

## MLEM SURVEY IDENTIFIES HIGH PRIORITY DRILL TARGET AT NEPEAN

---

### Highlights

- Major moving-loop electromagnetic (MLEM) survey has **successfully identified and delineated a discrete strongly-conductive body 1.8km south of the historic Nepean nickel mine**
  - The **5,000 – 15,000S strength of the conductor is typical of well-developed massive to semi-massive sulphide mineralisation**
  - The modelled conductor is **relatively shallow at only ~ 60m below surface with a strike width of 120m**, with the dip and plunge of the conductive body consistent with the orientation of the regional stratigraphy
  - This **high-priority drill target will be tested immediately** with three drill-holes ranging between 150-250m depth
  - Preparations continue on schedule for the maiden Nepean Deeps drilling programme to commence later this month
- 

Auroch Minerals Limited (ASX:AOU) (Auroch or the Company) is pleased to announce that **a recently-completed major ground MLEM survey has successfully identified and delineated a strongly-conductive body at its Nepean Nickel Project** in Western Australia (Auroch 80%, Lodestar Resources Ltd 20%).

The discrete conductor sits approximately 1.8km south of the historic high-grade Nepean nickel sulphide mine, and is coincident with a magnetic high feature interpreted as a serpentinised komatiitic ultramafic, which is the same lithology that hosts the nickel sulphide mineralisation at the historic Nepean mine (see Figure 1).

The modelled EM plate has a strong conductance ranging between 5,000 – 15,000S, a range typical of the conductance of well-developed massive to semi-massive sulphide mineralisation. The modelled conductor is relatively shallow at 60-100m vertical depth, and it has a strike length of 120m, which is consistent with Kambalda-style komatiitic channel mineralisation. Importantly, there are no historic drill-holes in the vicinity of the conductor.

**The size, strength, and location of this untested conductor make this a very high priority drill target that the Company intends to drill test immediately. Three reverse circulation (RC) drill-holes ranging between 150-250m deep have been planned to initially test the strong conductor and drilling will commence later this week.** All drill-holes will be cased with PVC to allow for follow up down-hole electromagnetic (DHEM) surveying, which has the potential to provide more accurate targeting of the conductor and to-date has proven a crucial component of Auroch's systematic exploration strategy for nickel sulphide mineralisation.

A second conductor was identified 600m east of the main ultramafic strike. This broad conductor is weaker in strength at 1,500-2,000S with a much longer modelled strike length of 1,000m. There is no magnetic feature present in this area which would support an ultramafic host unit and as such the conductor is not considered a high priority target. The Company will conduct further work to better understand the geology in this area.

**Auroch Managing Director Aidan Platel commented:**

*"The purpose of the extensive high-powered ground MLEM survey was to quickly cover a larger portion of the 10km of Nepean strike in order to prioritise smaller areas for follow-up exploration and subsequent drilling. The MLEM survey was successful in doing exactly that, identifying several conductive bodies that warrant follow-up exploration.*

*In particular, one of these identified conductors is of immense interest, as its high conductivity and discrete size are typical of an EM response caused by well-developed nickel sulphide mineralisation. **The location of this strong conductor coincident with an aeromagnetic anomaly and along strike from the historic high-grade Nepean nickel sulphide mine, in an area that has never been drilled before, significantly add to the high potential of this exciting drill target.***

*The RC drill rig is already on-site at Nepean, drilling the second phase of regional aeromagnetic targets, so we are in an ideal position to redirect the rig to test this new high-priority target immediately. We knew that much of the Nepean strike was under explored and this result, discovered approximately 1.8km south of the historic mine, is a great indication of the potential of this project."*

**Technical Discussion**

The high-powered ground MLEM survey commenced in late April, with the aim to cover a large portion of the Nepean strike length and detect any untested conductive units. HPEM Geophysical Services were contracted to complete the survey which was conducted on 100m station spacing and 200m line spacing. The survey was completed in late June after sporadic wet weather and equipment breakdowns delayed progress. The survey was also extended and infilled in places of interest in order to better define areas of interest.

Massive sulphide bodies rich in iron, nickel and copper will typically have a strong conductive response. For this reason, electromagnetics has been a widely used tool in metals exploration, particular for nickel-copper sulphides, with modern day EM receivers able to detect sulphide bodies at significant depths below surface. Both down-hole EM and surface moving-loop EM have been a critical component of Auroch's exploration strategy to-date, providing exploration success at both the Saints and Leinster nickel projects. At Nepean, the MLEM survey was used as a first-pass method over a large strike length of the ultramafic package in order to produce more refined targets for follow-up exploration and drilling.

The results of the completed MLEM survey are now being modelled in conjunction with the Company's recent drilling data, particularly the regional air-core (AC) drilling programme which was completed in February. Auroch is also currently investigating the conductive ranges of the *Triangular Ore Zone* intercepted in met hole NPDD007 with the aim of refining further drill targets from both the regional RC DHEM and MLEM datasets.

**Exploration Update**

RC drilling recommenced at Nepean in mid-June. The purpose of this second RC drilling campaign is to continue to test aeromagnetic anomalies along the Nepean ultramafic strike that have not yet been drilled. The target areas deemed to have the highest potential for economic nickel sulphide mineralisation have been labelled the Cormorant, Little Eagle, Wagtail, Spoonbill and Triangular Ultramafic prospects (see Figure 1). The programme comprises eighteen RC drill-holes for approximately 2500m, and incorporates the three high-priority drill-holes that will test the strong MLEM conductor. This drilling will lead into the Nepean Deeps drill programme, which is scheduled to begin later this month.

Auroch is currently awaiting results for the recent RC programme at the Leinster Nickel Project which targeted the Woodwind, Firefly and Brass prospects. The assay and DHEM results will provide critical information to plan the next phase of exploration at Leinster.

Figure 1 – Plan map of aeromagnetics over the Nepean Nickel Project showing the area covered by the high-powered ground MLEM survey and the strong MLEM conductor to the south of the historic Nepean nickel mine

This announcement has been authorised by the Board of Directors of the Company.

### Competent Persons Statement

The information in this report that relates to Exploration Results is based on information compiled by Mr Aidan Platel and represents an accurate representation of the available data. Mr Platel (Member of the Australian Institute of Mining and Metallurgy) is the Company's Chief Geological Officer and has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' ("JORC Code 2012"). Mr Platel consents to the disclosure of this information in this report in the form and context in which it appears.

The information in this release that relates to Geophysical Results and Interpretations is based on information compiled by Russell Mortimer, Consultant Geophysicist at Southern Geoscience Consultants. Russell Mortimer is a Member of the Australasian Institute of Geoscientists (AIG) and has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Russell Mortimer consents to the inclusion in the release of the matters based on this information in the form and context in which it appears.

### Forward-Looking Statements

This document may include forward-looking statements. Forward-looking statements include, but are not limited to, statements concerning Auroch Minerals Limited's planned exploration programme and other statements that are not historical facts. When used in this document, the words such as "could," "plan," "estimate," "expect," "intend," "may", "potential", "should," and similar expressions are forward-looking statements. Although Auroch Minerals Limited believes that its expectations reflected in these forward-looking statements are reasonable, such statements involve risks and uncertainties and no assurance can be given that actual results will be consistent with these forward-looking statements.
