Hammer Plans to Commence Exploration Drilling of Mount Isa Copper Gold Targets

Hammer Metals Limited (**ASX: HMX**) ("Hammer" or "the Company") announces that it plans to commence a new RC drilling programme in mid-October of approximately 1500m. to test several of its copper and gold targets within the Mount Isa project.

Some of the targets to be tested include:

- Overlander
- Kalman
- Scalper
- Revenue
- Tiny Boot

It is anticipated that drilling at Overlander will be based on the results of a down hole EM geophysical survey being undertaken, while drilling at Kalman will look to expand on the exceptional molybdenum and copper results achieved in the last drill programme.

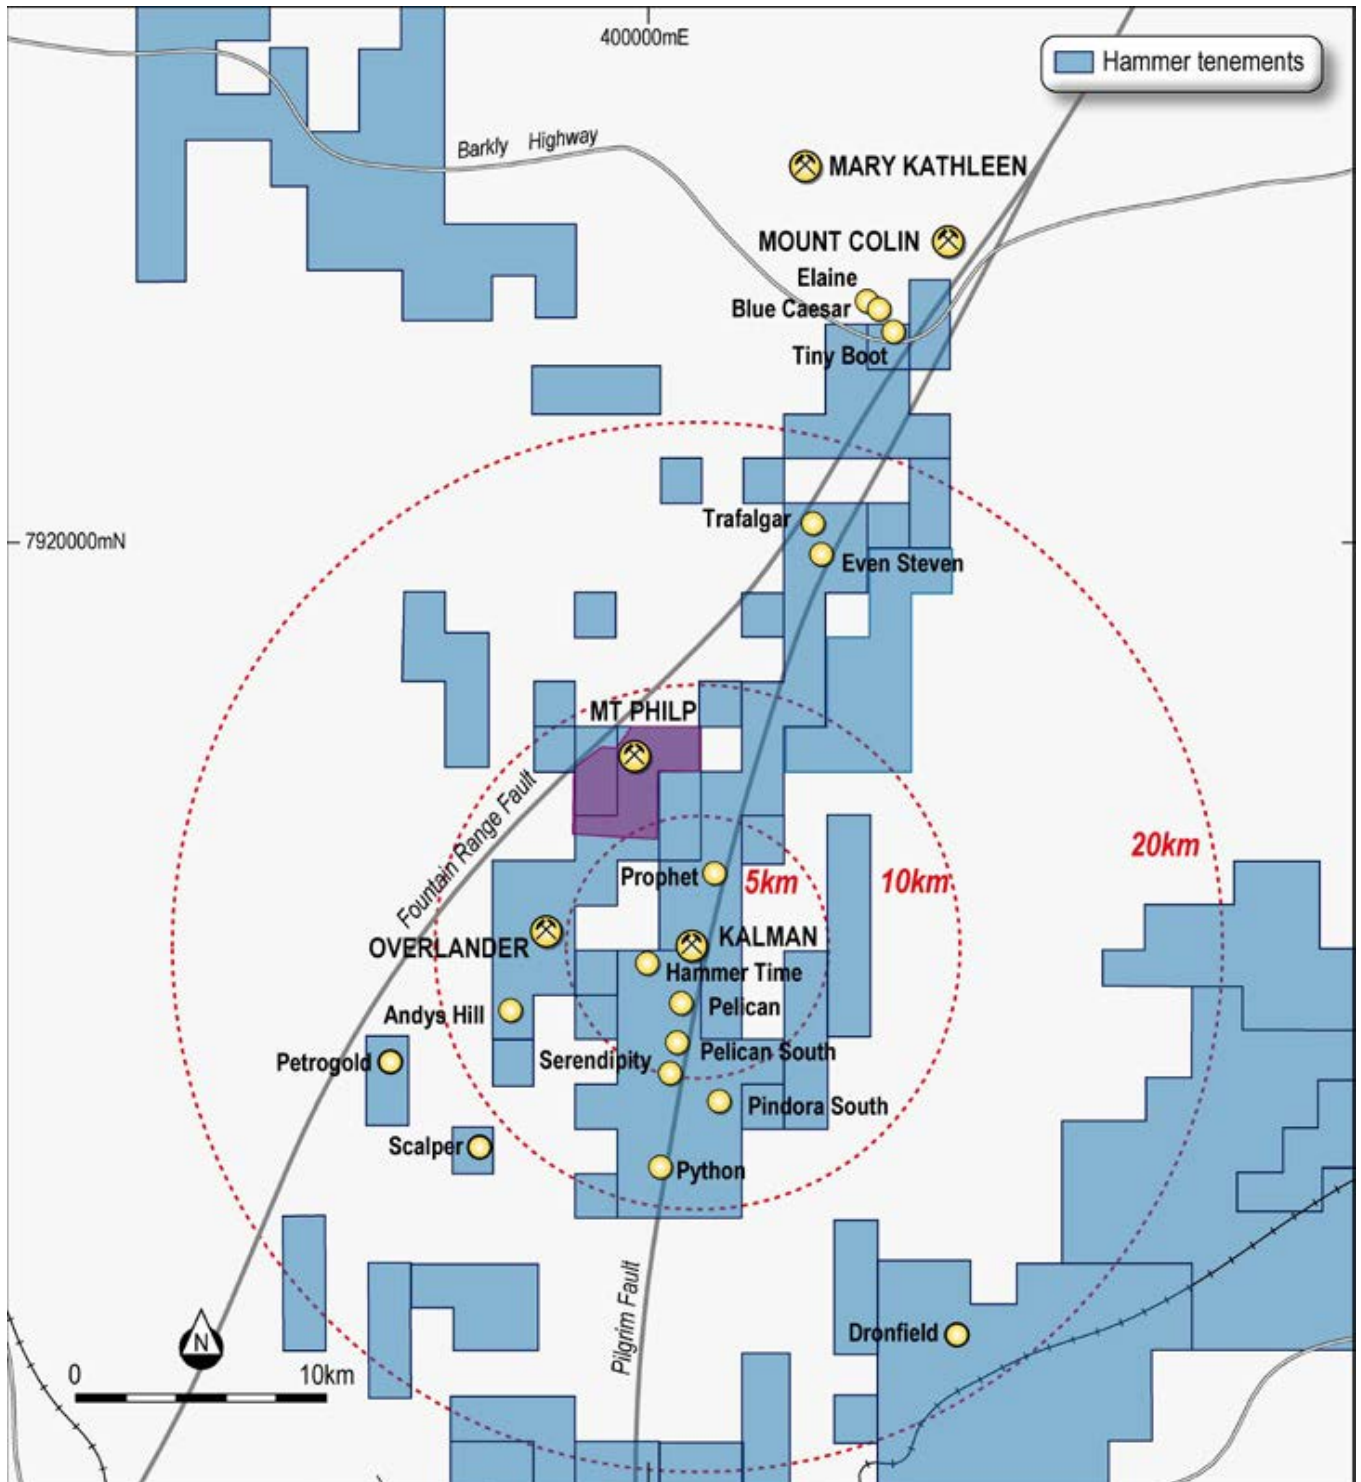

All targets listed may not be tested in this programme, depending on but not limited to weather and access conditions. It is expected that drilling will continue for approximately one month, with assays to follow shortly thereafter.

The programme is to explore for further high grade copper and gold mineralisation within close trucking proximity of Hammer's Kalman deposit.
