## **PROGRESS AT THE GLENVIEW BASEMETAL PROJECT**

The board of Hampton Hill Mining NL is pleased to announce the commencement of the planned detailed ground electromagnetic geophysical survey.

The survey seeks to define massive sulphides along a target horizon that extends for over 10 kilometres within acid volcanics understood to be of the same age as and of similar geology to the sequences that host the Golden Grove base metal ore bodies located in the Yalgoo Goldfield, located some 100 kilometres to the south. The horizon has been outlined by an extensive wide-spaced bedrock drilling program that demonstrated a clear base metal anomalous trend along its length.

Results of the survey should be known later this quarter.
