

# Discovery of a second trend of mineralisation at Hualilan with 126m at 1.1 g/t Au including 71m at 1.7 g/t Au

# **Highlights**

- Significant mineralisation in all three drill holes designed to test the first conceptual target from CEL's recent geophysics comprising ground magnetics and IP (induced polarisation).
- The holes were drilled in an area with no outcrop or previous drilling. All three holes intersected broad zones of mineralisation with results including (Refer Table 1):
  - 125.5m at 1.1 g/t AuEq<sup>2</sup> 1.1 g/t Au, 3.6 g/t Ag, 0.1% Zn from 208.0m including; 71.0m at 1.8 g/t AuEq<sup>2</sup> - 1.7 g/t Au, 6.0 g/t Ag,0.2% Zn from 208.0m including; 29.0m at 4.0 g/t AuEq<sup>2</sup> - 3.7 g/t Au, 12.5 g/t Ag, 0.3% Zn, from 228.8m and 28.8m at 1.7 g/t AuEq<sup>2</sup> - 1.5 g/t Au, 1.2 g/t Ag, 0.3% Zn from 152.0m including; 4.8m at 9.2 g/t AuEq<sup>2</sup> - 8.4 g/t Au, 5.3 g/t Ag, 1.5% Zn from 176.0m including; 0.75m at 57.4 g/t AuEq<sup>2</sup> - 52.5 g/t Au, 33.2 g/t Ag, 9.6 Zn from 180.05m (GNDD-169);
  - mineralisation over 140 metres across a number of domains in GNDD-164 including;
     22m at 0.5 g/t AuEq<sup>2</sup> 0.4g/t Au, 0.8g/t Ag, 0.1% Zn from 136m and
     10.0m at 0.5 g/t AuEq<sup>2</sup> 0.5 g/t Au, 0.2 g/t Ag, 0.0% Zn from 171m and
     37.0m at 1.0 g/t AuEq<sup>2</sup> 0.8g/t Au, 2.1g/t Ag, 0.5% Zn from 239m including;
     4.5m at 6.5 g/t AuEq<sup>2</sup> 4.9 g/t Au, 14.9 g/t Ag, 3.4% Zn, from 239m (GNDD-164);
  - 45.0m at 0.5 g/t AuEq<sup>2</sup> 0.4g/t Au, 1.7g/t Ag, 0.3% Zn from 93m including;
     3.0m at 1.6 g/t AuEq<sup>2</sup> 1.3 g/t Au, 7.9 g/t Ag, 0.5% Zn from 101m including;
     1.7m at 2.2 g/t AuEq<sup>2</sup> 1.7 g/t Au, 3.7 g/t Ag, 0.9% Zn, from 125.2m (GNDD-163).
- This discovery is interpreted as a second north-south trend of mineralisation 200 metres west of the existing north-south trend of intrusive-hosted mineralisation in the Gap Zone.
- Exploration success in these first holes significantly upgrades a number of similar geophysical targets located under cover to the east and west of the existing mineralisation at Hualilan.

# Commenting on the results, CEL Managing Director, Mr Kris Knauer, said

"Another great result from our Hualilan Gold Project, with the discovery of a repeat "Western Zone" of mineralisation, that appears to have similar dimensions to, and is located some 200 metres west of, the Gap Zone mineralisation. This demonstrates the untapped potential of the project.

That all three holes, drilled in an area completely under cover with no previous drilling, intersected significant mineralisation reminds me of our first holes to test the original intrusive-hosted discovery.

The fact that they were the first holes to test one of many similar conceptual targets generated by our surface magnetics and geophysics is even more encouraging. Hualilan keeps on delivering and expanding. It is an exciting time to be a Challenger Exploration shareholder."

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 653.1m shares 86.6m options 120m perf shares 16m perf rights

Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 **Directors** Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman

**Challenger Exploration (ASX: CEL) ("CEL"** the "**Company**") is pleased to announce the results from a series of three drillholes at Cerro Norte, which were designed to step-out to the west and test a target generated by the Company's recent geophysics program. The drill holes are located in an area of no outcrop and no previous drilling 200 metres west and 500 metres north of the currently defined mineralisation in the Gap Zone.

The holes were targeted using the Company's recent surface magnetics and IP (Induced Polarisation) test lines at Cerro Norte. The IP and magnetics indicated a possible second trend of intrusives under cover with the same north-south orientation as the Gap Zone mineralisation where recent drilling has returned intersections of 227.0 metres at 1.0 g/t AuEq, including 84.0 metres at 2.0 g/t AuEq (GNDD113A) and 209.0m at 1.1 g/t AuEq, including 49.0m at 3.0 g/t AuEq (GNDD-155).

Drillholes GNDD-163 (**45m at 0.5 g/t AuEq**), GNDD-164 (**117m at 0.5 g/t AuEq**) and GNDD-169 (**125.5m at 1.1 g/t AuEq** including **71.0m at 1.8 g/t AuEq**) all intersected significant widths of mineralisation hosted predominantly in intrusives. This is interpreted as a new trend of mineralisation that appears to have the same north-south orientation as, and is approximately 200 metres west of, the known zone of intrusive-hosted mineralisation in the Gap Zone (Figure 1).

This new "Western Zone" of mineralisation appears to have similar dimensions to the mineralisation in the Gap Zone being 50-100 metres wide and steeply dipping, however, it also extends into the overlying sedimentary rocks. Siltstone in the sedimentary sequence above the intrusives has been brecciated by the intrusion creating a second west dipping zone of mineralisation over 50 metres thick which is also a useful exploration guide to deeper intrusive-hosted mineralisation. The geophysics assists to define a target 400 metres long with the first three holes demonstrating strong mineralisation over the 100 metres of strike drilled.

This is the first of several similar geophysical targets to be drill tested and the results significantly upgrade the additional geophysical targets which are located both to the east and west of the existing mineralisation. Importantly, the IP and magnetics indicate the potential that this new zone and the existing zones of mineralisation in intrusives join to form one potentially much larger zone at depth.

# **DISCUSSION OF RESULTS**

# **GNDD-169**

GNDD-169 intersected mineralisation over more than 200 metres downhole in two main domains hosted in intrusives. The hole encountered an upper zone from 149-181m downhole which returned and intercept of **28.8 metres at 1.7 g/t AuEq (1.6 g/t gold, 1.2 g/t silver, 0.3 % zinc)**, including **0.75 metres at 57.4 g/t AuEq (52.5 g/t gold, 33.2g/t silver, 9.6% zinc)**. Then, separated by 28 metres of limestone, the hole intercepted a lower zone of **125.5 metres at 1.1 g/t AuEq (1.1 g/t gold, 3.6 g/t silver, 0.1% zinc)** from 208m including **71.0 metres at 1.8 g/t AuEq (1.7 g/t gold, 6.0 g/t silver, 0.3% zinc)** with a high-grade zone of **29.0 metres at 4.0 g/t AuEq (3.7 g/t gold, 12.5 g/t silver, 0.3% zinc)** from 208m.

GNDD-169 also encountered lesser mineralisation above these two zones of intrusive-hosted mineralisation in sandstones and shales which appear to have been brecciated by the intrusion. If both zones of mineralisation in intrusives and the overlying sediments are composited, including the dilution (barren limestone), GNDD-169 returned **213.5 metres of mineralisation at an average grade of 0.9 g/t AuEq** from 120 metres downhole. This demonstrates the significant scale of this new trend of mineralisation. The intersection between these two domains is a priority target for further drilling as the Company's experience is that high-grade mineralisation is often located on the boundaries between domains across the Hualilan Project.

Figure 2 - Cross Section Showing New Western Zone of mineralisation

# GNDD-164

GNDD-164 intersected mineralisation over 140 metres downhole primarily in intrusives but, similar to GNDD-169, the hole also encountered mineralisation in brecciated sandstones and shales directly above the intrusive hosted mineralisation. Intercepts were **22 metres at 0.5 g/t AuEq (0.4g/t gold, 0.8g/t silver, 0.1% zinc)** from 136m and **10.0 metres at 0.5 g/t AuEq from** 171m and **37.0 metres at 1.0 g/t AuEq (0.8g/t gold, 2.1g/t silver, 0.5% zinc)** from 239m including **4.5 metres at 6.5 g/t AuEq (4.9 g/t gold, 14.9 g/t silver, 3.4% zinc)** from 239m.

In addition to the reported intercepts the drill hole encountered lower grade mineralisation between, above, and below, the reported significant intercepts. The scale of the mineralisation is best represented by the bulk composite intercept from 136 to 253 metres of **117 metres at 0.5 g/t AuEq** 

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 653.1m shares 86.6m options 120m perf shares 16m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 **Directors** Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman

(**0.4 g/t gold, 0.8 g/t silver, 0.1 % zinc).** GNDD-164 and GNDD-169 were collared 50 metres apart along strike and follow up drilling is planned in both direction on section to extend mineralisation both up-dip and downdip.

# GNDD-163

Drillhole GNDD-163 encountered **45.0 metres at 0.5 g/t AuEq (0.4 g/t gold, 1.7 g/t silver, 0.3 % zinc)** from 93m including **3.0 metres at 1.6 g/t AuEq (1.3 g/t gold, 7.9 g/t silver, 0.5% zinc)** from 101m and **1.7 metres at 2.2 g/t AuEq (1.7 g/t gold, 3.7 g/t silver, 0.9% zinc)**, from 125.2m. The mineralisation intersected in GNDD-163 is hosted mainly in brecciated sediments with the hole encountering only 35 metres of intrusives.

It is believed that drill hole GNDD-163 intersected the upper domain of mineralisation in the brecciated siltstone which occurs above the intrusives. The intrusives, are interpreted to be down-dip to the west of GNDD-163 and under the sedimentary sequence. A series of drill holes collared to the west of GNDD-163 are planned to intersect the interpreted main part of the new trend of mineralisation.

## Magnetic and Geophysical data

Figure 3 shows an image of the analytical signal (AS) of the reduced to pole (RTP) ground magnetic survey in the vicinity of drill holes GNDD-169, GNDD-164, and GNDD-163 and south into the Gap Zone. The majority of the intrusive-hosted mineralisation in the Gap Zone, and also south at Cerro Sur, is located on the flanks of a positive magnetic anomaly. This is interpreted as demagnetisation by alteration of the intrusions associated with the mineralisation.

Drillholes GNDD-163, GNDD-164 and GNDD-169 were the first drillholes to test this conceptual target and were collared in an area of transported cover (up to 50m thick) where there has been no previous drilling. The conceptual target tested by GNDD-163, GNDD-164, and GNDD-169 covers at least 400 metres of north-south strike with potential repeats indicated directly to the west under cover.

Additionally, the 20 km<sup>2</sup> of ground magnetics acquired by CEL defines several similar anomalies further east and west of the existing trend of mineralisation which are yet to be tested. The results of GNDD-163, GNDD-164, and GNDD-169 significantly upgrade these targets. In light of the initial exploration success, the Company will rank all of the targets based on the ground magnetics prior to dedicating one of the five rigs on site to test these targets.

IP data was collected on the western flank of the hills at Cerro Norte to test the technique at Hualilan. The mineralised intrusion intersected in GNDD-169 and GNDD-164 presents as a chargeability high on the IP as does the mineralisation intersected at the Gap Zone. This is possibly due to the presence of disseminated and vein-hosted sulphide in the intrusion. The combined IP and magnetic data suggest that the intrusive intersected in drilling to date at the Hualilan Gold project is part of a much larger intrusive system. This opens the possibility that this new Western Zone, and the existing zone of mineralisation in the Gap Zone and at Magnata, could join to form one potentially much larger zone at depth. IP coverage will now be extended to cover the remainder of Hualilan.

### Table 1: New intercepts reported.

See below for information regarding AuEq's reported under the JORC Code.

#### <sup>2</sup> Gold Equivalent (AuEq) values - Requirements under the JORC Code

- Assumed commodity prices for the calculation of AuEq is Au US\$1780 Oz, Ag US\$24 Oz, Zn US\$2,800 /t
- Metallurgical recoveries for Au, Ag and Zn are estimated to be 89%, 84% and 79% respectively (see JORC Table 1 Section 3 Metallurgical assumptions) based on metallurgical test work.
- The formula used: AuEq (g/t) = Au (g/t) + [Ag (g/t) x (24/1780) x (0.84/0.89)] + [Zn (%) x (28.00\*31.1/1780) x (0.79/0.89)]
- CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

# **About Challenger Exploration**

Challenger Exploration Limited's(ASX: CEL) aspiration is to become a globally significant gold producer. The Company is developing two complementary gold/copper projects in South America. The strategy for the Hualilan Gold project is for it to provide a high-grade low capex operation in the near term. This underpins CEL with a low risk, high margin source of cashflow while it prepares for a much larger bulk gold operation in Ecuador.

- 1. **Hualilan Gold Project**, located in San Juan Province Argentina, is a near term development opportunity. It has extensive historical drilling with over 150 drill-holes and a non-JORC historical resource <sup>(1)</sup> of 627,000 Oz @ 13.7 g/t gold which remains open in most directions. The project was locked up in a dispute for the past 15 years and as a consequence had seen no modern exploration until CEL acquired the project in 2019. Results from CEL's first drilling program included 6.1m @ 34.6 g/t Au, 21.9 g/t Ag, 2.9% Zn, 6.7m @ 14.3 g/t Au, 140 g/t Ag, 7.3% Zn and 10.3m @ 10.4 g/t Au, 28 g/t Ag, 4.6% Zn. This drilling intersected high-grade gold over almost 2 kilometres of strike and extended the known mineralisation along strike and at depth in multiple locations. Recent drilling has demonstrated this high-grade skarn mineralisation is underlain by a significant intrusion-hosted gold system with intercepts including 116m at 1.0 g/t Au, 4.0 g/t Ag, 0.2% Zn and 39.0m at 5.5 g/t Au, 2.0 g/t Ag, 0.3% Zn in porphyry dacites. CEL's current program includes 45,000 metres of drilling, metallurgical test work of key ore types, and an initial JORC Compliant Resource and PFS.
- 2. El Guayabo Gold/Copper Project covers 35 sqkms in southern Ecuador and was last drilled by Newmont Mining in 1995 and 1997 targeting gold in hydrothermal breccias. Historical drilling has demonstrated potential to host significant gold and associated copper and silver mineralisation. Historical drilling has returned a number of intersections including 156m @ 2.6 g/t Au, 9.7 g/t Ag, 0.2% Cu and 112m @ 0.6 % Cu, 0.7 g/t Au, 14.7 g/t which have never been followed up. The Project has multiple targets including breccia hosted mineralisation, an extensive flat lying late stage vein system and an underlying porphyry system target neither of which has been drill tested. CEL's first results confirm the discovery of large-scale gold system with over 250 metres of bulk gold mineralisation encountered in drill hole ZK-02 which contains a significant high-grade core of 134m at 1.0 g/t gold and 4.1 g/t silver including 63m at 1.6 g/t gold and 5.1 g/t silver.

<sup>#1</sup> For details of the foreign non-JORC compliant resource and to ensure compliance with LR 5.12 please refer to the Company's ASX Release dated 25 February 2019. These estimates are foreign estimates and not reported in accordance with the JORC Code. A competent person has not done sufficient work to clarify the foreign estimates as a mineral resource in accordance with the JORC Code. It is uncertain that following evaluation and/or further exploration work that the foreign estimate will be able to be reported as a mineral resource. The company is not in possession of any new information or data relating to the foreign estimates or CEL's ability to verify the foreign estimates estimate as minimal resources in accordance with Appendix 5A (JORC Code). The company confirms that the supporting information provided in the initial market announcement on February 25, 2019 continues to apply and is not materially changed.

### **Competent Person Statement – Exploration results**

The information that relates to sampling techniques and data, exploration results and geological interpretation has been compiled Dr Stuart Munroe, BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

### **Competent Person Statement – Foreign Resource Estimate**

The information in this release provided under ASX Listing Rules 5.12.2 to 5.12.7 is an accurate representation of the available data and studies for the material mining project. The information that relates to Mineral Resources has been compiled by Dr Stuart Munroe, BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe and has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration to qualify as Competent Person as defined in the 2012 Edition of the JORC Code for Reporting of, Mineral Resources and Ore Reserves. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

	<ul> <li>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	and pulverized to 85% passing 75 $\mu$ m. A 50g charge was analysed for Au by fire assay with AA determination. Where the fire assay grade is > 10 g/t gold, a 50g charge was analysed for Au by Fire assay with gravimetric determination.						
		A 10g charge was analysed for 48 elements by 4-acid digest and ICP-MS determination. Elements determined were Ag, As, Ba, Be, Bi, Ca, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Re, S, Sb Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn and Zr. Ag > 100 g/t, Zn, Pb and Cu > 10,000 ppm and S > 10% were re-analysed by the same method using a different calibration.						
		Sample intervals were selected according to geological boundaries. There was no coarse gold observed in any of the core.						
Drilling techniques	<ul> <li>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	Collar details for diamond core drilling (DD) and reverse circulation (RC) historic drilling campaigns is provided below from archival data cross checked with drill logs and available plans and sections where available. Collars shown below are in WGS84, zone 19s which is the standard projection used by CEL for the Project. Collar locations have been check surveyed using differential GPS (DGPS) by CEL to verify if the site coincides with a marked collar or tagged drill site. In most cases the drill collars coincide with historic drill site, some of which (but not all) are tagged. The collar check surveys were reported in POSGAR (2007) projection and converted to WGS84.

A 2-4 ate of I recovered is		
		A possible relationship has been observed between historic sample recovery and Au Ag or 2h grade whereby low recoveries have resulted in underreporting of grade. Insufficient information is not yet available to more accurately quantify this. Core recovery is influenced by the intensity of natural fracturing in the rock. A positive correlation between recovery and RQD has been observed. The fracturing is generally post mineral and not directly associated with the mineralisation.								
Logging	<ul> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation mining studies</li> </ul>	Detailed logs are available for most of the historical drilling. Some logs have not been recovered. No core photographs from the historic drilling have been found. No drill core has survived due to poor storage and neglect. No RC sample chips have been found.								
	<ul> <li>and metallurgical studies.</li> <li>Whether logging is qualitative or quantitative in nature. Core (or costean channel etc) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	For CEL drilling, all the core is logged for recovery RQD weathering lithology alteration mineralization a structure to a level that is suitable for geological modelling resource estimation and metallurgical test work. RC drill chips are logged for geology, alteration and mineralisation. Where possible logging is quantitative. Geological logging is done in MS Excel in a format that can readily be transferred to a database which holds all drilling logging sample and assay data.								
Sub-sampling techniques and sample preparation	<ul> <li>If core whether cut or sawn and whether quarter half or all core taken.</li> <li>If non-core whether riffled tube sampled rotary split etc</li> </ul>	Competent dril split using a wid the drill core w	l core is cut longitudin de blade chisel or a ma here the saw cut is to	hally using a diamor anual core split pre be made to ensure	nd saw for samp ss. 		For GNDD001 – GNDD010 samples analysed by MSA in 2019, three different Certified Standard Reference pulp samples (CRM) with known values for Au Ag Pb Cu and Zn have been submitted with samples of drill core to test the precision and accuracy of the analytic procedures and determination of the MSA laboratory in Canada Two of the standards were only used 4 times each and the third . 26 reference analyses were analysed in the samples submitted in 2019. For CRM 1 one sample returned an Au value > 2 standard deviations (SD) above the certified value. For CRM 2 one sample returned an Au value < 2SD below the certified value. For CRM 3 (graphs below) one sample returned a Cu value > 2SD above the certified value. All other analyses are within 2SD of the expected value. The standards demonstrate suitable precision and accuracy of the analytic process. No systematic bias is observed.

		geology and sampling are currently being compiled and digitised as are sample data geological mapping trench data adit exposures and drill hole results. Geophysical surveys exist but have largely yet to be check located and digitised.
		Drilling on the Hualilan Project (Cerro Sur and Cerro Norte combined) extends to over 150 drill holes. The key historical exploration drilling and sampling results are listed below.
		<ul> <li>1984 – Lixivia SA channel sampling &amp; 16 RC holes (AG1-AG16) totalling 2040m</li> <li>1995 - Plata Mining Limited (TSE: PMT) 33 RC holes (Hua- 1 to 33) + 1500 samples</li> <li>1998 – Chilean consulting firm EPROM (on behalf of Plata Mining) systematic underground mapping and channel sampling</li> <li>1999 – Compania Mineral El Colorado SA ("CMEC") 59 core holes (DDH-20 to 79) plus 1700m RC program</li> <li>2003 – 2005 – La Mancha (TSE Listed) undertook 7447m of DDH core drilling (HD-01 to HD-48)</li> <li>Detailed resource estimation studies were undertaken by EPROM Ltda. (EPROM) in 1996 and CMEC (1999 revised 2000) both of which were written to professional standards and La Mancha 2003 and</li> </ul>
		<ul> <li>2006.</li> <li>The collection of all exploration data by the various operators was of a high standard and had appropriate sampling techniques intervals and custody procedures were used.</li> </ul>
Geology	- Deposit type geological setting and style of mineralisation.	Mineralisation occurs in all rock types where it preferentially replaces limestone, shale and sandstone and occurs in fault zones and in fracture networks within dacitic intrusions.
		The mineralisation has previously been classified as a Zn-Cu distal skarn (or manto-style skarn) with vein-hosted Au-Ag mineralisation. It has been divided into three phases – prograde skarn retrograde skarn and a late quartz–galena event the evolution of the hydrothermal system and mineral paragenesis is the subject of more detailed geometallurgical work.
		Gold occurs in native form and as inclusions with sulphide and pyroxene. The mineralisation also commonly contains pyrite, chalcopyrite sphalerite and galena with rare arsenopyrite, pyrrhotite and magnetite.
		Mineralisation is either parallel to bedding in bedding-parallel faults, in veins or breccia matric within fractured dacitic intrusions, at lithology contacts or in east-west striking steeply dipping siliceous faults that cross the bedding at a high angle. The faults have thicknesses of 1–4 m and contain abundant sulphides. The intersection between the bedding-parallel mineralisation and east-striking cross veins seems to be important in localising the mineralisation.
Drill hole Information	<ul> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all</li> </ul>	The following significant intersections have been reported by previous explorers. A cut-off grade of 1 g/t Au equivalent has been used with up to 2m of internal diltion or a cut-off grade of 0.2 g/t Au equivalent and up to 4m of internal diltion has been allowed. No metallurcial or recovery factors have been used. Drill collar location

Criteria	JORC Code explanation	Commentary
		metal equivalents calculation have a reasonable potential of eventual economic recovery. While Cu and Pb are reported in the table above, these metals are not used in the Au equivalent calculation at this early stage of the Project.
		No top cuts have been applied to the reported grades.
Relationship between mineralisation widths and intercept lengths	<ul> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drill hole angle is known its nature should be reported.</li> <li>If it is not known and only the down hole lengths are reported there should be a clear statement to this effect (eq 'down hole length true width not known').</li> </ul>	The mineralisation is moderately or steeply dipping and strikes NNE and ENE. For some drill holes, there is insufficient information to confidently establish the true width of the mineralized intersections at this stage of the exploration program. Apparent widths may be thicker in the case where bedding-parallel mineralisation may intersect ENE-striking cross faults and veins. Representative cross section interpretations have been provided with release of significant intersections to allow estimation of true widths from individual drill intercepts.
Diagrams	- Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Representative maps and sections are provided in the body of report.
Balanced reporting	<ul> <li>Where comprehensive reporting of all Exploration Results is not practicable representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</li> </ul>	All available data have been reported.
Other substantive exploration data	<ul> <li>Other exploration data if meaningful and material should be reported including (but not limited to): geological observations; geophysical survey results;</li> </ul>	Geological context and observations about the controls on mineralisation where these have been made are provided in the body of the report.
	geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density groundwater geotechnical and rock	229 specific gravity measurements have been taken from the drill core recovered during the drilling program. These data are expected to be used to estimate bulk densities in future resource estimates.
	characteristics; potential deleterious or contaminating substances.	kilometre in length lines are spaced 100m apart with a 50m dipole. The initial results indicate possible extension of the mineralisation with depth. Data will be interpreted including detailed re-processing and drill testing.
		A ground magnetic survey and drone magnetic survey have been completed. The results of these data are being processed and interpreted with the geological information provided from surface and in the drilling and will be used to guide future exploration.

# Section 3 Estimation and Reporting of Mineral Resources

# (Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	<ul> <li>Measures taken to ensure that data has not been corrupted by for example transcription or keying errors between its initial collection and its use for Mineral Resource estimation purposes.</li> <li>Data validation procedures used.</li> </ul>	Geological logging completed by previous explorers was done on paper copies and transcribed into the drill hole database. The data was checked for errors. Checks can be made against the original logs and core photographs.
		Assay data is received in digital format. Backup copies are kept and the data is copied into the drill hole database.
		The drill hole data is backed up and is updated periodically by a Company GIS and data team.
Site visits	- Comment on any site visits undertaken by the Competent Person and	Site visits have been undertaken from 3 to 16 October 2019 15 to 30 November 2019 and 1-19
	the outcome of those visits. - If no site visits have been undertaken indicate why this is the case.	February 2020. The performance of the drilling program collection of data and sampling procedures were initiated during these visits.
Geological interpretation	<ul> <li>Confidence in (or conversely the uncertainty of) the geological interpretation of the mineral deposit.</li> <li>Nature of the data used and of any assumptions made.</li> <li>The effect if any of alternative interpretations on Mineral Resource estimation</li> </ul>	The interpretation is considered appropriate given the stage of the project and the nature of activities that have been conducted. The interpretation captures the essential geometry of the mineralised structure and lithologies with drill data supporting the findings from the initial underground sampling activities.
	<ul> <li>The use of geology in guiding and controlling Mineral Resource estimation.</li> <li>The factors affecting continuity both of grade and geology.</li> </ul>	The most recent resource calculation (2006 and 2003 – La Mancha) used all core drilling at the time and detailed underground channel sampling collected by EPROM CMEC and La Mancha. Overlying assumptions included a reduction of the calculated grade in each resource block by a factor of 10% to account for possible errors in the analyses and samples. An arbitrary reduction factor was applied to the 2006 resource whereby the net reported tonnage was reduced by 25% for indicated resource blocks 50% for inferred resource blocks and 75% of potential mineral resource blocks. The reason for the application of these tonnage reduction factors was not outlined in the resource report. It is noted that at the time of this report La Mancha was in a legal dispute concerning the project with its joint venture partner and given the acquisition of a 200000 Oz per annum producing portfolio the project was likely no longer a core asset for La Mancha at that time. Additionally under the original acquisition agreement La Mancha had to issue additional acquisition shares based on resource targets.
		The effect of removing the assumptions relating to application of the arbitrary tonnage reduction factors applied increases the overall resource tonnage by in excess of 50%. Removing these correction factors would bring the overall tonnage and grade close the earlier (2003 1999 and 1996)

Criteria	JORC Code explanation	Commentary
		tonnage and grade estimates albeit in different categories (lower confidence) which are considered more appropriate.
		The mineralisation is defined to the skarn and vein bodies detailed cross section and plan maps were prepared for these bodies with their shapes used in controlling the resource estimate.
		The structure of the area is complex and a detailed structural interpretation is recommended as this may provide a better understanding of the continuity of mineralisation and possible extensions to it. The deposit contains bonanza gold values and while very limited twinning has indicated acceptable repeatability a rigorous study of grade continuity needs to be undertaken as part of future resource calculations.
Dimensions	<ul> <li>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise) plan width and depth below surface to the upper and lower limits of the Mineral Resource.</li> </ul>	For the historic resource no reliable information has been provided to the owner however through further ongoing investigation is being conducted by the owner to address this information gap.
Estimation and modelling techniques	- The nature and appropriateness of the estimation technique(s) applied and key assumptions including treatment of extreme grade values domaining interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.	The historic resource estimation techniques are considered appropriate. The 2003 and 2006 resources used a longitudinal section polygonal method was used for estimating resources with individual blocs representing weighted averages of sampled underground and/or areas of diamond drill pierce points with zones of influence halfway to adjacent holes. The area of the block was calculated in AutoCad directly from the longitudinal sections.
	<ul> <li>The availability of check estimates previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</li> <li>The assumptions made regarding recovery of by-products.</li> <li>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage</li> </ul>	Check assaying by PG Consulting returned values in the check assay sample which were 3.4% and 13% greater for Au and Ag than the original assays. A number pf previous resource estimates were available to check the 2006 resource estimate when the arbitrary tonnage reduction factors are removed brings the overall tonnage and grade close the earlier (2003 1999 and 1996) tonnage and grade estimates albeit indifferent categories which are considered more appropriate.
	<ul> <li>characterisation).</li> <li>In the case of block model interpolation the block size in relation to the average sample spacing and the search employed.</li> <li>Any assumptions behind modelling of selective mining units.</li> </ul>	It was assumed only gold silver and zinc would be recovered and that no other by products would be recovered. This is viewed as conservative given metallurgical data pointing to the production of a saleable zinc concentrate.
	<ul> <li>Any assumptions about correlation between variables.</li> <li>Description of how the geological interpretation was used to control the resource estimates.</li> </ul>	Based on the preliminary metallurgy estimation of deleterious elements or other non-grade variables of economic significance was not required.
	<ul> <li>Discussion of basis for using or not using grade cutting or capping.</li> <li>The process of validation the checking process used the comparison of model data to drill hole data and use of reconciliation data if available</li> </ul>	The minimum mining width of 0.8m was assumed for veins less than 0.6m and for wider widths a dilution of 0.2m was used to calculate the grade.

Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 **Directors** Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman

Criteria	JORC Code explanation	Commentary
		No assumptions were made regarding correlation between variables.
		The mineralisation is defined within skarn and associated vein deposits. Detailed cross section and plan maps were prepared for these domains with their shapes used in controlling the resource estimate. Long sections of the veins and skarn were taken and sampling was plotted and the blocks outlined considering this.
		Grade cutting was not used in the calculation of the resource and no discussion was given as to why it was not employed. It is recommended that a study be undertaken to determine if an appropriate top cut need be applied No data is available on the process of validation.
Moisture	- Whether the tonnages are estimated on a dry basis or with natural moisture and the method of determination of the moisture content.	No data is available.
Cut-off parameters	- The basis of the adopted cut-off grade(s) or quality parameters applied.	The Mineral Resource Estimate is above a cut-off grade of 3.89 g/t Au. This is based on the assumed mining cost at the time of the estimate.
Mining factors or assumptions	<ul> <li>Assumptions made regarding possible mining methods minimum mining dimensions and internal (or if applicable external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the mining assumptions made.</li> </ul>	<ul> <li>The Mineral Resource Estimate considered the assumptions outlined below which are considered appropriate; <ul> <li>Metal prices: Au U\$\$550 Oz Ag U\$\$10 Oz</li> <li>Metallurgical Recovery; Au – 80% Ag – 70% Zn - nil</li> <li>Operating cost: U\$\$55t based on underground cut and fill mining and flotation and cyanidation combined</li> </ul> </li> <li>The minimum mining width of 0.8m was assumed for veins less than 0.6m and for wider widths a dilution of 0.2m was used to calculate the grade.</li> </ul>
Metallurgical factors or assumptions	- The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the metallurgical assumptions made.	<ul> <li>Historical metallurgical test-work assumptions were 80% recovery for Au, Ag and Zn.</li> <li>The most recent historic test work was conducted in 1999 by Lakefield Research (cyanidation) and CIMM Labs (flotation) in Chile on 4 samples which all contain primary sulphide minerals and so can be considered primary, partial oxide or fracture oxide samples.</li> <li>The test work was conducted using a 150 micron grind which would appear to coarse based on petrography conducted by CEL which shows that the gold particles average 30-40 microns.</li> <li>Rougher flotation tests were performed with a 20 minute and 30 minute floatation time. Generally, the longer residence time improved recovery. Recoveries to concentrate for gold range from 59.6% - 80.6% and for silver from 63.1% - 87.2%.</li> </ul>

		<ul> <li>Knelson concentrate tests with floatation of tailings were also completed. Applying a joint process Knelson concentrator and floatation of the tailings of the concentrator it is found that the global recovery is approximately 80% for gold.</li> <li>While the testwork was focused predominantly on gold recovery some rougher floation testwork was undertaken targeting Zn recovery producing up to 85% recoveries. In sulphide samples this produced a Zn concentrate containing 42% Zn with grades in excess of 50% Zn in concentrate expected with additional floatation stages.</li> <li>The report concluded that it was possible to produce a commercial Au-Ag concentrate and a Zn concentrate.</li> <li>Extraction of gold and silver by cyanidation was tested on 3/8 and % inch (9.525mm and 19.05mm) crush sizes that are designed to test a heap leach processing scenario. Bottle roll of these crush size resulted in 41-39% gold recovery and 31-32% silver recovery with high cyanide consumption. No tests have been done on material at a finer grind size.</li> <li>More recently, CEL has completed initial metallurgical test work on a 147 kg composite sample of drill core from GMDD039, GMDD040, GMDD041, GNDD043, GNDD003 and GNDD018. The sample is of skarn mineralisation in limestone that has a weighted average grade of 10.4 g/t Au, 31.7 g/t Ag, 3.2 % Zn, 0.15 % Cu and 0.46 % Pb. Separate tests on 2 kg sub-samples were done with differing grinding times, Knelson and Mosley table gravity separation techniques and floatation techniques to provide a series of gravity and floatation concentrates. Key results are:</li> <li>Combined gravity separation followed by a sulfide flotation process when re-combined produced a single product with a median grade of 47 g/t Au, 120 g/t Ag and 13% Zn with a recovered weight of 24-33% of the sample weight.</li> <li>Tailings fragment analysis indicates a grind of (pa) 72-106 µm. Generally, a coarser grind resulted in a higher % weight recovered to the concentrate with a corr</li></ul>		
Environmental factors or assumptions	<ul> <li>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and</li> </ul>	It is considered that there are no significant environmental factors which would prevent the eventual extraction of gold from the project. Environmental surveys and assessments will form a part of future pre-feasibility.

	processing operation. While at this stage the determination of potential environmental impacts particularly for a greenfields project may not always be well advanced the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.	
Bulk density	<ul> <li>Whether assumed or determined. If assumed the basis for the assumptions. If determined the method used whether wet or dry the frequency of the measurements the nature size and representativeness of the samples.</li> </ul>	Densities of 2.7 t/m3 were used for mineralised veins and 2.6 t/m3 for wall rock. No data of how densities were determined is available.
	<ul> <li>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs porosity etc) moisture and differences between rock and alteration zones within the</li> </ul>	The bulk densities used in the evaluation process are viewed as appropriate at this stage of the Project.
	<ul> <li>deposit.</li> <li>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</li> </ul>	CEL is collecting specific gravity measurements from drill core, which it is expected will be able to be used to estimate the block and bulk densities in future resource estimates. For RC drilling, the weights of material recovered from the drill hole is able to be used as a measure of the bulk density.
Classification	<ul> <li>The basis for the classification of the Mineral Resources into varying confidence categories.</li> <li>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations reliability of input data confidence in continuity of geology and metal values quality</li> </ul>	The Mineral Resource Estimate has both Indicated and Inferred Mineral Resource classifications under the National Instrument 43-101 code and is considered foreign. These classifications are considered appropriate given the confidence that can be gained from the existing data and results from drilling.
	<ul> <li>quantity and distribution of the data).</li> <li>Whether the result appropriately reflects the Competent Person's view of the deposit.</li> </ul>	The reliability of input data for the 2003 and 2006 resources is acceptable as is the confidence in continuity of geology and metal values quality quantity and distribution of the data. Appropriate account has been taken of all relevant factors with the exception of studies into the appropriateness of the application of a top cut.
		The reported 2006 NI43-101 (non-JORC Code compliant Measured and Indicated) estimate for the Hualilan Project is measured resource of 164294 tonnes averaging 12.6 grams per tonne gold and 52.1 g/t silver and 2.5% zinc plus an indicated resource of 51022 tonnes averaging 12.4 grams per tonne gold and 36.2 g/t silver and 2.6% zinc plus an inferred resource of 213952 tonnes grading 11.7 grams per tonne gold and 46.6 g/t silver and 2.3% zinc. (Source La Mancha resources Toronto Stock Exchange Release April 7 2007 - Interim Financials) – See Table 1.
		The 2006 estimate did not include the east-west mineralised Magnata Vein despite the known mineralisation in the Magnata Vein being drilled on a 25 x 50-metre spacing. The 2003 NI43-101

Criteria	JORC Code explanation	Commentary
		The earlier (1996 and 2000) Mineral Resource Estimates were audited and re-stated in a 2003 resource report. This independent report was done to NI-43-101 standard and the results of this report were released to the TSX. This report concluded that "Detailed resource calculations made by three different groups are seen to be realistic.
Discussion of relative accuracy/ confidence	- Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits or if	There is sufficient confidence in the data quality drilling methods and analytical results that they can be relied upon. The available geology and assay data correlate well. The approach or procedure are deemed appropriate given the confidence limits. The main two factors which could affect relative accuracy is grade continuity and top cut.
	<ul> <li>such an approach is not deemed appropriate a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</li> <li>The statement should specify whether it relates to global or local estimates and if local state the relevant tonnages which should be</li> </ul>	Grade continuity is variable in nature in this style of deposit and has not been demonstrated to date and closer spaced drilling is required to improve the understanding of the grade continuity in both strike and dip directions. It is noted that the results from the twinning of three holes by La Mancha are encouraging in terms of grade repeatability.
	<ul> <li>relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</li> <li>These statements of relative accuracy and confidence of the estimate should be compared with production data where available.</li> </ul>	The deposit contains very high grades and there is a potential need for the use of a top cut. It is noted that an arbitrary grade reduction factor of 10% has already been applied to the resource as reported.
		No production data is available for comparison
