

DOOLGUNNA DRILLING PROGRESS REPORT

Key Points

- First hole of five-hole program completed at 502 metres depth.
- Shales with minor pyrite/pyrrhotite at 400 metres depth interpreted as weak conductor.
- Initial interpretation that first hole was on the margin of sulphide target.
- Next holes planned to test directly beneath the centre of mapped copper-zinc anomalous surface gossan zone.

Summary

Western Australian focussed mineral explorer Strickland Metals Limited (ASX:STK) ("Strickland" or "the Company") provides an update on the progress of drilling activities at its Doolgunna Project. The first diamond drill hole DGDD001 has now been completed at 502.2 metres depth.

Initial Observations

The diamond drill hole was designed as a stratigraphic hole to test a conductor interpreted from a fixed loop ground electro-magnetic survey at a depth of around 350 to 400 metres depth. The hole was located where it was believed the 3-kilometre long conductor was stronger at a shallower depth (Figure 1). At the target depth a sequence of turbiditic sediments including interbedded siltstones and shales with up to 5% pyrite and pyrrhotite was intersected which may explain the conductor in this drill hole.

The mapped gossan that contains anomalous copper and zinc values at surface was not intersected in this first drill hole. Confirmatory mapping of the gossan over the last weekend has suggested that the first hole was sited at the northern extent of the gossan, which may explain why the interpreted sulphide body has not been intersected (Figure 1), (refer ASX release 20 July 2020).

Downhole electro-magnetic surveying will be completed on DGDD001 to assist interpretation of the geological and geophysical results.

Core is currently being cut and sampled and assay results are expected in early January 2021.

Next Steps

The next stage of drilling will see two new holes sited directly under the central part of the mapped copper-zinc anomalous gossan. The target depth of the first hole will be approximately 180 metres, and the second around 300 metres (see Figures 2 and 3). Drilling is ongoing at site.

Exploration Results

Information in this report which relates to Exploration Results is based on information compiled by Andrew Viner, a Director of Strickland Metals Limited and a Member of the Australasian Institute of Mining and Metallurgy, Mr Viner has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves." Mr Viner consents to the inclusion in the report of the matters based on this information in the form and context in which it appears. Mr Viner is a shareholder and option holder of Strickland Metals Limited.

The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and that the form and context in which the Competent Person's findings are presented have not materially changed from the original market announcement.

APPENDIX 2

JORC Code, 2012 Edition – Table 1 Section 1 Sampling Techniques and Data (Criteria in this section apply to all succeeding sections.)

| Criteria | JORC Code explanation | Commentary |
|------------------------|---|--|
| Sampling techniques | Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. | Not reporting on assaying or sampling – not required |
| Drilling techniques | Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face- sampling bit or other type, | Strickland Metals drilling is completed using industry standard practices. RC drilling for diamond pre-collars is completed using a face sampling hammer of nominal 140mm. Diamond drilling is completed using HQ3 and HQ size coring equipment. Core e orientation completed using a REFLEX tool |

| Criteria | JORC Code explanation | Commentary |
|--|--|---|
| | whether core is oriented and if so, by what method, etc). | Core is oriented using Boart Longyear core orientation device – TruCore All drill collars are surveyed using handheld Garmin Montana 610 GPS, with +/- 3m accuracy. |
| Drill sample recovery | Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. | Strickland Metals core is depth marked and orientated to check against the driller's blocks, ensuring that all core loss is taken into account. Diamond core recovery is logged and captured into the database. Not being reported. Not being reported. |
| Logging | Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. | All RC and Diamond samples have been geologically logged. Not being reported All cores are digitally photographed and stored. |
| Sub-sampling techniques and sample preparation | If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of | Not being reported |

| Criteria | JORC Code explanation | Commentary |
|--|--|--|
| | the in situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. | |
| Quality of assay data and laboratory tests | The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. | Not being reported or previously reported |
| Verification of sampling and assaying | The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. | Not being reported. |
| Location of data points | Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. | Drill collars were pegged using a Garmin Montana GPS 610 unit and are considered accurate to +/- 3m. The grid system used is the Geocentric Datum of Australia GDA94. Coordinates are in the Map Grid of Australia Zone 50 (MGA) The project area is flat lying with topographic control provided by the GPS and government topographic maps at 1:100,000 scale. |

| Criteria | JORC Code explanation | Commentary |
|---|--|--|
| | Quality and adequacy of topographic control. | |
| Data spacing and distribution | Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. | Drill spacing at the Doolgunna Project was on 400m line spacing as first pass drilling. No mineral resource is being reported for the Doolgunna Project |
| Orientation of data in relation to geological structure | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralized structures is considered to have introduced a sampling bias, this should be assessed and reported if material. | Drilling was conducted -60 degrees to 310 degrees. The drill holes may not be exactly perpendicular to the interpreted FLEM plate model and interpreted geology. No previous drilling has been completed in the area to be able to determine orientation of stratigraphy. Drill holes are positioned using the outcropping stratigraphy and interpreted FLEM plates as a guide to possible underlying stratigraphy |
| Sample security | The measures taken to ensure sample security. | Not being reported |
| Audits or reviews | The results of any audits or reviews of sampling techniques and data. | None undertaken at this stage |

Section 2 Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.)

| Criteria | JORC Code explanation | Commentary | |
|--|---|---|--|
| Mineral tenement and land tenure status | Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any | The Doolgunna Project lies within tenement E52/3495 held by Diversified Asset Holdings with Strickland Metals having the option to purchase 80% of the tenement. The project is located ~125km North of Meekatharra, Western Australia. The tenement is current and in good standing. | |

| Criteria | JORC Code explanation | Commentary |
|---|---|---|
| | known impediments to obtaining a licence to operate in the area. | |
| Exploration done by other parties | Acknowledgment and appraisal of exploration by other parties. | Limited exploration has been conducted in the area. Soil sampling has been conducted by Peak Resources produced a copper-zinc anomaly which is coincident with Strickland Metals mapping of an iron rich gossan. Historical EM surveys partially covered the copper-zinc gossan |
| Geology | Deposit type, geological setting and style of mineralisation. | Strickland Metals Doolgunna Project lies along the northern edge of the Bryah Basin and contains what has recently been interpreted as the Karalundi formation. The Karalundi formation hosts the VMS style mineralisation of the De Grussa copper-gold mine. |
| Drill hole Information | A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. | Reported previously. |
| Data aggregation methods | In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high- | Not being reported. |

| Criteria | JORC Code explanation | Commentary | |
|--|---|---|--|
| | grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. | | |
| Relationship between mineralisatio n widths and intercept lengths | These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known'). | Drilling is carried out at right angles to interpreted targeted structures where possible. The geometry of the mineralisation relative to the drill hole is unknown at this stage. | |
| Diagrams | Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. | The Company has released various maps, figures and sections showing the sample results and planned drill holes. | |
| Balanced reporting | Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced avoiding misleading reporting of Exploration Results. | Not being reported The accompanying document is considered to represent a balanced report. | |
| Other substantive exploration data | Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples — size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. | As previously reported. Further data collection will be reviewed and reported when considered material. | |

| Criteria | JORC Code explanation | Commentary |
|--------------|---|--|
| Further work | The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. | Planned future work at the Doolgunna Project includes RC and continued deep Diamond drilling. DHEM surveys are planned on selected Diamond drill holes to further define areas of interest. |
