ASX Announcement

2 August 2021

Julimar continues to grow with new high-grade zone defined and significant extensions in step-out drilling

Ongoing resource drilling defines new G12 zone along the north-west contact of Gonneville and extends G8 and G9 zones by >500m along strike

Highlights

Drilling results

- Further **exceptional high-grade results** received from the ongoing ~160,000m step-out and resource definition drill program at the **~1.8km x 0.9km** Gonneville Intrusion.
- Drilling has defined a **twelfth high-grade zone (G12),** extended the G8-G9 high-grade zones significantly to the north-east and extended the G2 zone down-plunge:
  - G12: >650m of strike length and interpreted to potentially have up to 450m of dip extent, open along strike and down-dip;
  - G8: >1,000m of strike length and up to 250m of dip extent, open to the north along strike and down-dip;
  - G9: >1,000m of strike length and up to 200m of dip extent, open along strike and down-dip;
- Significant new high-grade (>1g/t Pd) step-out results include:
  - **9m @ 3.6g/t Pd**, 0.6g/t Pt, **1.7% Ni, 0.7% Cu, 0.1% Co** from 237m (JRC263) – New zone (TBD)
  - **14m @ 2.7g/t Pd**, 0.9g/t Pt, 0.1g/t Au, 0.3% Ni, 0.2% Cu, 0.02% Co from 135m (JRC274) – G3
  - **16m @ 1.3g/t Pd**, 0.3g/t Pt, 0.1g/t Au, 0.2% Ni, 0.2% Cu, 0.02% Co from 197m (JRC288) – G8
  - **10m @ 1.6g/t Pd**, 0.3g/t Pt, 0.1g/t Au, 0.4% Ni, **0.5% Cu**, 0.03% Co from 446m (JD076) – G2
  - **11m @ 1.6g/t Pd**, 0.3g/t Pt, **0.5g/t Au**, 0.1% Ni, **0.7% Cu**, 0.01% Co from 495m (JD081) – G6
  - **5.9m @ 2.0g/t Pd**, 0.4g/t Pt, 0.1g/t Au, **0.5% Ni, 0.7% Cu, 0.05% Co** from 131.7m (JD083) – G3
  - **10m @ 1.7g/t Pd**, 0.6g/t Pt, 0.1g/t Au, 0.2% Ni, 0.1% Cu, 0.02% Co from 93m (JRC299) – G12
  - **5m @ 3.7g/t Pd**, 0.3g/t Pt, 0.1g/t Au, 0.3% Ni, 0.2% Cu, 0.03% Co from 297m (JD081) – G2
- Infill drilling across multiple high-grade zones continues to support the geological model and continuity of mineralisation, with significant new high-grade (>1g/t Pd) results including:
  - **15.4m @ 7.1g/t Pd, 1.3g/t Pt, 0.6% Ni**, 0.3% Cu, **0.05% Co** from 48m (JD087) – G2
  - **30m @ 1.7g/t Pd**, 0.4g/t Pt, 0.2g/t Au, 0.2% Ni, 0.3% Cu, 0.02% Co from 132m (JD063) – G6
  - **7m @ 8.1g/t Pd, 3.7g/t Pt**, 0.5g/t Au, **0.5% Ni, 0.5% Cu**, 0.03% Co from 226m (JRC240) – G11
  - **12m @ 5.0g/t Pd**, **1.0g/t Pt**, 0.2g/t Au, 0.2% Ni, **0.5% Cu**, 0.02% Co from 210m (JD085) – G11
  - **15m @ 2.2g/t Pd**, 0.7g/t Pt, 0.4% Ni, **0.5% Cu**, 0.03% Co from 113m (JD064) – G1
  - **13m @ 2.0g/t Pd**, 0.4g/t Pt, **0.6g/t Au**, 0.1% Ni, **0.7% Cu**, 0.01% Co from 247m (JD069) – G4
  - **12.4m @ 2.1g/t Pd**, 0.6g/t Pt, 0.2g/t Au, 0.2% Ni **,0.6% Cu**, 0.02% Co from 155.6m (JD066) – G6
  - **5.6m @ 2.6g/t Pd**, 0.8g/t Pt, **1.3g/t Au**, 0.1% Ni, **0.5% Cu**, 0.01% Co from 33m (JD088) – G6
  - **14m @ 9.7g/t Pd, 3.1g/t Pt**, 0.1g/t Au from 0m (JD066) – Oxide

- **15.9m @ 7.9g/t Pd, 1.8g/t Pt**, 0.1g/t Au from 0m (JD069) – Oxide
- **12.7m @ 10.2g/t Pd, 1.9g/t Pt**, 0.1g/t Au from 3.2m (JD072) – Oxide
- **18m @ 4.1g/t Pd**, 0.8g/t Pt, **1.1g/t Au** from 8m (JRC260) – Oxide

- Assay results pending for a further 116 completed drill holes.
- Maiden Mineral Resource Estimate on track for completion in Q4 2021.

Overview

Chalice Mining Limited ("Chalice" or "the Company", ASX: CHN | OTCQB: CGMLF) is pleased to report significant new results from ongoing exploration and evaluation activities at its 100%-owned **Julimar Nickel-Copper-Platinum Group Element (PGE) Project**, located ~70km north-east of Perth in Western Australia.

The step-out and resource definition drill program at the ~1.8km x 0.9km Gonneville Intrusion is continuing, with over 136,000m of drilling completed to date and a significant number of assay results pending. The COVID-19 pandemic and associated travel restrictions have resulted in minor delays in drilling progress. Additional diamond drill rigs are currently being sourced and are expected on site in the coming weeks.

Results have now been received for drilling targeting:

- The northern and down-dip extensions to the high-grade G1-G9 zones;
- Infill of the high-grade G1-G9 zones on a nominal 40m x 40m spaced grid and of the northern extensions of the G11 zone on a nominal 40m x 80m spaced grid;
- The non-magnetic pyroxenite-rich north-western part of the Gonneville Intrusion (initial wide-spaced lines on a nominal ~80m x 160m spaced grid);

A total of 131 diamond drill holes and 372 RC drill holes (including RC pre-collars with diamond tails) have been completed to date at the project (~136,000m), of which assay results have now been reported for 88 diamond and 300 RC holes (including RC pre-collars with diamond tails). Assay results are pending for a further 116 completed drill holes, with lab turnaround times currently averaging approximately seven weeks.

The current geological interpretation indicates the G8 and G9 zones have been extended significantly along strike to the north-east, while a new high-grade zone (G12) has been defined at the north-western hanging wall contact of Gonneville.

Infill drilling has confirmed that the G5 zone merges with the G2 zone at the northern end, and step-out drilling has closed off the G7 and G10 zones. Importantly, infill drilling continues to support the geological interpretation and in selected cases defines new mineralised zones not seen in wide-spaced drilling.

Within the 81 new drill holes reported in this announcement, there were:

- 283 mineralised intervals (>4m width and >0.3g/t Pd cut-off grade);
- 205 high-grade Pd +/- Pt-Au-Ni-Cu-Co metal intervals (>2m width and >1g/t Pd cut-off grade), including:
  - 63 high-grade Pd-Ni-Cu +/- Pt-Au-Co intervals (>2m width, >1g/t Pd and >0.5% Ni+Cu cut-off grade).

Chalice Managing Director, Alex Dorsch, said: *"The fact that we are still discovering new high-grade zones and identifying significant extensions in step-out drilling so far into the resource drill-out is testament to the exceptional scale and quality of the Gonneville deposit.*

"We have now identified a 12th high-grade zone in drilling targeting the non-magnetic, pyroxenite-rich north-western contact of the intrusion. This is an exciting development, with the newly defined

zone projecting some ~380m down-dip to a previous intersection in deep diamond hole JD018. The new zone remains wide open and requires further drilling to refine.

"In addition, step-out drilling has delivered some exceptional new high-grade results, extending the existing G8 and G9 zones by over 500m along strike. Infill drilling elsewhere within the deposit continues to support our geological model and demonstrate the continuity of the mineralisation.

"Our resource drill-out is continuing at pace, with assays currently pending for 116 holes. We remain on track to deliver our maiden Mineral Resource Estimate next quarter, providing a strong foundation for preliminary economic studies, which are also advancing in parallel.

"We continue to receive positive feedback from the relevant State Government departments regarding access to the Julimar State Forest for initial drill testing to the north of Gonneville. Initial wide-spaced drilling anticipated to commence at Hartog in late Q3 2021, subject to access approval."

Table 1. Interpreted maximum dimensions and status of high-grade zones at Gonneville.

Zone	Previous strike extent	Previous dip-extent	Current strike extent	Current dip-extent	Status
G1	450m	390m	450m	280m	Merges with G2 at depth
G2	690m	490m	800m	500m	Open down-plunge to the north
G3	465m	280m	465m	280m	Open to the north
G4	1250m	600m	1250m	650m	Open to the north and down-dip
G5	650m	270m	650m	200m	Merges with G2 at the northern end
G6	875m	450m	875m	400m	Open down plunge to the north
G7	500m	350m	275m	350m	Closed off
G8	350m	250m	1,000m	250m	Open to the north and down-dip
G9	500m	250m	1,000m	200m	Open along strike and down-dip
G10	400m	300m	350m	300m	Closed off
G11	1,200m	300m	900m	250m	Open to the north and down-dip
G12	N/A	N/A	650m	450m	Open along strike and down-dip

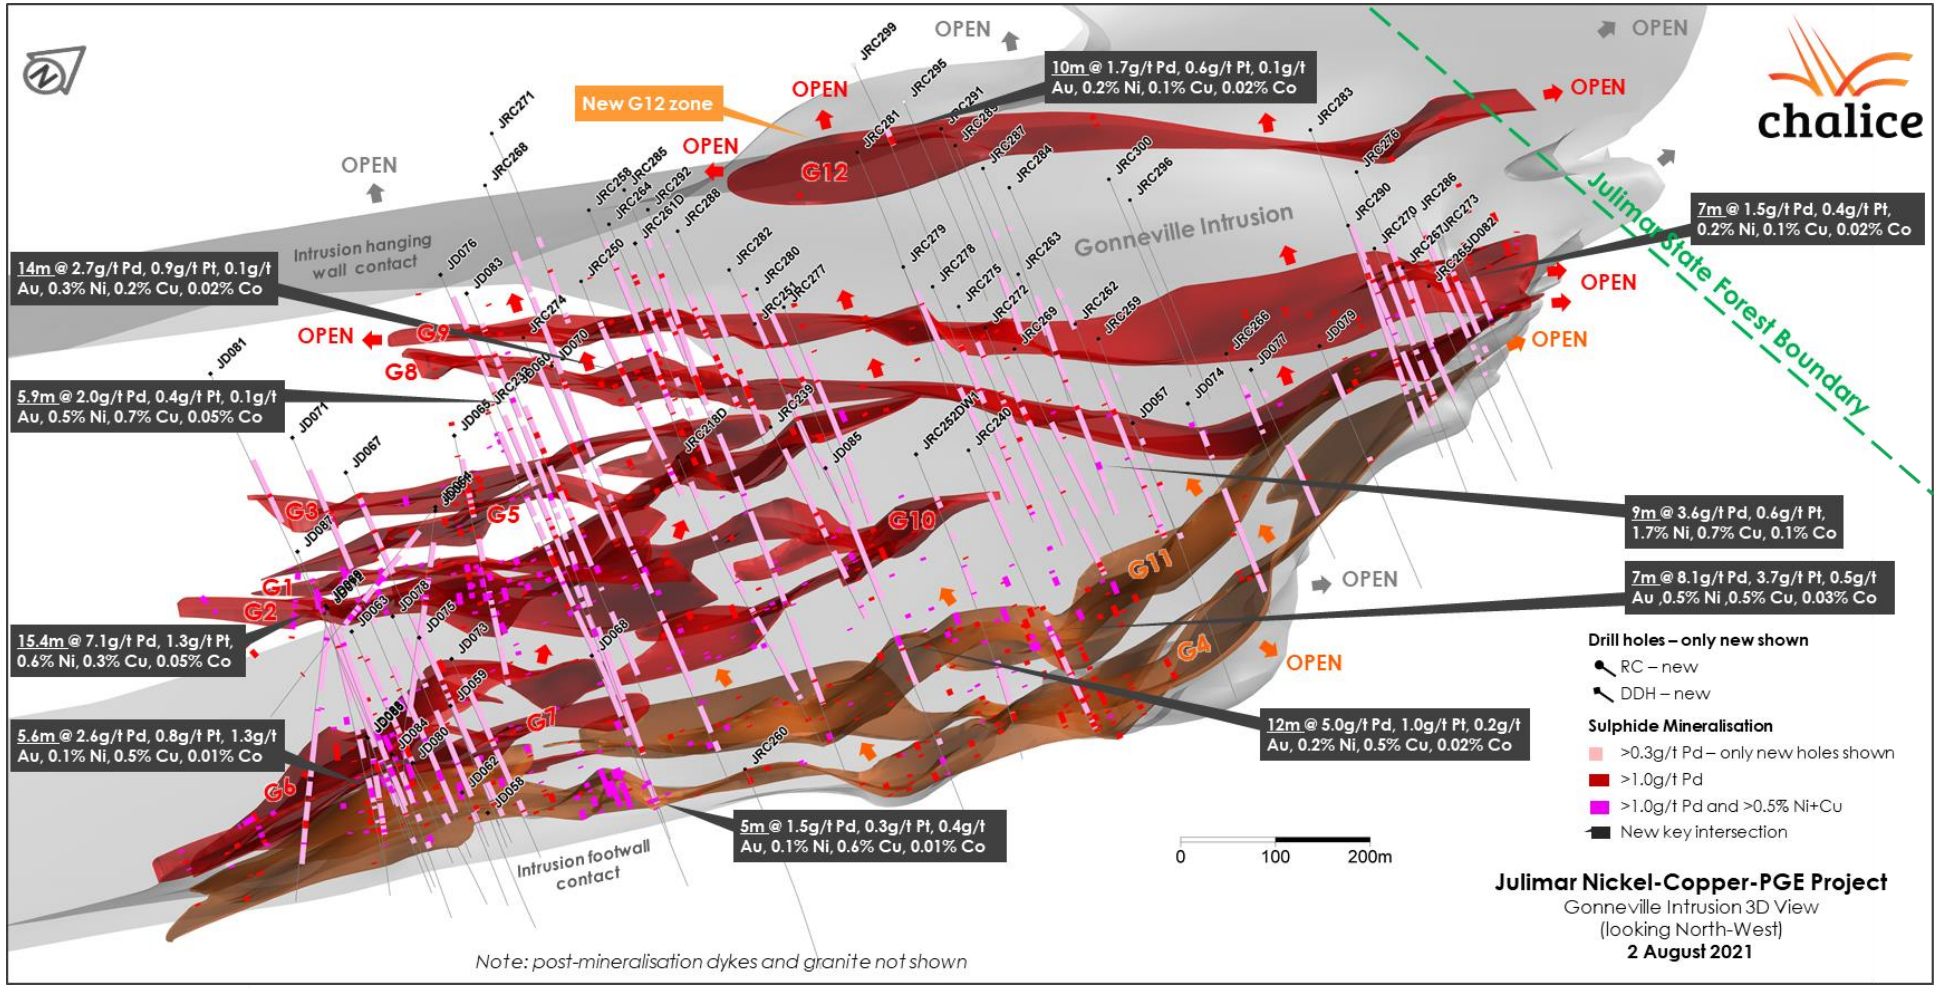

Figure 2. Gonneville Intrusion 3D View (looking North-West) – key new drill results and high-grade zones.

Technical discussion

New high-grade G12 zone

Wide-spaced drilling targeting the north-western end of the Gonneville Intrusion has intersected a zone of mineralisation in serpentinite between a gabbro and pyroxenite contact:

« **10m @ 1.7g/t Pd**, 0.6g/t Pt, 0.1g/t Au, 0.2% Ni, 0.1% Cu, 0.02% Co from 93m (JRC299),

Visual indications from nearby holes indicate that this zone has also been intersected in adjacent holes and, as such, has been interpreted as the 12th high-grade zone within Gonneville (G12).

The Pt:Pd ratio in this intersection is higher than the average for the majority of the Gonneville intrusion mineralisation. Isolated intercepts from previous broad-spaced drilling also contain similarly high Pt:Pd ratios. Infill drilling is required to determine whether these isolated intersections are all part of the same mineralised zone. The latest drilling has also confirmed the geology in this area is more complex than initially thought.

The G12 zone remains open down-dip and has not been tested along strike to the south. Reinterpretation of the results from previous deep hole JD018 (5m @ 1.7g/t Pd, 0.6g/t Pt, 0.2g/t Au, 0.2% Ni, 0.2% Cu, 0.02% Co from 455m, refer to ASX announcement on 18 Nov 2020) has concluded that this intersection is likely the extension of G12, approximately ~380m down-dip from the intersection in JRC299 (Figure 3).

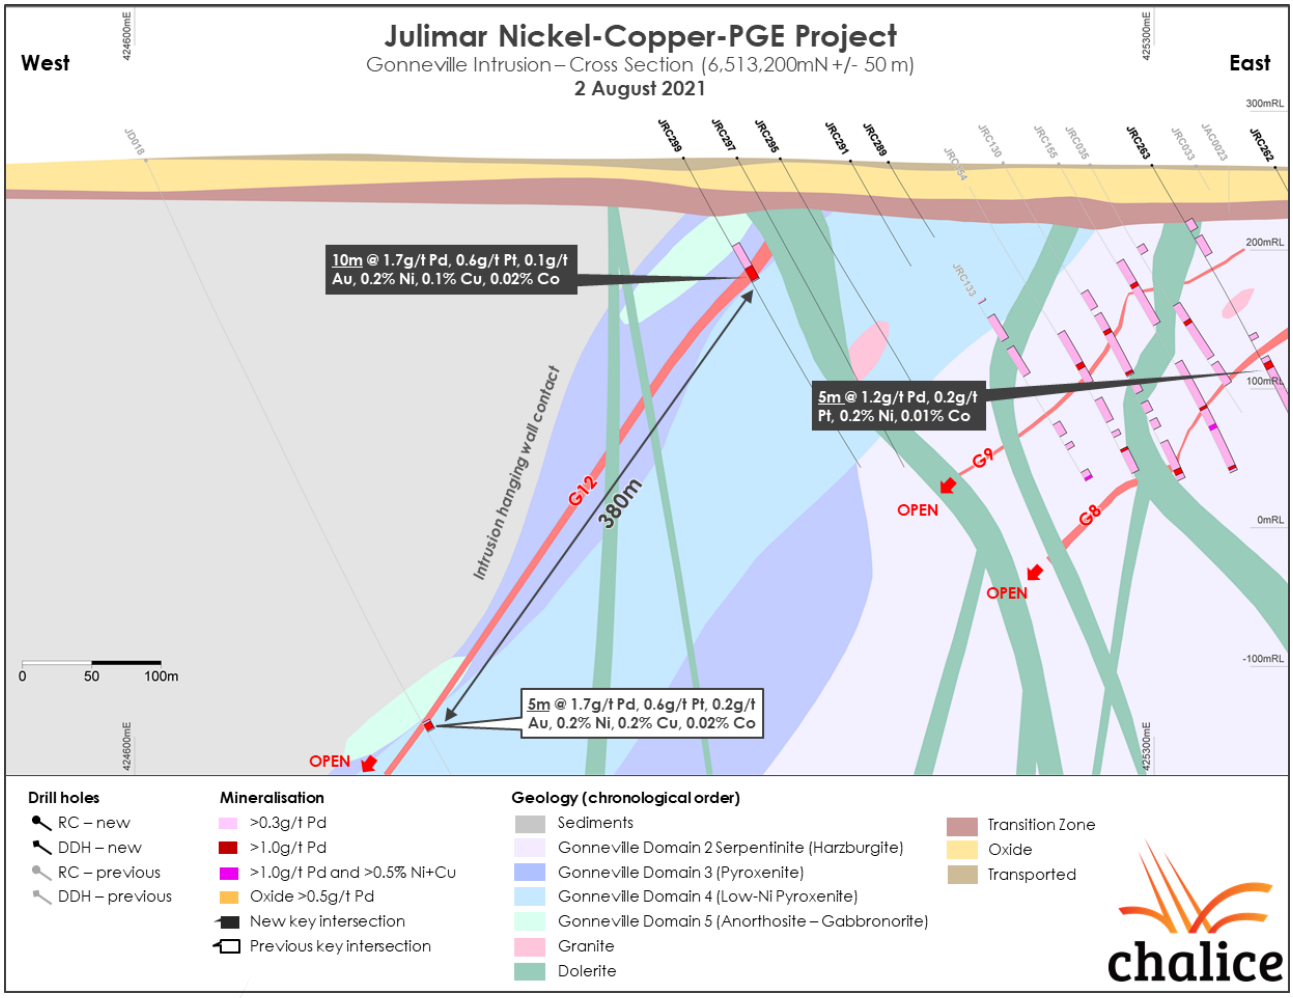

Figure 3. Gonneville G12 zone Cross Section 6,513,200mN +/- 50m.

Step-out drilling results

Previous broad-spaced drilling on a nominal ~160m x 80m spaced grid to the north of the G3 and G5-G9 zones intersected broad zones of disseminated sulphides surrounding narrower high-grade zones (>1g/t Pd).

Results from recent infill drilling on nominal 80-160m x 40m spaced grid indicate that this high-grade mineralisation intersected represents strike extensions of the high-grade G8 and G9 zones (Figure 1Figure 1), which have now both been extended to an interpreted strike length of over ~1,000m (Table 1).

Significant new high-grade (>1g/t Pd) results include:

- **9m @ 3.6g/t Pd**, 0.6g/t Pt, **1.7% Ni, 0.7% Cu**, 0.1% Co from 237m (JRC263) – **new zone located below the G8 zone, remains wide open and further drilling is required to confirm interpretation**;
- **14m @ 1.5g/t Pd**, 0.3g/t Pt, 0.1g/t Au, 0.2% Ni, 0.1% Cu, 0.02% Co from 166m (JRC261D) – G8;
- **16m @ 1.3g/t Pd**, 0.3g/t Pt, 0.1g/t Au, 0.2% Ni, 0.2% Cu, 0.02% Co from 197m (JRC288) – G8; and,
- **6m @ 1.5g/t Pd**, 0.3g/t Pt, 0.2% Ni, 0.1% Cu, 0.02% Co from 87m (JRC261D) – G9.

Mineralisation strikes north-north-east and dips west-north-west, parallel to the contacts of geological domains within the Gonneville Intrusion. Further infill drilling is required to determine the significance of the northern strike extent of these high-grade zones.

Several RC and diamond holes were drilled targeting extensions of the G1-G9 zones down-dip to the west. Significant new high-grade (>1g/t Pd) results include:

- **14m @ 2.7g/t Pd**, 0.9g/t Pt, 0.1g/t Au, 0.3% Ni, 0.2% Cu, 0.02% Co from 135m (JRC274) – G3;
- **11m @ 1.6g/t Pd**, 0.3g/t Pt, 0.5g/t Au, 0.1% Ni, **0.7% Cu**, 0.01% Co from 495m (JD081) – G6;
- **10m @ 1.6g/t Pd**, 0.3g/t Pt, 0.1g/t Au, 0.4% Ni, **0.5% Cu**, 0.03% Co from 446m (JD076) – G2;
- **5.9m @ 2.0g/t Pd**, 0.4g/t Pt, 0.1g/t Au, **0.5% Ni, 0.7% Cu, 0.05% Co** from 131.7m (JD083) – G3; and,
- **5m @ 3.7g/t Pd**, 0.3g/t Pt, 0.1g/t Au, 0.3% Ni, 0.2% Cu, 0.03% Co from 297m (JD081) – G2.

Assays remain pending for several step-out drill holes targeting the down-dip extension of the high-grade G1-G9 zones.

Infill drilling results

Infill drilling continues to confirm continuous zones of high-grade mineralisation across Gonneville. Significant new high-grade (>1g/t Pd) results include:

- **15.4m @ 7.1g/t Pd, 1.3g/t Pt, 0.6% Ni**, 0.3% Cu, **0.05% Co** from 48m (JD087) – G2;
- **30m @ 1.7g/t Pd**, 0.4g/t Pt, 0.2g/t Au, 0.2% Ni, 0.3% Cu, 0.02% Co from 132m (JD063) – G6;
- **7m @ 8.1g/t Pd, 3.7g/t Pt**, 0.5g/t Au, **0.5% Ni, 0.5% Cu**, 0.03% Co from 226m (JRC240) – G11;
- **12m @ 5.0g/t Pd, 1.0g/t Pt**, 0.2g/t Au, 0.2% Ni, **0.5% Cu**, 0.02% Co from 210m (JD085) – G11;
- **15m @ 2.2g/t Pd**, 0.7g/t Pt, 0.4% Ni, **0.5% Cu**, 0.03% Co from 113m (JD064) – G1;
- **13m @ 2.0g/t Pd**, 0.4g/t Pt, 0.6g/t Au, 0.1% Ni, **0.7% Cu**, 0.01% Co from 247m (JD069) – G4;
- **12.4m @ 2.1g/t Pd**, 0.6g/t Pt, 0.2g/t Au, 0.2% Ni, **0.6% Cu**, 0.02% Co from 155.6m (JD066) – G6;
- **5.6m @ 2.6g/t Pd**, 0.8g/t Pt, **1.3g/t Au**, 0.1% Ni, **0.5% Cu**, 0.01% Co from 33m (JD088) – G6;
- **14m @ 9.7g/t Pd, 3.1g/t Pt**, 0.1g/t Au from 0m (JD066) – Oxide;
- **15.9m @ 7.9g/t Pd, 1.8g/t Pt**, 0.1g/t Au from 0m (JD069) – Oxide;
- **12.7m @ 10.2g/t Pd, 1.9g/t Pt**, 0.1g/t Au from 3.2m (JD072) – Oxide; and,
- **18m @ 4.1g/t Pd, 0.8g/t Pt, 1.1g/t Au** from 8m (JRC260) – Oxide.

Broad zones of disseminated sulphide intervals continue to be intersected surrounding the high-grade zones, with significant new intersections (>0.3g/t Pd) including:

- **103m @ 1.1g/t Pd**, 0.4g/t Pt, 0.1g/t Au, 0.2% Ni, 0.2% Cu, 0.02% Co from 218m (JRC240);
- **149m @ 0.8g/t Pd,** 0.2g/t Pt, 0.2% Ni, 0.1% Cu, 0.02% Co from 24m (JRC274);
- **102m @ 0.8g/t Pd**, 0.1g/t Pt, 0.3% Ni, 0.1% Cu, 0.02% Co from 162m (JRC263);
- **158m @ 0.7g/t Pd,** 0.2g/t Pt, 0.1% Ni, 0.1% Cu, 0.01% Co from 102m (JRC285);
- **113m @ 0.7g/t Pd,** 0.2g/t Pt, 0.2% Ni, 0.1% Cu, 0.02% Co from 109m (JRC292);
- **101m @ 0.7g/t Pd**, 0.1g/t Pt, 0.2% Ni, 0.1% Cu, 0.02% Co from 28m (JD067); and,
- **100.2m @ 0.7g/t Pd**, 0.1g/t Pt, 0.2% Ni, 0.1% Cu, 0.02% Co from 29.5m (JD076).

Forward plan

Chalice's Julimar Project strategy is to concurrently advance studies for an initial development at Gonneville and to define the full extent of mineralisation along the >26km long Julimar Complex.

Ongoing and planned activities at Julimar include:

- **Resource definition drilling (Gonneville)** – RC/diamond drilling on a nominal 40m x 40m spaced grid is expected to continue until ~Q1 2022, subject to results. The Company anticipates that its maiden Mineral Resource Estimate will be released in Q4 2021. Several deep geological holes are also planned in the current quarter to test the down-plunge extension of the high-grade zones towards the north-west.
- **Geotechnical, metallurgical, hydrogeological and infrastructure drilling (Gonneville)** – AC/RC/diamond drilling to support studies for Gonneville will commence progressively following the resource definition drill program in ~Q1 2022.
- **Metallurgical testwork (Gonneville)** – Phase 2 sequential flotation tests on high-grade sulphide composites are expected to be completed in the next quarter. Bulk flotation tests on disseminated sulphide composites and testwork to determine comminution properties of several composites has also commenced. Initial waste rock characterisation testwork continues.
- **Studies (Gonneville)** – Consultant proposals have been invited to support studies for the project, which will assess development scenarios for the Gonneville deposit. The Company anticipates that a Scoping Study for the initial stage of development at Gonneville will be completed in H1 2022.
- **Reconnaissance exploration and surveys within the Julimar State Forest** – Infill soil sampling and follow-up Moving Loop EM surveys are underway at the Baudin-Jansz-Drummond Targets within the Julimar State Forest and on private farmland. Baseline flora and fauna surveys across the Baudin-Jansz-Drummond Targets in Julimar State Forest are planned to commence in Q3 2021.
- **Reconnaissance drilling at the Hartog-Baudin Targets within the Julimar State Forest** – First-pass low-impact drilling utilising small track-mounted diamond rigs is planned to commence in late Q3 2021, subject to access and permitting approvals. A total of 72 drill sites are planned across the ~10km strike length, with the ability to drill multiple angled holes at each site. No mechanised vegetation clearance is required to complete this first pass of drilling. Dieback, cultural heritage and confirmatory spring flora surveys are planned across the Hartog-Baudin Targets in the Julimar State Forest in August-September 2021.

About the Julimar Nickel-Copper-PGE Project

The 100%-owned Julimar Nickel-Copper-PGE Project is located ~70km north-east of Perth in Western Australia. The Project was staked in early 2018 as part of Chalice's global search for high-potential nickel sulphide exploration opportunities.

Chalice interpreted the possible presence of a mafic-ultramafic layered intrusive complex at Julimar based on high-resolution regional magnetics (the Julimar Complex). An initial RC drill program commenced in Q1 2020 at the southern end of the Complex on private farmland and resulted in the discovery of high-grade PGE-nickel-copper-cobalt-gold mineralisation.

The significant discovery (named Gonneville) established the new West Yilgarn Ni-Cu-PGE Province in Western Australia, which is interpreted to extend for ~1,200km along the western margin of the Yilgarn Craton.

The Julimar Complex is interpreted to be >26km long and is still largely undrilled, as such the project is considered highly prospective for further orthomagmatic nickel, copper and platinum group element (PGE) discoveries.

Drilling to date at Gonneville has established that the ~1.8km x 0.9km Intrusion on private farmland hosts at least 12 shallow, wide zones of high-grade PGE-Ni-Cu-Co+/-Au sulphide mineralisation in fresh rock, a substantial PGE-rich oxide zone, as well as widespread zones of PGE-dominant mineralisation associated with disseminated sulphides. The Gonneville Intrusion remains open to the north and has been confirmed to extend beyond a depth of ~800m (open at depth).

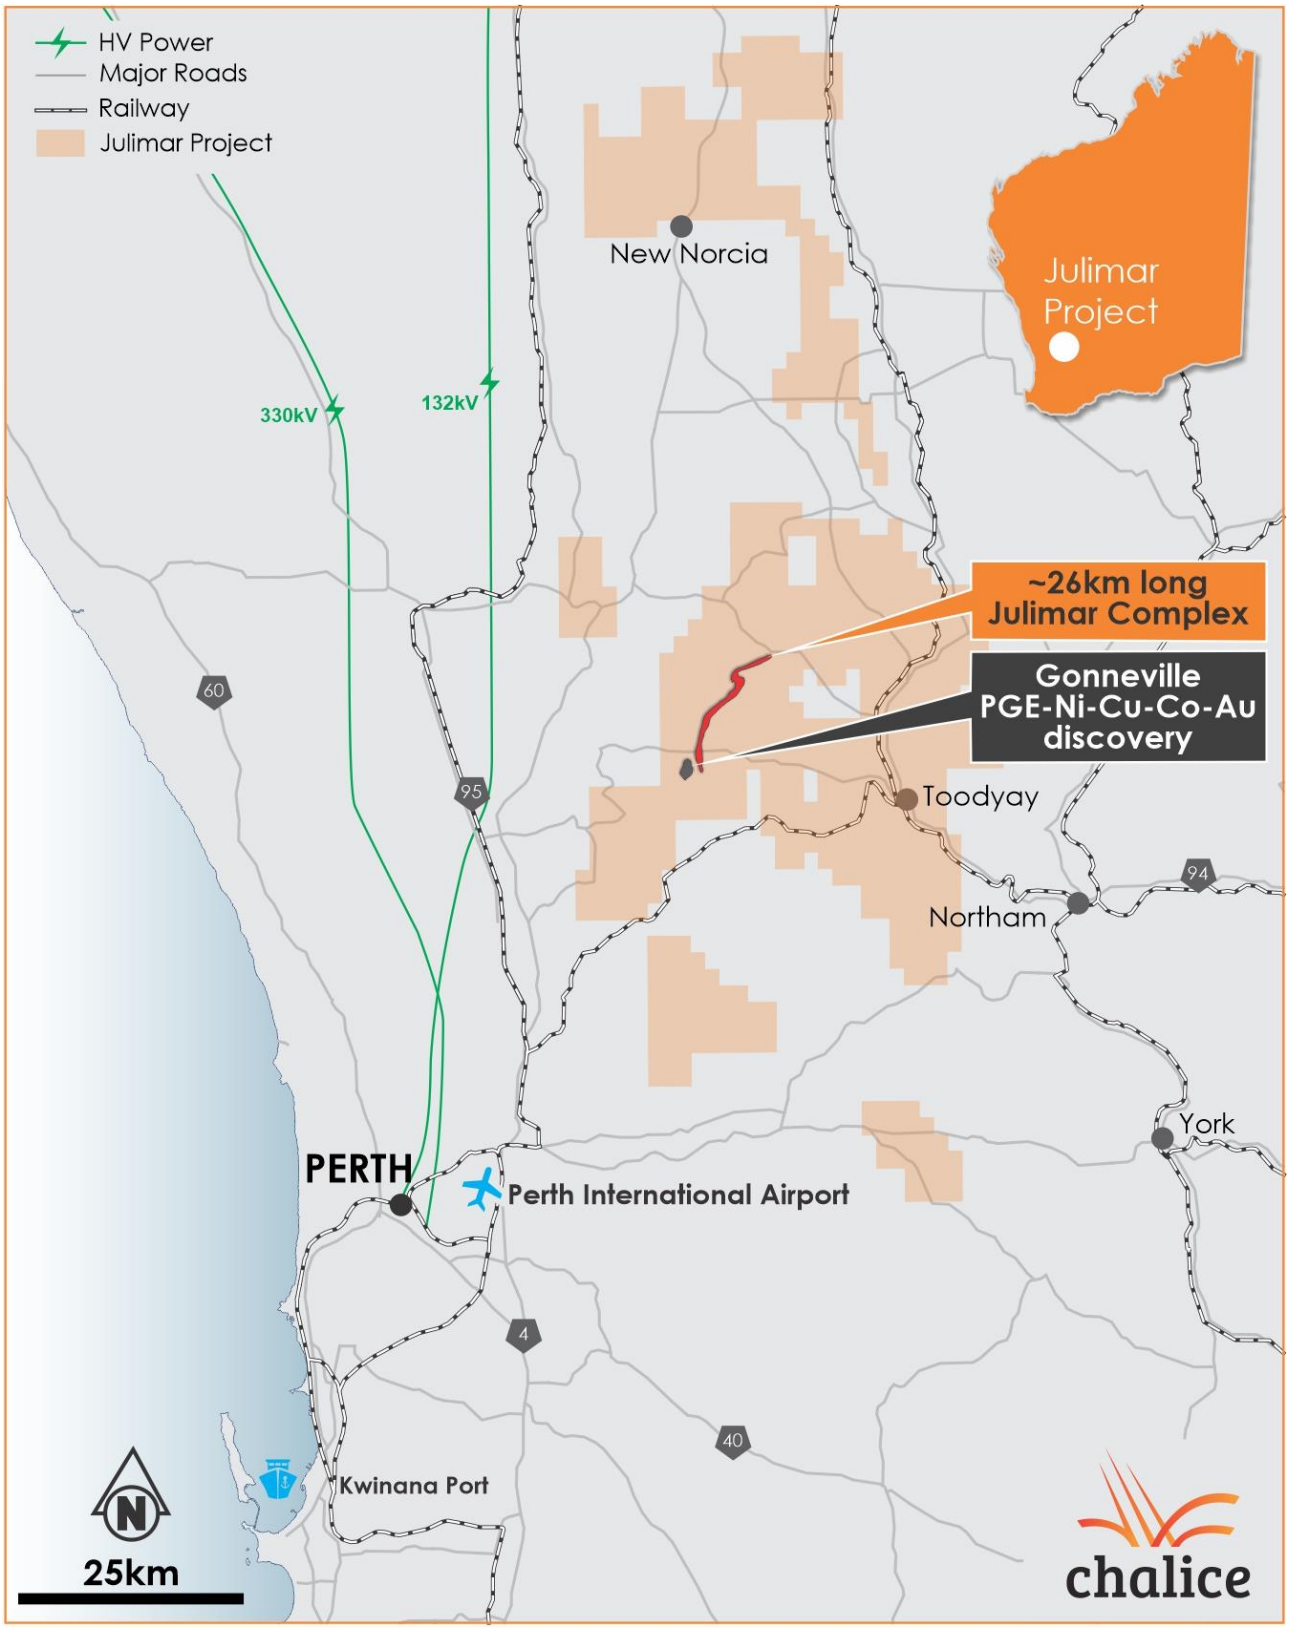

Figure 4. Julimar Complex, Gonneville discovery, Project tenure and nearby infrastructure.

Competent Persons and Qualifying Persons Statement

The information in this announcement that relates to Exploration Results in relation to the Julimar Nickel-Copper-PGE Project is based on and fairly represents information and supporting documentation compiled by Mr. Bruce Kendall BSc (Hons), a Competent Person, who is a Member of the Australian Institute of Geoscientists. Mr. Kendall is a full-time employee of the Company and has sufficient experience that is relevant to the activity being undertaken to qualify as a Competent Person as defined in the 2012 edition of the Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves, and is a Qualified Person under National Instrument 43-101 – 'Standards of Disclosure for Mineral Projects'. The Qualified Person has verified the data disclosed in this release, including sampling, analytical and test data underlying the information contained in this release. Mr Kendall consents to the inclusion in the announcement of the matters based on his information in the form and context in which it appears.

The Information in this announcement that relates to prior exploration results for the Julimar Project is extracted from ASX announcements available to view on the Company's website at www.chalicemining.com. The Company confirms that it is not aware of any new information or data that materially affects the exploration results included in the relevant original market announcements. The Company confirms that the form and context in which the Competent Person and Qualified Person's findings are presented have not been materially modified from the relevant original market announcements.

Forward Looking Statements

This announcement may contain forward-looking information, including forward looking information within the meaning of Canadian securities legislation and forward-looking statements within the meaning of the United States Private Securities Litigation Reform Act of 1995 (collectively, forward-looking statements). These forward-looking statements are made as of the date of this report and Chalice Mining Limited (the Company) does not intend, and does not assume any obligation, to update these forward-looking statements.

Forward-looking statements relate to future events or future performance and reflect Company management's expectations or beliefs regarding future events and include, but are not limited to, the Company's strategy, the completion of the intended demerger, the estimated timing of drilling in the Julimar State Forest, the fair value of investments ultimately realised, the estimation of mineral reserves and mineral resources, the realisation of mineral resource estimates, estimation of metallurgical recoveries, the forecast timing of the estimation of mineral resources, the likelihood of exploration success at the Company's projects, the prospectivity of the Company's exploration projects, the existence of additional EM anomalies within the Julimar Project, the forecast timing of the completion of the Gonneville Scoping Study, the timing of future exploration activities on the Company's exploration projects, planned expenditures and budgets and the execution thereof, the timing and availability of drill results, potential sites for additional drilling, the timing and amount of estimated future production, costs of production, capital expenditures, success of mining operations, environmental risks, unanticipated reclamation expenses, title disputes or claims and limitations on insurance coverage.

In certain cases, forward-looking statements can be identified by the use of words such as, "anticipates", "considered", "expected", "highly", "interpreted", "likely", "may", "plan" or "planned", "potential", "robust", "will" or variations of such words and phrases or statements that certain actions, events or results may, could, would, might or will be taken, occur or be achieved or the negative of these terms or comparable terminology. By their very nature forward-looking statements involve known and unknown risks, uncertainties and other factors which may cause the actual results, performance or achievements of the Company to be materially different from any future results, performance or achievements expressed or implied by the forward-looking statements.

Such factors may include, among others, risks related to actual results of current or planned exploration activities; assay results of soil samples; whether geophysical and geochemical anomalies are related to economic mineralisation or some other feature; obtaining appropriate access to undertake additional ground disturbing exploration work on EM anomalies located in the Julimar State Forrest; the results from testing EM anomalies; results of planned metallurgical test work Including results from other zones not tested yet, scaling up to commercial operations; changes in project parameters as plans continue to be refined; changes in exploration programs and budgets based upon the results of exploration, future prices of mineral resources; grade or recovery rates; accidents, labour disputes and other risks of the mining industry; delays in obtaining governmental approvals or financing or in the completion of development or construction activities; movements in the share price of investments and the timing and proceeds realised on future disposals of investments, the impact of the COVID 19 epidemic as well as those factors detailed from time to time in the Company's interim and annual financial statements, all of which are filed and available for review on SEDAR at sedar.com, ASX at asx.com.au and OTC Markets at otcmarkets.com.

Although the Company has attempted to identify important factors that could cause actual actions, events or results to differ materially from those described in forward-looking statements, there may be other factors that cause actions, events or results not to be as anticipated, estimated or intended. There can be no assurance that forward-looking statements will prove to be accurate, as actual results and future events could differ materially from those anticipated in such statements. Accordingly, readers should not place undue reliance on forward-looking statements.

Appendix A Drilling and assay data

Table 2. Significant new drill intersections (>0.3g/t Pd, >1g/t Pd, >1g/t Pd & >0.5% Ni+Cu cut-off)

NSA = No significant assay

Appendix B JORC Table 1

B-1 Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	• Nature and quality of sampling (eg. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. • Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. • Aspects of the determination of mineralisation that are Material to the Public Report. • In cases where 'industry standard' work has been done this would be relatively simple (eg. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg. submarine nodules) may warrant disclosure of detailed information.	• Diamond drill core samples were taken over selective intervals ranging from 0.2m to 1.2m (typically 1.0m). Qualitative care taken when sampling diamond drill core to sample the same half of the drill core. • Reverse Circulation (RC) drilling samples were collected as 1m samples. Two 1m assay samples were collected as a split from the rig cyclone using a cone splitter and are typically 3kg in weight.
Drilling techniques	• Drill type (eg. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	• Drilling has been undertaken by diamond and Reverse Circulation (RC) techniques. • Diamond drill core is predominantly HQ size (63.5mm diameter). Limited NQ (47.6mm diameter) drilling has also been completed. Triple tube has been used from surface until competent bedrock and then standard tube thereafter. • Core orientation is by an ACT Reflex (ACT II RD) tool • RC Drilling uses a face-sampling hammer drill bit with a diameter of 5.5 inches (140mm).
Drill sample recovery	• Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to	• Individual recoveries of diamond drill core samples were recorded on a qualitative basis. Generally sample weights are comparable, and any bias is considered negligible. • Individual recoveries for RC composite samples were recorded on a qualitative basis. Sample weights were slightly lower through transported cover whereas drilling through bedrock

Criteria	JORC Code explanation	Commentary
	preferential loss/gain of fine/coarse material.	yielded samples with more consistent weights. • No relationships have been evident between diamond core or RC sample grade and recoveries.
Logging	• Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged.	• All drill holes were logged geologically including, but not limited to; weathering, regolith, lithology, structure, texture, alteration and mineralisation. Logging was at an appropriate quantitative standard for infill drilling and resource estimation. • Logging is considered qualitative in nature. • All holes were geologically logged in full. • Diamond drill core is photographed wet before cutting.
Sub-sampling techniques and sample preparation	• If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled.	• Diamond core was sawn in half and one-half quartered and sampled over 0.2-1.2m intervals (mostly 1m). • Diamond drill core field duplicates collected as ¼ core. • RC assay samples were collected as two 1m splits from the rig cyclone via a cone splitter. The cone splitter was horizontal to ensure sample representivity. Wet or damp samples were noted in the sample logging sheet. A majority of samples were dry. • Sample preparation is industry standard and comprises oven drying, jaw crushing and pulverising to -75 microns (80% pass). • Field duplicates were collected from selected sulphide zones as a second 1m split directly from the cone splitter. • Drill sample sizes are considered appropriate for the style of mineralisation sought and the nature of the drilling program.
Quality of assay data and laboratory tests	• The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (eg. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie. lack of bias) and precision have been established.	• Diamond drill core and RC samples underwent sample preparation and geochemical analysis by ALS Perth. Au-Pt-Pd was analysed by 50g fire assay fusion with an ICP-AES finish (ALS Method code PGM-ICP24). A 48-element suite was analysed by ICP-MS following a four-acid digest (ALS method code ME-MS61) for holes up to and including JD023 and JRC122. Later holes were analysed using four-acid digest for 34 elements (ALS method code ME-ICP61) including Ag, Al, As, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Ga, K, La, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sr, Th, Ti, Tl, U, V, W, Zn, Zr. Additional ore-grade analysis was performed as

Criteria	JORC Code explanation	Commentary
		required for elements reporting out of range for Ni, Cr, Cu (ALS method code ME-OG-62) and Pd, Pt (ALS method code PGM-ICP27). • Certified analytical standards and blanks were inserted at appropriate intervals for diamond, RC drill samples and auger soil samples. Approximately 5% of significant intercepts were sent for cross laboratory checks. All QAQC samples display results within acceptable levels of accuracy • Approximately 5% of samples submitted for analysis comprised QAQC control samples.
Verification of sampling and assaying	• The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. • Discuss any adjustment to assay data.	• Significant drill intersections are checked by the Project Geologist and then by the General Manager Development. Significant intersections are cross-checked with the logged geology and drill core after final assays are received. • Three RC holes have been twinned with a diamond hole to provide a comparison between grade/thickness variations over a 5m separation between drill holes. • Primary drill data was collected digitally using OCRIS software before being transferred to the master SQL database. • No adjustments were made to the assay data
Location of data points	• Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control.	• Diamond and RC drill hole collar locations are initially recorded by Chalice employees using a handheld GPS with a +/- 3m margin of error. • RTK-DGPS collar pick-ups replace handheld GPS collar pick-ups and have +/-20 mm margin of error. • The grid system used for the location of all drill holes is GDA94 - MGA (Zone 50). • RLs for reported holes were derived from RTK-DGPS pick-ups.
Data spacing and distribution	• Data spacing for reporting of Exploration Results. • Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied.	• Drill hole spacing varies from between 40m x 40 m in the south to 160m x 80m in the north. • Results from the drilling to date are not considered sufficient to assume any geological or grade continuity appropriate for Mineral Resource estimation procedure(s) and classifications. • No compositing undertaken for diamond drill core or RC samples.
Orientation of data in	• Whether the orientation of sampling achieves unbiased sampling of possible	• RC and Diamond drill holes were typically oriented within 15° of

Criteria	JORC Code explanation	Commentary
relation to geological structure	structures and the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	orthogonal to the interpreted dip and strike of the known zone of mineralisation. However, several holes were drilled at less optimal azimuths due to site access constraints or to test for alternative mineralisation orientations. Only holes JD064 and JD072 in this release were not drilled within 15° of orthogonal to the interpreted dip and strike of the known zone of mineralisation • The orientation of the drilling is not considered to have introduced sampling bias
Sample security	• The measures taken to ensure sample security.	• Samples are collected in polyweave bags and delivered directly from site to ALS laboratories in Wangara, Perth by a Chalice contractor
Audits or reviews	• The results of any audits or reviews of sampling techniques and data.	• No review has been carried out to date.

B-2 Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. • The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	• Exploration activities are ongoing over E70/5118 and 5119 and the tenements are in good standing. The holder CGM (WA) Pty Ltd is a wholly owned subsidiary of Chalice Mining Limited with no known encumbrances • Current drilling is on private land • E70/5119 partially overlaps ML1SA, a State Agreement covering Bauxite mineral rights only
Exploration done by other parties	• Acknowledgment and appraisal of exploration by other parties.	• Limited exploration has been completed by other exploration parties in the vicinity of the targets identified by Chalice to date. • Chalice has compiled historical records dating back to the early 1960's which indicate only three genuine explorers in the area, all primarily targeting Fe-Ti-V mineralisation. • Over 1971-1972, Garrick Agnew Pty Ltd undertook reconnaissance surface sampling over prominent aeromagnetic anomalies in a search for 'Coates deposit style' vanadium mineralisation. Surface sampling methodology is not described in detail, nor were analytical methods specified, with samples analysed for V2O5, Ni, Cu, Cr, Pb and Zn, results of which are referred to in this announcement. • Three diamond holes were completed by Bestbet Pty Ltd targeting Fe-Ti-V

Criteria	JORC Code explanation	Commentary
		situated approximately 3km NE of JRC001. No elevated Ni-Cu-PGE assays were reported. • Bestbet Pty Ltd undertook 27 stream sediment samples within E70/5119. Elevated levels of palladium were noted in the coarse fraction (-5mm+2mm) are reported in this release. Finer fraction samples did not replicate the coarse fraction results. • A local AMAG survey was flown in 1996 by Alcoa using 200m line spacing which has been used by Chalice for targeting purposes.
Geology	• Deposit type, geological setting and style of mineralisation.	• The target deposit type is a magmatic Ni-Cu-PGE sulphide deposit, within the Yilgarn Craton. The style of sulphide mineralisation intersected consists of massive, matrix, stringer and disseminated sulphides typical of metamorphosed and structurally overprinted magmatic Ni sulphide deposits.
Drill hole Information	• A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: • easting and northing of the drill hole collar • elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar • dip and azimuth of the hole • down hole length and interception depth • hole length. • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	• Provided in body of text • No material information has been excluded.
Data aggregation methods	• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg. cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	• Significant intercepts are reported using a >0.3g/t Pd length-weighted cut off. A maximum of 4m internal dilution has been applied. • Higher grade intervals are reported using a >1.0g/t Pd and >1.0g/t Pd & >0.5% Ni+Cu length-weighted cut off. A maximum of 2m internal dilution has been applied. • Metal equivalent values are not reported.

Criteria	JORC Code explanation	Commentary
	• The assumptions used for any reporting of metal equivalent values should be clearly stated.	
Relationship between mineralisation widths and intercept lengths	• These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg. 'down hole length, true width not known').	• All widths are quoted down-hole. • All drill holes were orientated to be as close as possible to orthogonal to the interpreted strike and/or dip of the mineralised zone(s) and/or targets. Within this release holes JD064 and JD072 were drilled to test for potential different mineralisation orientations and hence weren't drilled orthogonal to the interpreted strike and/or dip of the mineralised zone(s).
Diagrams	• Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	• Refer to figures in the body of text.
Balanced reporting	• Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	• All holes including those without significant intercepts have been reported.
Other substantive exploration data	• Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	• Not applicable
Further work	• The nature and scale of planned further work (eg. tests for lateral extensions or depth extensions or large-scale step-out drilling). • Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	• Diamond and RC drilling will continue to test high-priority targets including EM conductors. Further drilling along strike and down dip may occur at these and other targets depending on results. • Down-hole EM surveying will be carried out on selective drill holes to test for off-hole conductors. Subsequent holes will undergo down-hole EM if required. • Any potential extensions to mineralisation are shown in the figures in the body of the text.
