele North project is currently the subject of a Joint Venture with the nearby Mine and Smelter operator, BCL, BML assumes that no impediments in recovering and selling the metals contained in the deposit would exist provided an viable economic resource can be defined.**

CRITERIA	JORC Code Explanation	Commentary
Relationship between mineralisation widths and intercept lengths	- *These relationships are particularly important in the reporting of Exploration Results.* - *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* - *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• **The precise geometry of the mineralization with respect to the drill hole angle is not known and thus, all drill hole results are reported as down hole length.** • **The drill holes in the current program are inclined reconnaissance holes based on the average dip of exposed units. The orientation of the mineralization is unknown and true width is unknown.** • **Geotechnical logging is under way to address the geometry of mineralisation.**
Diagrams	- *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• **Plan view and/or cross section maps of the reported drill holes are included in this announcement.**
Balanced reporting	- *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• **The results in this announcement are interpreted to lie within the plane of a mineralized trend that is coincident with an ultramafic intrusion and encompasses the Maibele North and Airstrip Copper Prospects.**
Other substantive exploration data	- *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• **There is no other material exploration data that have not been previously reported.**
Further work	- *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* - *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• **The Maibele North Prospect is currently the subject of a 6000m drill program of 30 holes designed to verify previous results, obtain metallurgical samples and ultimately to facilitate the calculation of an initial JORC compliant resource for the project.** • **If a potentially economic resource is defined, then it is envisioned that he project will proceed to Pre-Feasibility Studies.**
