# FRASER RANGE EXPLORATION UPDATE

## Highlights

- **Diamond drilling completed at the Lantern South Prospect with zones of heavily disseminated sulphide intercepted from 110.5m to 111.35m and from 169m to 171.3m**
- **Downhole EM surveying will be undertaken to look for off-hole conductors at the Lantern South and Lantern East Prospects**
- **Updated modelling of EM targets at the Delta Blues Prospect shows two highly conductive targets**
- **DB1 modelled as a single 800 metre long body with conductivity of 11,000 Siemens**
- **DB2 modelled as a 460 metre long body with conductivity of 3,300 Siemens**

**Galileo Mining Ltd** (ASX: GAL, "Galileo" or the "Company") advises that one diamond drill hole has been completed at the Company's Lantern South prospect in Western Australia's Fraser Range region. The drill hole was completed to check for mineralisation beneath RC drill hole LARC012 and to establish a platform for down hole EM surveying.

Two zones of heavily disseminated sulphide were intercepted within drill hole LADD003 from 110.5m to 111.35m and from 169m to 171.3m. Sulphides were predominantly pyrrhotite (iron sulphide) with minor pentlandite (nickel sulphide) and minor chalcopyrite (copper sulphide).

At the Company's Delta Blues prospect, infill EM surveying has resulted in updated models for two targets at DB1 and DB2.

DB1 displays a particularly strong conductivity of 11,000 Siemens and DB2 also has a high modelled conductivity of 3,300 Siemens. While conductive targets can have multiple sources, it is encouraging that weathered sulphides have been recorded in aircore drilling<sup>1</sup> less than 400 metres away from DB1. Meanwhile target DB2 occurs less than 300 metres from sulphides intersected in drilling by S2 Resources<sup>2</sup>.

(1) Refer to Galileo's ASX announcement dated 3rd December 2019

(2) Refer to S2 Resources' ASX announcement dated 14th December 2020

Commenting on the latest Fraser Range results Galileo Managing Director Brad Underwood said; *“We have completed our first diamond drilling program of the year at Lantern East and Lantern South, and continue to build up new targets for drill testing at our highly prospective Fraser Range Project.*

*The drilling results show that we have sulphides occurring in the right geological environment on our tenements. This means that we have the correct components required to form a mineral deposit and we will continue to aggressively explore for economic mineralisation.*

*We have developed good quality nickel targets from our initial work over the previous two years on this greenfields project. Our drilling programs in 2021 are designed to test these targets with the aim of making new discoveries.”*

LADD003 intersected a multi-phased ultramafic unit within a gabbro-norite host rock. Disseminated sulphides (pyrrhotite-chalcopyrite-pentlandite) occur close to the contact zone between the ultramafic and the host rock. Detailed structural and lithological logging of all drill core will provide valuable information to assist the understanding of the occurrence and nature of the mineralisation. This will greatly benefit future drill targeting at the Lantern Prospects and within Galileo tenements over the surrounding area.

Core will be submitted to the laboratory for assaying after the completion of logging however handheld XRF readings did not identify nickel or copper at levels above those recorded from diamond drilling at Lantern South in 2020<sup>3</sup>. Please see Table 1 for drill log summary and Figure 2 for drill hole location.

Downhole EM surveying at the Lantern South and Lantern East prospects will be completed to look for off-hole conductive targets that could represent significant accumulations of massive sulphides.

**Figure 1 — Disseminated Sulphide in LADD003 at 170m (pyrrhotite with minor pentlandite/chalcopyrite)**

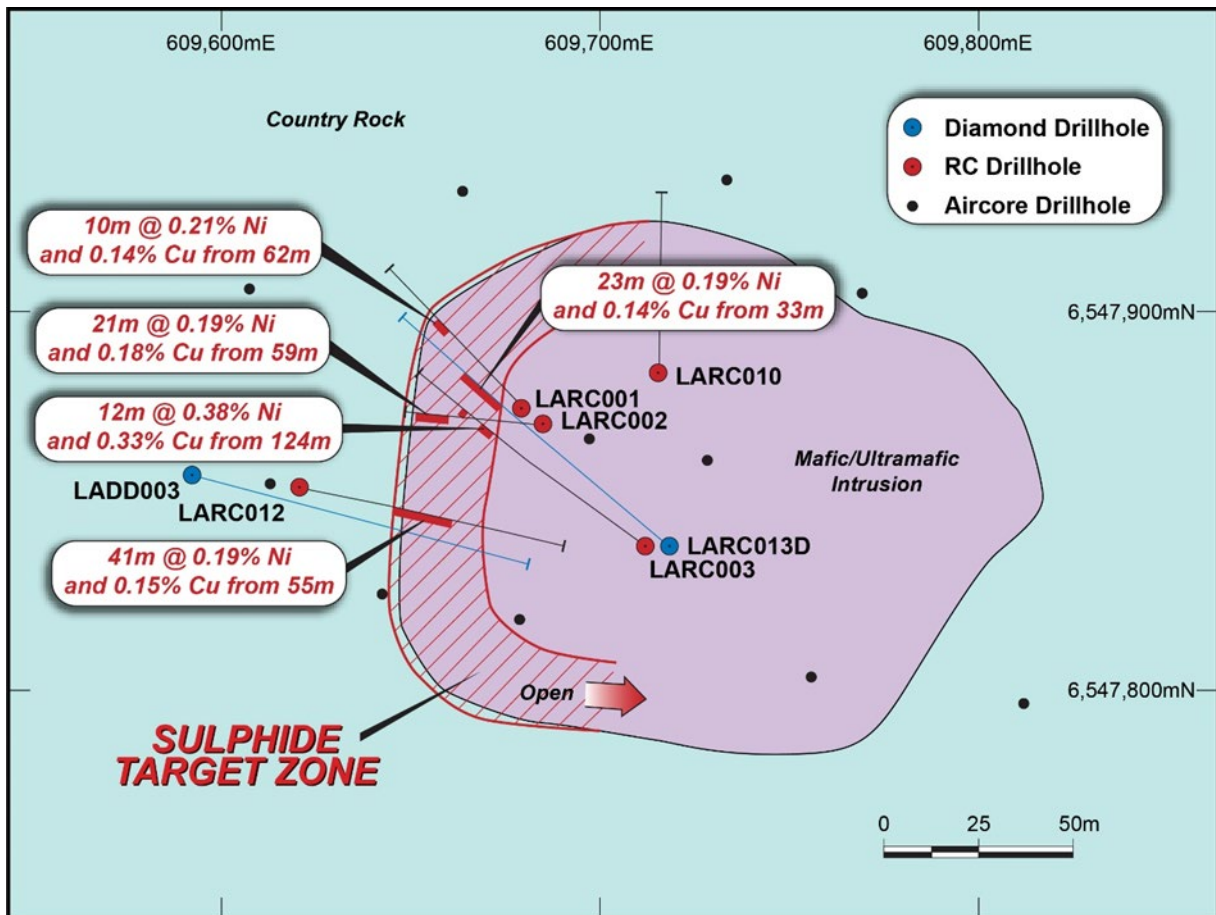

(3) Refer to Galileo’s ASX announcement dated 28<sup>th</sup> October 2020

**Table 1: LADD003 Drill Log Summary**

From (m)	To (m)	Comment
0	51	Transported cover
51	80.4	Saprolite/weathered gabbronorite
80.4	110.5	Gabbronorite and leucogabbro
110.5	111.35	Olivine gabbronorite, heavily disseminated sulphide
111.35	114	Olivine gabbronorite and pyroxenite
114	169	Gabbronorite
169	171.3	Gabbronorite, heavily disseminated sulphide
171.3	213.2	Ultramafic and gabbronorite

**Figure 2 —Lantern South Prospect Plan Showing Sulphide Target Zone and Drill Hole LADD003**

## **Delta Blues Updated EM Modelling**

Infill EM surveying at Galileo’s Delta Blues prospect was undertaken after conductive responses were observed in preliminary surveying of the area<sup>4</sup>.

Updated modelling of EM data at anomaly DB1 shows a single, very strong conductor of 11,000 Siemens. The centre of target DB1 is less than 400 metres northwest of Galileo’s drill hole DBAC002 which intersected nickel prospective host rocks with minor weathered sulphides<sup>1</sup>.

Petrographic description of rock chips from DBAC002 (see Figure 3 for drill hole location) identified a metamorphosed cumulate mafic granulite with minor goethised sulphides. Goethised sulphide grains (0.5 – 1%) form 1mm clusters within the sample. This rock unit appears to have intruded a metamorphosed volcano-sedimentary package in a similar geologic environment to magmatic systems with known nickel sulphide mineralisation in the Fraser Range.

Target DB1 also occurs approximately 4km along strike from Legend Mining’s Crean Prospect where drilling has identified ultramafic intrusive rock units prospective for nickel sulphide mineralisation <sup>5</sup> (Figure 3).

Updated modelling of EM data at anomaly DB2 indicates a conductor of 3,300 Siemens. The centre of this conductive model is 300 metres south of a six-metre band of semi-massive and net-textured sulphide intercepted in diamond core drilling by S2 Resources (see S2 Resources ASX Announcement dated 14<sup>th</sup> December 2020).

The presence of sulphides in DBAC002 and in S2 Resource’s drilling suggests that the cause of the conductive anomalies could be related to additional sulphide mineralisation. However, conductive anomalies can also be formed by non-economic rock units including graphitic or sulphidic sediments. Drilling programs at Delta Blues will be undertaken following receipt of statutory approvals.

Details of the modelled conductors are presented in Table 2.

**Table 2: Delta Blues modelled conductors:**

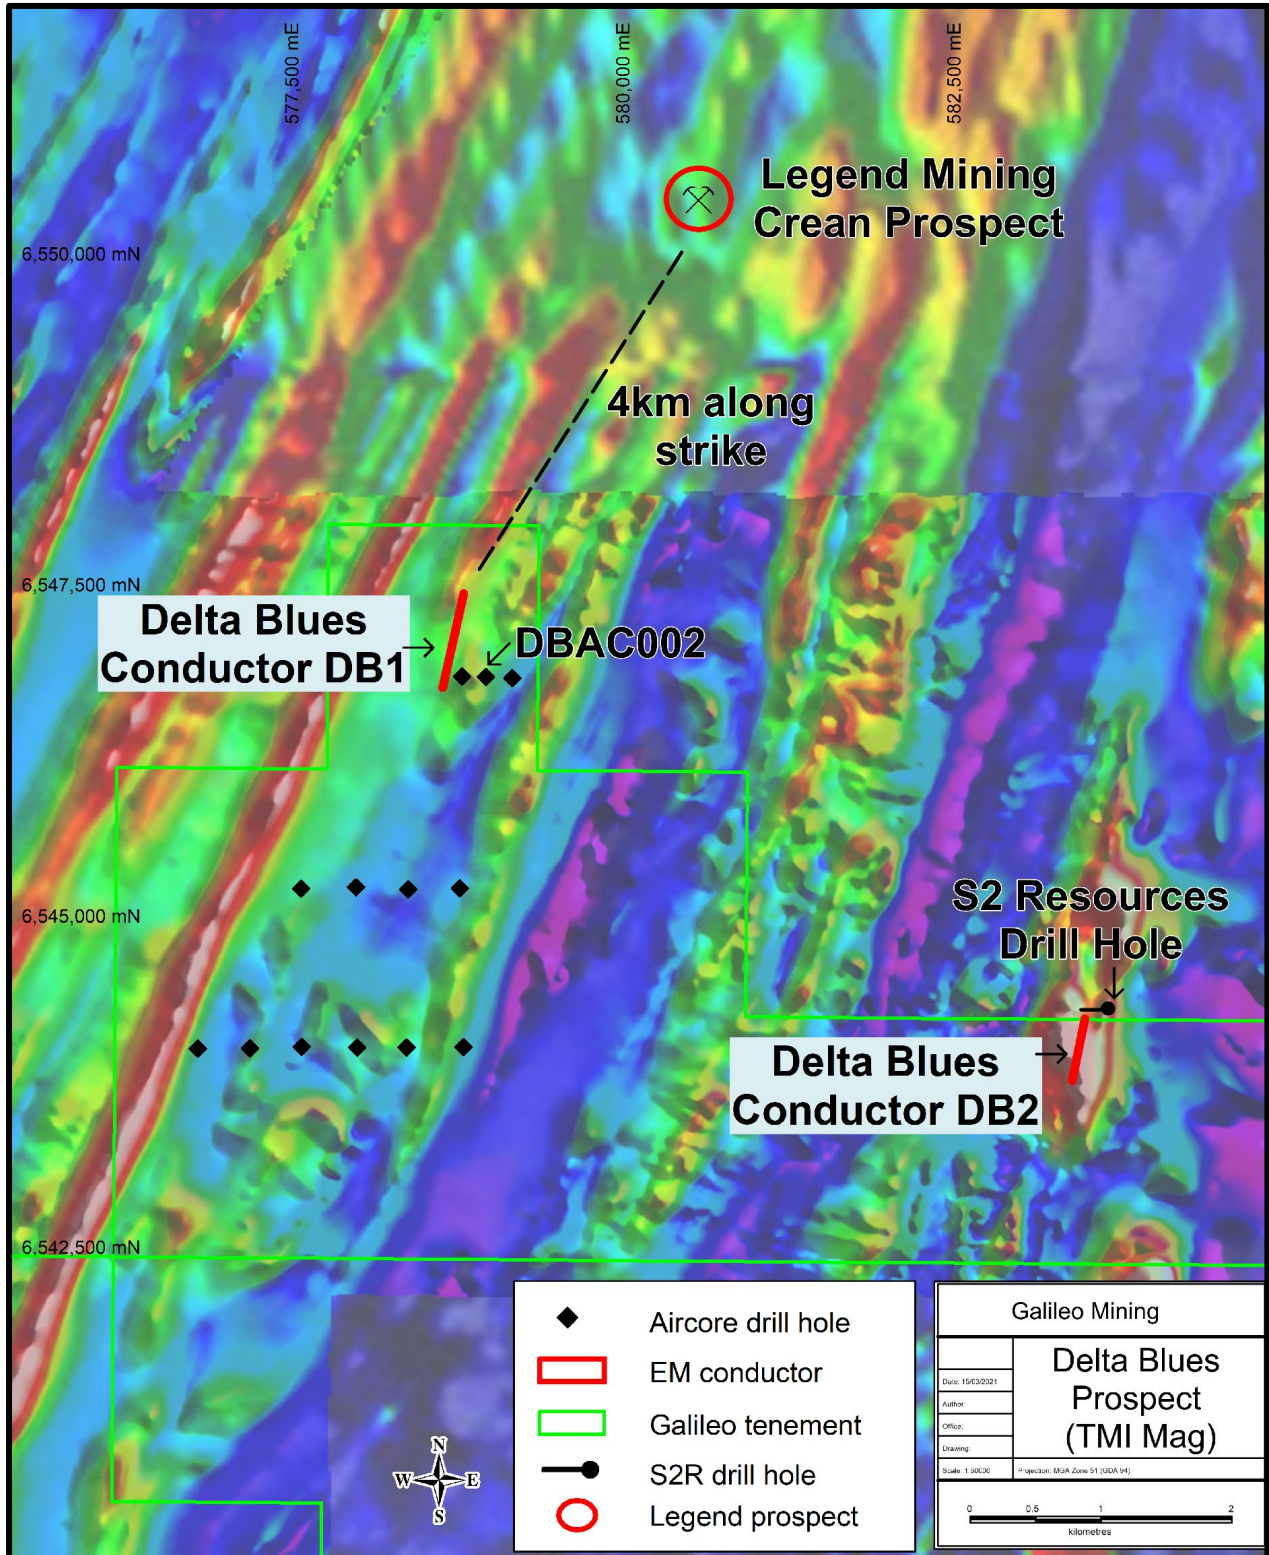

<b>Prospect</b>	<b>Conductance</b>	<b>Length</b>	<b>Height</b>	<b>Depth to Top</b>
DB1	11,000S	800m	40m*	255m
DB2	3,300S	460m	300m*	185m

\* Down-dip extents of sub-vertical conductive bodies are poorly constrained as EM surveying preferentially responds to the upper part of the conductor.

## Competent Person Statement

The information in this report that relates to Exploration Results is based on, and fairly represents, information and supporting documentation prepared by Mr Brad Underwood, a Member of the Australasian Institute of Mining and Metallurgy, and a full time employee of Galileo Mining Ltd. Mr Underwood has sufficient experience that is relevant to the styles of mineralisation and types of deposit under consideration, and to the activity being undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves” (JORC Code). Mr Underwood consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

With regard to the Company’s ASX Announcements referenced in the above Announcement, the Company is not aware of any new information or data that materially affects the information included in the Announcements.

**Authorised for release by the Galileo Board of Directors.**

### About Galileo Mining:

Galileo Mining Ltd (ASX: GAL) is focussed on the exploration and development of nickel, copper and cobalt resources in Western Australia. GAL has Joint Ventures with the Creasy Group over tenements in the Fraser Range which are highly prospective for nickel-copper sulphide deposits similar to the operating Nova mine. GAL also holds tenements near Norseman with over 26,000 tonnes of contained cobalt, and 122,000 tonnes of contained nickel, in JORC compliant resources (see Figure 5 below).

*Figure 5: JORC Mineral Resource Estimates for the Norseman Cobalt Project (“Estimates”) (refer to ASX “Prospectus” announcement dated May 25<sup>th</sup> 2018 and ASX announcement dated 11<sup>th</sup> December 2018, accessible at <http://www.galileomining.com.au/investors/asx-announcements/>). Galileo confirms that all material assumptions and technical parameters underpinning the Estimates continue to apply and have not materially changed).*
