

More standout high-grade gold intercepts confirm robustness of Melville Gold Deposit, Yalgoo Project

Outstanding new intercepts of 22m @ 5.36g/t including 5m @ 17.50g/t and 1m @ 73.30g/t plus visible gold in panning with the next phase of drilling already underway

Key Points:

- Further strong results received from the remaining drill-holes completed as part of the second phase of drilling at the Yalgoo Gold Project in WA, confirming the consistency, high-grade potential and shallow nature of the mineralisation within the Melville Gold Deposit.
- Significant new assay results include:
 - 50m @ 1.40g/t including 4m @ 5.20g/t and 5m @ 4.04g/t (FMRC0018);
 - 30m @ 1.23g/t including 6m @ 7.48g/t (FMRC0021);
 - 22m @ 5.36g/t incl. 5m @ 17.50g/t incl. 1m @ 73.30g/t (FMRC0031);
 - 17m @ 2.75g/t including 3m @ 7.48g/t (FMRC0033); and
 - 3m @ 5.89g/t including 1m @ 17.00g/t (FMRC0013).
- Substantial widths of gold mineralisation encountered in the latest drilling with intervals containing visible gold in panning up to 50m thick and the zones remaining open at depth and along-strike.
- Next phase of drilling already underway targeting an area up to 500m to the north along the main Melville trend to evaluate potential extensions to the historical (JORC 2004) mineral resource estimate.
- The next phase of resource extension drilling has the potential to significantly add to the upcoming Melville resource update due 1st quarter CY2021.

Firefly Resources Ltd (**ASX: FFR; Firefly or the Company**) is pleased to report outstanding new results from the second batch of assays received as part of the recently completed second phase of the planned 10,000m maiden drill program at its 100%-owned Yalgoo Gold Project in Western Australia (see Figure 1).

This announcement details results from the remaining 17 holes of the recently completed 24-hole Phase 2 Reverse Circulation (RC) drill program, with the results continuing to confirm the continuity and robustness of the gold mineralisation within the shallow Melville Gold Deposit, as well as the potential of the deposit to host significant high-grade zones.

A new program of RC drilling, representing the third phase of the planned 10,000m program, is already underway at Melville, targeting an area that extends to the north around 500m from the current mineralised position. This drilling has the potential to significantly add to the planned maiden JORC 2012 Mineral Resource Estimate (MRE) for the Melville Deposit resource update scheduled for Q1 CY2021.

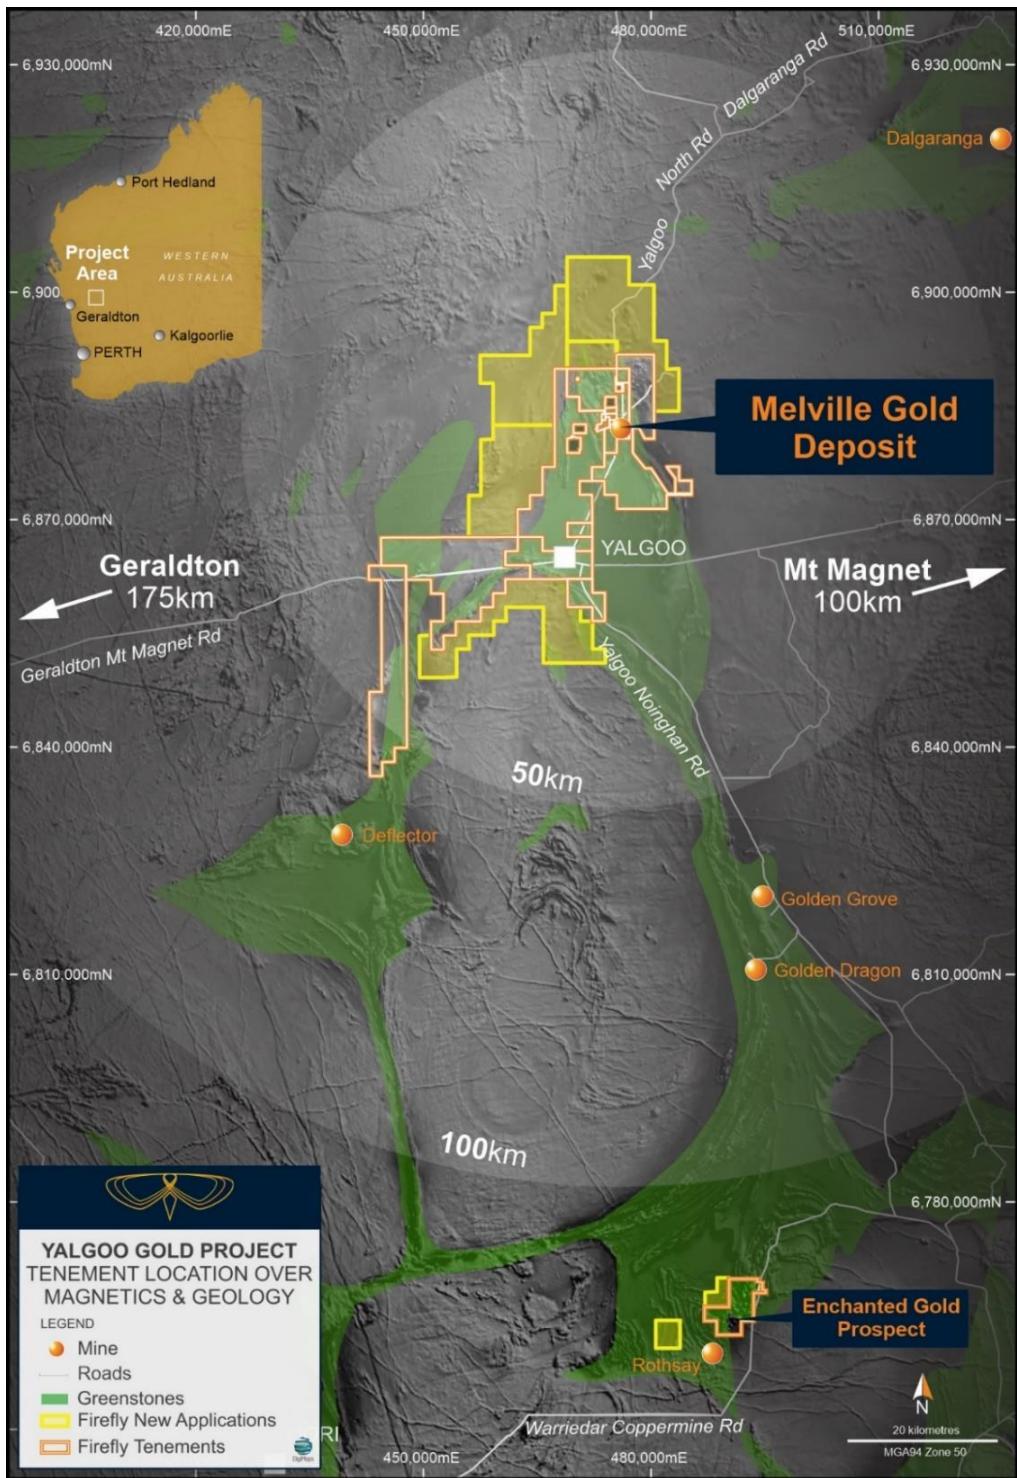

Figure 1. Firefly's Yalgoo Gold Project illustrating the Company's regional-scale tenure and new applications across the under-explored Yalgoo-Singleton greenstone belt as well as proximity to multiple gold-specific and gold-capable process plants.

The 17 RC drill-holes detailed in this announcement were all drilled in and around the historical (JORC 2004) Melville Gold Deposit resource outline (Figure 2), further reinforcing the shallow high-grade gold mineralisation seen in previous holes as well as increasing the Company's knowledge and understanding of the deposit geology and structural architecture.

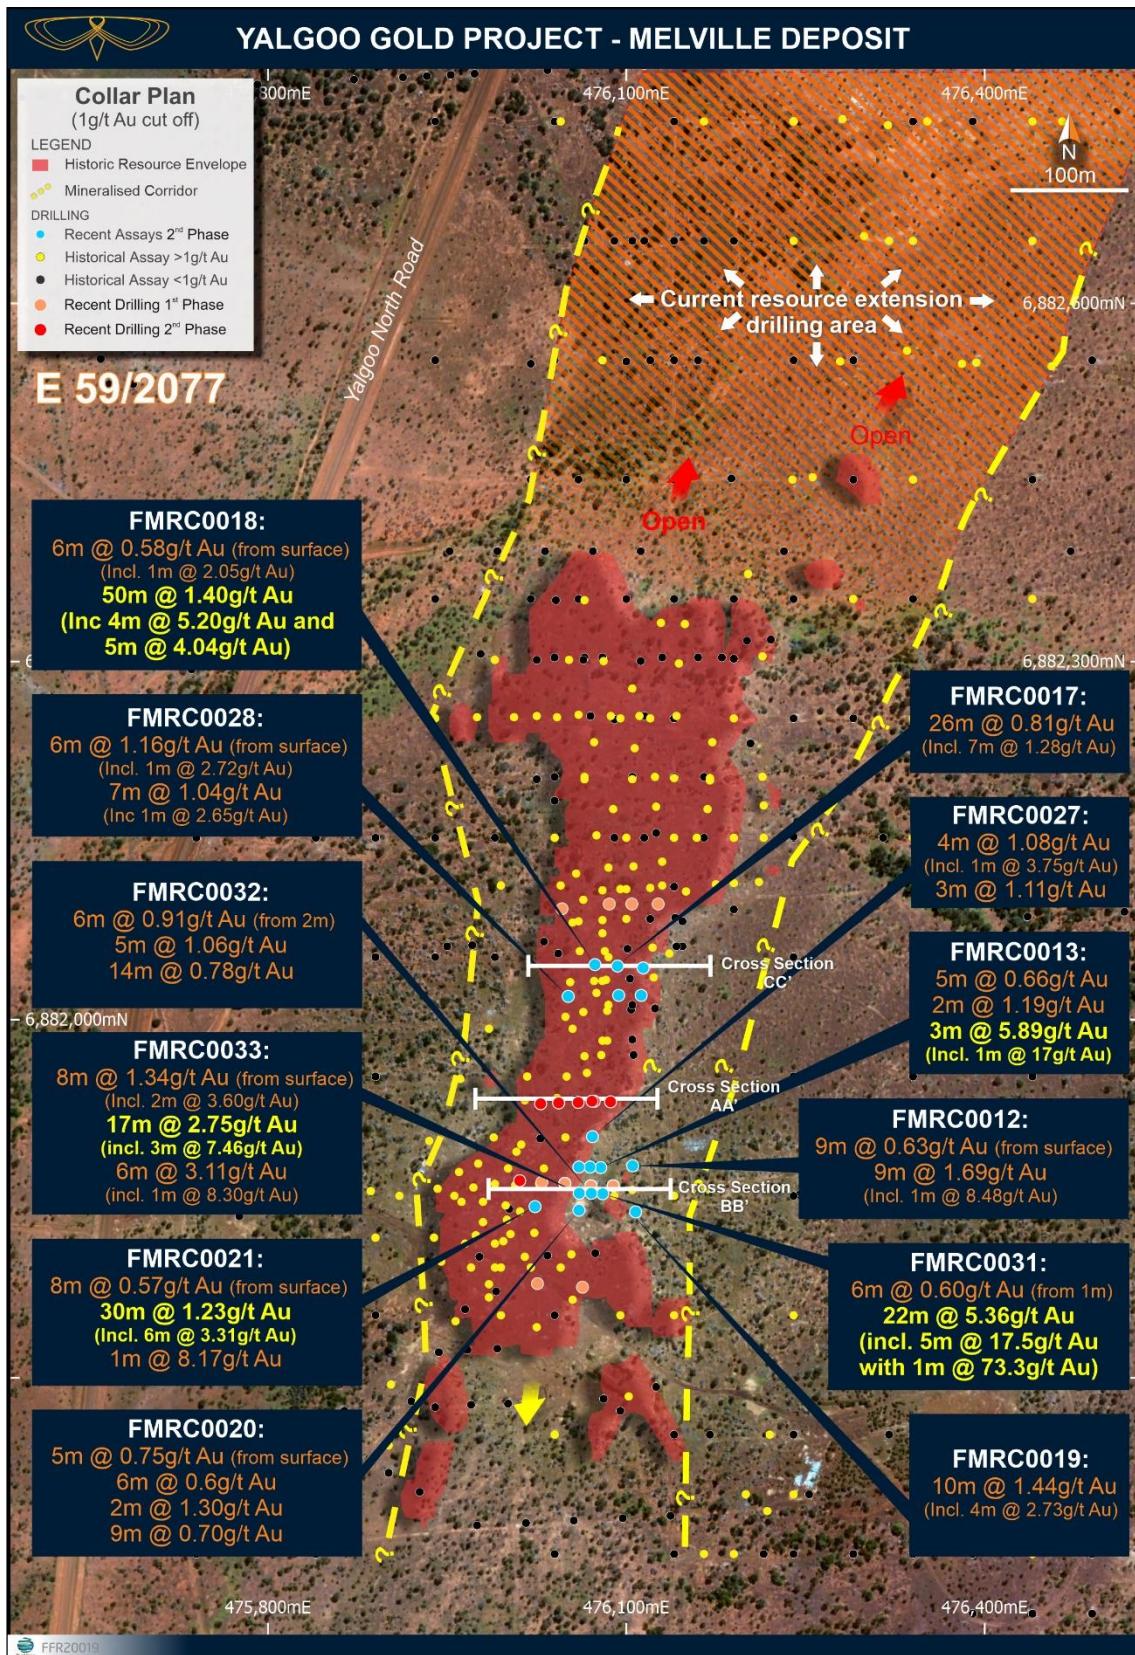

Figure 2. Plan view of the Melville Gold Deposit with historical drilling, recent Firefly RC drill-hole locations and highlighting the potential northern extensional area. Note that section "CC" is shown in Figure 3.

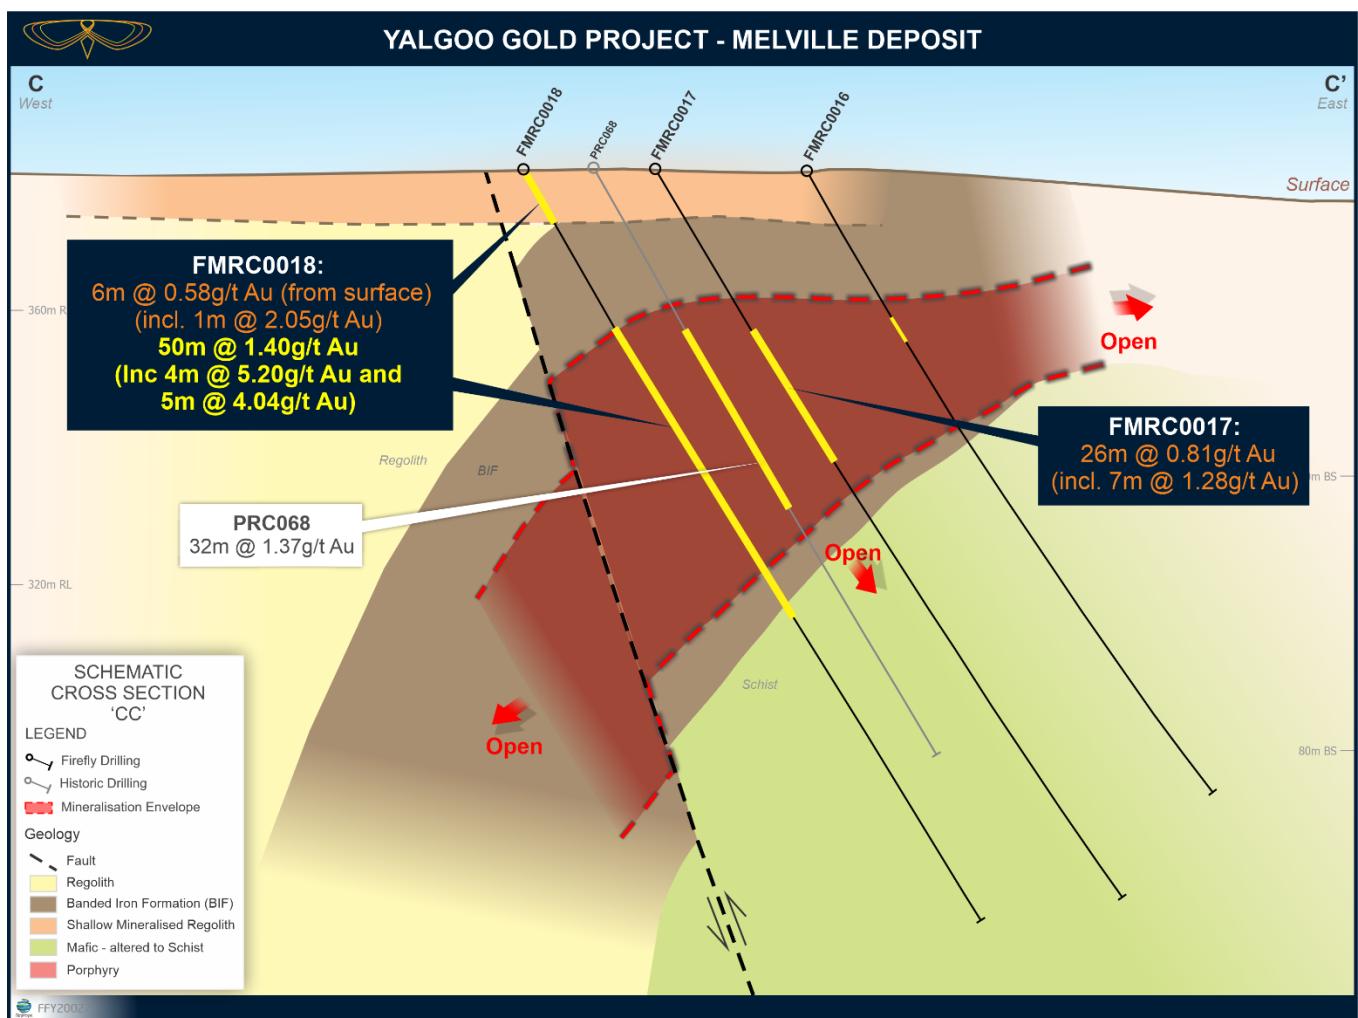

Figure 3. Cross-section "CC" through the Melville Gold Deposit illustrating the consistent geological units and thick shallow gold intercepts.

Management Comment

Firefly Managing Director, Simon Lawson, said: "We have completed systematic drill test of areas that we believed were more "at-risk" in the historical Melville resource estimate when we acquired the project. While producing some spectacular gold results along the way, this drilling within the main resource area has strongly validated the historical data used in the previous estimate, giving us a high level of confidence in the previous estimate."

"The next phase of drilling, currently underway, is designed to significantly increase the footprint of mineralisation by targeting an area up to 500m to the north and along-strike from Melville. We have established an excellent foundation at Melville in our previous two phases of drilling, and it's now time to step out and see how big we can grow our key gold asset at Yalgoo"

"Our small team is out there consistently generating results and testing the value proposition represented by Melville right now. We are really excited about what we are seeing in these latest drill-holes and have a schedule of targets along-strike from Melville as well as across the multiple proven mineralised trends in the wider Yalgoo Gold Project. Our shareholders are in for a great ride!"

Competent Persons Statement

The information in this announcement that relates to Exploration Targets, Exploration Results, Mineral Resources or Ore Reserves is based on information reviewed, collated and compiled by Mr Simon Lawson, a full-time employee and the Managing Director of Firefly Resources Ltd. Mr Lawson is a professional geoscientist and Member of The Australian Institute of Mining and Metallurgy and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration, and to the activity which has been undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results, Mineral Resources, and Ore Reserves. Mr Lawson consents to the inclusion in this announcement of the matters based on this information in the form and context in which it appears.

Annexure C

JORC TABLE 1 Section 1 Sampling Techniques and Data

Criteria	JORC Code Explanation	Commentary
<i>Sampling techniques</i>	<p><i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down-hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></p>	<p><u>Current RC drill program</u></p> <p>All Reverse Circulation ('RC') samples consist of 1m primary sample calico bags taken directly off the cyclone splitter. Due to the nature of the Melville mineralisation being comprised of shallow oxide, transition, and fresh primary mineralisation it was decided that this sampling methodology was an efficient and low risk approach.</p> <p>Historical sampling criteria is unclear for pre 2008 drilling.</p> <p>FFR sampling is undertaken using standard industry practices including the use of duplicates, standards and blanks at regular intervals. All RC samples are split to 1-3kg in weight through the cyclone splitter on the drill rig for 1m drill intervals. A Thermo Scientific Niton GoldD XL3+ 950 Analyser is available on site to aid geological interpretation. No pXRF results are reported.</p>
	<p><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></p>	<p>All co-ordinates are in UTM grid (GDA Zone 50). All drill hole collars are to be surveyed professionally on a campaign basis to an accuracy of 0.5 m. Initially all holes are picked up by the geologist with an accuracy of ± 2m.</p>
	<p><i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine</i></p>	<p><u>Current RC drill program</u></p> <p>No compositing was conducted. The ~2-3kg primary samples were pulverised to produce a 500g charge for ore grade Au by accelerated cyanide leach using Assay Tabs/LeachWELL™ 60x reagent and AAS for a total of 4-hour leach (Au-AA15). All results equal to or greater than 0.5g/t are determined by AAS from a 50g fire assay performed on a cyanide leach residue (Au-AA26R) These protocols were used to deliver a preliminary understanding of total gold content and potential CIL plant recovery. Screen fire assay (Au-SCR22AA)</p>

	<p><i>nodules) may warrant disclosure of detailed information.</i></p>	<p>and gravimetric (Au-GRA22) protocols are undertaken on select high grade gold samples.</p> <p>All 1m samples are split to 1-3kg in weight through a cyclone splitter which is air blasted clean at the end of each rod. Individual samples weigh less than 3kg to ensure total preparation at the laboratory pulverisation stage. The sample size is deemed appropriate for the grain size of the material being sampled. Samples are sent to ALS Laboratories in Wangara where they are prepared and analysed using Au-AA15 (Lower limit of 0.01g/t Au and upper limit of 300g/t Au). Where high grade gold is noted, a blank quartz wash is inserted between and after bottle rolls to prevent contamination.</p>
<i>Drilling techniques</i>	<p><i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></p>	<p>RC drilling was used in this FFR program. Strike Drilling Pty Ltd utilised a slimline RC Truck Mounted Rig with a SAT04 Auxiliary and Booster and a 5.5" face sampling hammer.</p> <p>Down hole surveys were undertaken at a maximum of 30m intervals using a north seeking gyroscopic tool not subject to magnetic interference.</p> <p>A total of 34 RC holes has now been drilled by FFR at Melville.</p> <p>Historical RAB, AC, RC and DD drilling has been undertaken by several companies over a period of 30 years.</p>
<i>Drill sample recovery</i>	<p><i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></p>	<p><u>Current RC drill program</u></p> <p>RC 1m primary samples are collected and assayed. Any high grade or bonanza grades are isolated, and duplicate sampled for reliability. Sample weights, dryness and recoveries are observed and noted in a field Toughbook computer by FFR field staff.</p>
	<p><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></p>	<p>FFR contracted drillers use industry appropriate methods to maximise sample recovery and minimise downhole contamination including using compressed air to maintain a dry sample in RC drilling. A cyclone splitter was utilised to split 1-3kg of sample by weight. The splitter was air blasted clean at the end of each rod.</p> <p>Historical sampling recovery is unclear for pre 2008 drilling.</p>

	<i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	No significant sample loss or bias has been noted in current drilling or has been found in historical exploration reports.
<i>Logging</i>	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i>	All geological, structural and alteration related observations are stored in the database.
	<i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i>	Lithology, structure, alteration, mineralisation, weathering, colour, and any other important features of RC drill chips have been logged on a 1 m basis or in specific composite intervals.
	<i>The total length and percentage of the relevant intersections logged.</i>	All drill holes were logged in full on completion.
<i>Subsampling techniques and sample preparation</i>	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	Not applicable to this announcement.
	<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i>	Every 1 m RC interval was sampled dry as a bulk calico primary bag taken off the cyclone.
	<i>For all sample types, the nature, quality, and appropriateness of the sample preparation technique.</i>	Drill sample preparation and precious metal analysis if undertaken by a registered laboratory (ALS). Sample preparation is by dry pulverisation to 85% passing 75 micron.
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	FFR field QAQC procedures involve the use of certified standards (1:40), blanks (1:40) and duplicates at appropriate intervals for early stage exploration programs. High, medium and low gold standards are used. Historical QAQC procedures are unclear for pre 2008 drilling.
	<i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i>	Sampling is carried out using standard protocols and QAQC procedures as per industry practice. Duplicate samples are taken (~1:40) and more frequently when in prospective zones of mineralisation. They are routinely checked against the originals at the end of each program.
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	Sample sizes are considered appropriate for grain size of sample material to give an accurate indication of gold mineralisation.

<i>Quality of assay data and laboratory tests</i>	<p><i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></p>	<p>On 1m cyclone split samples, analysis is undertaken by ALS laboratories (a registered laboratory), with Assay Tabs/LeachWELL™ 60x reagent and AAS for a total of 4-hour leach (Au-AA15). A screen fire assay is undertaken on select high-grade gold samples.</p> <p>Internal certified laboratory QAQC is undertaken including check samples, blanks and internal standards. This methodology is considered appropriate for gold mineralisation at the exploration stage.</p>
	<p><i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></p>	<p>No geophysical tools were used to estimate mineral or element percentages. Firefly uses a Thermo Scientific Niton GoldD XL3+ 950 Analyser to aid geological interpretation.</p>
	<p><i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i></p>	<p>FFR field QAQC procedures involve the use of certified reference standards (1:40), duplicates (~1:30) and blanks (1:40) at appropriate intervals for early stage exploration programs. Historical QA/QC procedures are unclear for pre 2008 drilling.</p>
<i>Verification of sampling and assaying</i>	<p><i>The verification of significant intersections by either independent or alternative company personnel.</i></p>	<p>FFR samples are verified by the geologist before importing into the main FFR database (Microsoft Access). High-grade coarse gold related samples were managed and validated by laboratory staff in conjunction with company personnel.</p>
	<p><i>The use of twinned holes.</i></p>	<p>No twin holes were drilled during this program.</p>
	<p><i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i></p>	<p>Primary data is collected using a standard set of templates. Geological sample logging is undertaken on one metre intervals for all RC drilling with colour, structure, alteration, and lithology recorded for each interval. Data is verified before loading to the database. Geological logging of all samples is undertaken.</p>
	<p><i>Discuss any adjustment to assay data.</i></p>	<p>For 3D modelling purposes any intersects reported by the lab as <0.01 g/t Au are normalised to 0.00 g/t Au.</p>
<i>Location of data points</i>	<p><i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i></p>	<p>All maps and location data are in UTM grid (GDA 94 Zone 50) and historical drill hole collars have been surveyed or measured by hand-held GPS with an accuracy of ± 2m. Down hole surveys are</p>

		undertaken using the axis digital clinometer and gyroscope down hole tool at regular 30m intervals.
	<i>Specification of the grid system used.</i>	All historical drill hole and sample co-ordinates have been normalised in the database to UTM grid (GDA94 Zone 50). Transformations were conducted from local grids where necessary for historical data sets.
	<i>Quality and adequacy of topographic control.</i>	All current and historical drill hole collars and RL's are surveyed by qualified surveyors in most instances in the resource areas post drilling. Drill hole collars are planned and set up using standard GPS with an accuracy of ± 2m.
<i>Data spacing and distribution</i>	<i>Data spacing for reporting of Exploration Results.</i>	Variable drill hole spacings are used to adequately test targets and are determined from geochemical, geophysical and geological data together with historical drilling information. At the centre of the Melville ore body, a general grid of 20m drill spacings on 10-25m spaced lines was completed over multiple drill campaigns. Current drilling is planned at variable spacing to both infill (20m spacing) and extend the current resource (50-75 m spaced fence lines at 100-150 m depths).
	<i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i>	There is a JORC 1999 Mineral Resource at Melville defined by Prosperity Resources and reported to the ASX in 2004 above a cut-off grade of 1.0g/t Au. The indicated category contains 1,251,400 tonnes at a grade of 1.83g/t for a total of 75,377 oz Au. The inferred category contains 692,900 tonnes at a grade of 1.87g/t for a total of 41,740 oz Au. The relevant document is publicly available via the WAMEX database as report A74013. For further details refer to FFR ASX announcement 24 th June 2020, "Transformational Acquisition of Yalgoo Gold Project, WA".
	<i>Whether sample compositing has been applied.</i>	All current exploration drilling at Melville is being conducted on a 100% non-composite basis to facilitate assay data efficiency (eliminate field resampling), reliable mineralisation control interpretations and high confidence in resource estimations.

<i>Orientation of data in relation to geological structure</i>	<p><i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i></p>	<p>Most historical drill holes at the Melville deposit were drilled at a dip of -60 degrees and an azimuth of 090. The mineralisation is interpreted to dip between 45-60 degrees and striking NNE. The true width of historical intercepts is interpreted to be >75% of the drill intersection width. All current drilling is being undertaken at the same orientation for consistency and validation purposes.</p>
	<p><i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></p>	<p>No orientation-based sampling bias is known at this time.</p>
<i>Sample security</i>	<p><i>The measures taken to ensure sample security.</i></p>	<p>Chain of custody is managed by FFR internal staff. Drill samples are stored on site and transported by a licenced reputable transport company to a registered laboratory in Perth (ALS Laboratories in Wangara). When at the laboratory samples are stored in a locked yard before being processed and tracked through preparation and analysis (Webtrieve system).</p>
<i>Audits or reviews</i>	<p><i>The results of any audits or reviews of sampling techniques and data.</i></p>	<p>The JORC 1999 Melville resource has been externally reviewed by Entech Mining Consultants as a part of the Firefly Resources acquisition due diligence. Entech outlined that independent validation of the block model and review of volume delineation and grade estimation identified no fatal flaws with respect to the Mineral Resource Estimate ('MRE') at the Melville Deposit.</p>

JORC TABLE 1

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<p><i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i></p> <p><i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i></p>	<p>The Melville gold deposit is located on E59/2077.</p> <p>The Yalgoo project tenements consist of 16 licences. The tenements are partially subject to standard Native Title heritage agreements and state royalties. Third party royalties are present on some individual tenements.</p> <p>The Lady Lydia/Brilliant, Don Bradman and Prince George prospects are located on tenements E59/2077 and E59/2140. The Enchanted prospect is located on E59/2230.</p> <p>The Holland acquisition includes several gold prospects that cover P59/2134 (Continental), P59/2087, M59/0384, P59/2086 and M59/0358 (St Michaels, Xmas Box and Grey Cat). The tenements are in good standing and no known impediments exist.</p>
<i>Exploration done by other parties</i>	<i>Acknowledgment and appraisal of exploration by other parties.</i>	Historical drilling, surface sampling, soil sampling and geophysical surveys have been undertaken in different areas within the tenements intermittently by multiple third parties over a period of ~30 years.
<i>Geology</i>	<i>Deposit type, geological setting, and style of mineralisation.</i>	Geology comprises typical Archaean greenstone belt lithologies and granitic intrusions. The main style of mineralisation present is Yilgarn Archaean lode gold. Currently identified rock type hosts include: Channel Iron Deposit/Clay, Banded Iron Formation, Quartz Feldspar Porphyry, Amphibolite/Basalt & Mafic Schist.
<i>Drill hole Information</i>	<p><i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole, down hole length and interception depth, hole length.</i></p>	<p>RC drill hole collars with assays received and collated for the current drill program at Melville are reported in this announcement.</p> <p>All relevant historical drill hole information has previously been reported by Chevron Exploration, Johnson's Well Mining NL, Roebuck Resources NL, Acacia Resources, Prosperity Resources, and various other companies over the years. It is publicly available in the Department of Mines and Petroleum's WAMEX open file database.</p>

<i>Data aggregation methods</i>	<p><i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i></p>	<p>Significant assay intervals are generally recorded above 0.3/t Au. No cut-off has been applied to any sampling.</p>
	<p><i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></p>	<p>No cut-off has been applied to any sampling. Reported intervals are generally aggregated using individual assays above 0.3g/t Au with no more than 2m of internal dilution <0.1g/t Au for any interval.</p>
	<p><i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></p>	<p>Not applicable to this announcement.</p>
<i>Relationship between mineralisation widths and intercept lengths</i>	<p><i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill-hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i></p>	<p>True widths are not confirmed however drilling is planned perpendicular to interpreted targets.</p>
<i>Diagrams</i>	<p><i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i></p>	<p>Drill collar locations are in Annexure A of this release and a relevant geological section with grade to represent the Melville high-grade parallel lode discovery has been provided in this announcement.</p>
<i>Balanced reporting</i>	<p><i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i></p>	<p>A complete down hole assay suite of the drill holes referenced in this announcement has been included, see Annexure B. All down hole grades have been shown.</p>

<i>Other substantive exploration data</i>	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	All material results from geochemical and geophysical surveys and drilling, related to these prospects has been reported or disclosed previously.
<i>Further work</i>	<i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step out drilling).</i>	Further exploration is being planned by Firefly Resources using the acquisition database. The priority is to convert the Melville gold deposit into a maiden JORC 2012 compliant resource and to further grow the resource base across the entire Yalgoo project.
	<i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	Refer to figures in the body of this announcement.
