

Excellent RC Drill Assay Results from Inaugural Drill Program at Burracoppin Gold Project, WA

Highlights:

- Shallow high-grade gold intersected in inaugural drilling program at the Burracoppin Gold Project, located along strike of Ramelius Resources Edna May Gold Mine in the eastern wheatbelt of Western Australia
- Assay results from the Phase I drilling program has identified mineralisation below and along strike of the historic workings at Burracoppin, as well as identifying a new and unexplored mineralised unit east of the current system
- Assay results include:
 - Benbur West Area – Below historic leach pad
 - 4m @ 4.27 g/t Au from 25m in ABRC010, including
 - 2m @ 7.88 g/t Au from 25m; and
 - 1m @ 14.60 g/t Au from 26m
 - 2m @ 2.38 g/t Au from 22m in ABRC013, including
 - 1m @ 4.01 g/t Au from 22m
 - Benbur Area
 - 2m @ 2.03 g/t Au from 16m in ABRC008, including
 - 1m @ 3.07 g/t Au from 16m
 - 3m @ 1.58 g/t Au from 102m in ABRC006
 - Christmas Gift Area
 - 3m @ 3.57 g/t Au from 40m in ABRC005, including
 - 1m @ 7.40 g/t Au from 40m; and
 - 1m @ 2.99 g/t Au from 42m
 - Easter Gift Area
 - 1m @ 2.95 g/t Au from 19m in ABRC015
 - Lone Tree Area
 - 3m @ 1.21 g/t Au from 15m in ABRC018
- Several drill holes intercepted mineralisation greater than 1 g/t Au indicating the presence of a potentially large gold endowment at the Burracoppin Gold Project
- Total potential strike of the mineralisation almost 1.7 km from north to south
- Work is currently underway on a follow up exploration drilling program designed to further test those high priority areas identified during the Phase I drilling campaign and other targets identified from interpretation geophysical structures

Askari Metals Limited (**ASX: AS2**) (“Askari Metals” or “Company”), an Australia based exploration company with a portfolio of copper and gold projects across Western Australia and New South Wales, is pleased to announce the results of the inaugural drill campaign at

Projects	
Springdale Copper-Gold Project (Cu/Au)	100% owned
Horry Copper Project (Cu)	100% owned
Callawa Copper Project (Cu)	100% owned
Burracoppin Gold Project (Au)	100% owned
Mt Maguire Gold & Base Metal Project (Au)	100% owned

the Company's 100% owned Burracoppin Gold Project located in the eastern wheatbelt of Western Australia along strike from the Ramelius Resources Edna May Gold Mine. The Company drilled a total of seventeen (17) Reverse Circulation (RC) drill holes for 1,424 meters commenced which was completed in mid-August 2021.

The Phase I drilling program was designed to target mineralised zones and their extensions associated with historic workings. It aimed to provide not only an indication of the gold mineralisation in the area but also the geological and mineralogical relationships beneath the historic workings and the outcropping and sub-cropping mineralisation. The assay results from this first phase of drilling include very encouraging results and indicates that there is high-grade gold mineralisation present across the Burracoppin Project. The drilling has also defined that the gold mineralisation is shallow and appears to be coincident with geophysical magnetic features which are associated with major structures across the project area.

With the Phase I assay results received, the Company will now complete its interpretation and combined with the outcome of its further analysis of the geophysical data will plan the next phase of exploration.

Vice President - Exploration and Geology, Mr Johan Lambrechts, commented:

"These results are very encouraging and highlight the potential for further mineralisation associated with the historic workings and on separate structures in the project area. We are busy analysing the data in more detail, in conjunction with geophysical interpretations and other datasets. The follow-up exploration design will commence soon and promises for a thrilling next phase of work."

Overview

The Burracoppin Gold Project is located approximately 20km east of Merredin and 15km west of the Edna May Gold Mine in the eastern wheat belt of Western Australia.

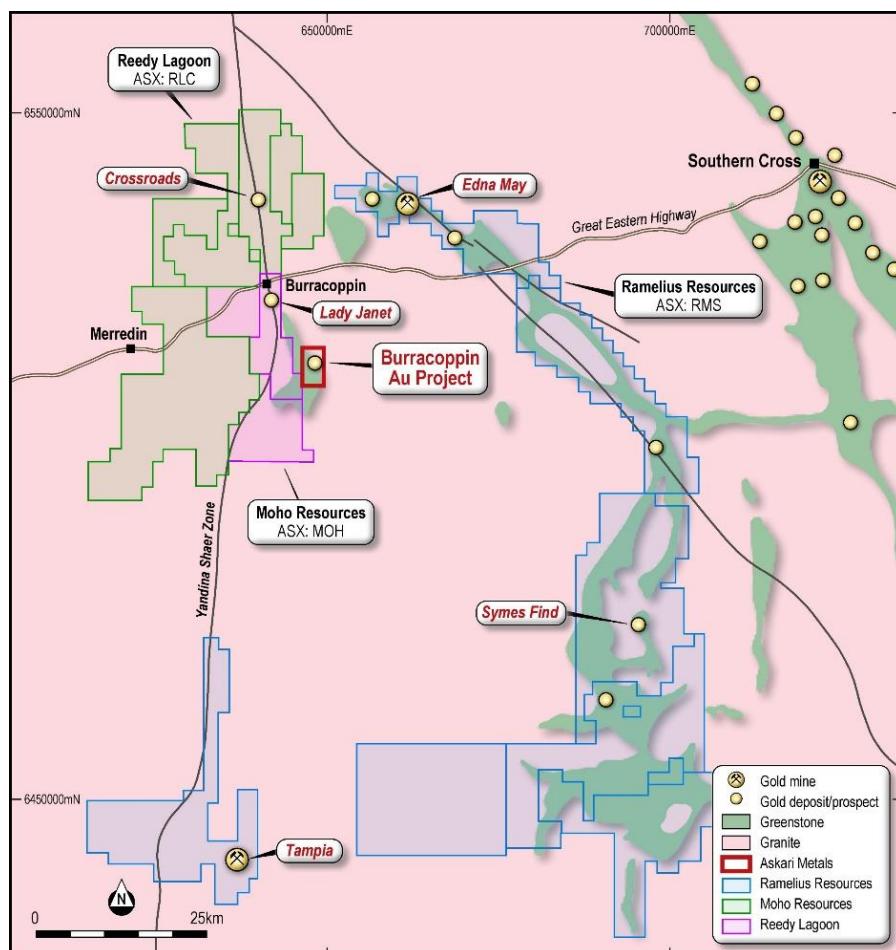

Figure 1: Locality map of the Burracoppin Project

** This announcement is authorised by the executive board on behalf of the Company **

The area is dominated by gently undulating topography with isolated lateritic breakaways preserved on an intensely developed regolith. It is underlain by Archaean granite/gneiss greenstone terrane metamorphosed to amphibolite/granulite grade. Minor banded iron formation outcrops are known, and aplite-pegmatite dykes intrude the amphibolites at the Burgess Find gold workings.

Burges Find, Christmas Gift, Benbur and Easter Gift were the four main areas mined at the Burracoppin Project (*refer to Figure 2*). The Burgess Find, Christmas Gift and Benbur mines reported historical production figures of 410 tonnes, 750 tonnes and 1,030 tonnes respectively. Production of the original miners in the 1930s was reported in the “Daily News” newspaper (June 1933), which wrote that the first parcel processed from Burracoppin had produced gold grades of 49g/t Au.

The workings targeted mineralisation hosted in narrow, vertically dipping veins that occur within a gabbro dyke at or close to its western margin in pelitic sediments. The veins and gabbro strike north-south and are folded into a series of open folds. The Easter Gift workings occur in mafic granulite and metasediments and occupy a similar stratigraphic position to that of the Christmas Gift-Benbur North-Benbur workings to the north.

Laterites that cover the Archaean rock sequence also carry gold mineralisation. The laterite consists of loose pisolithes with a significant sand matrix component at the surface, grading into a poorly to well cemented nodular laterite layer. Gold mineralisation appears to be restricted to the iron-rich laterites.

Discussion of Results

Seventeen holes were drilled in four main areas targeting local strike, and dip extensions of the mineralised lodes mined historically. Two regions distant from the main workings were also targeted (west of Benbur and the South-Eastern / Lone Tree workings).

The results from this Phase I drilling program and their implication on the future exploration plans for Burracoppin are currently being reviewed in detail, in conjunction with geophysical data. The next steps in the Burracoppin exploration plan will be finalised and reported to shareholders over the coming weeks.

Significant shallow high-grade gold mineralisation has been encountered in the drilling at Burracoppin with assay results including:

- Benbur West Area – Below historic leach pad
 - 4m @ 4.27 g/t Au from 25m in ABRC010, including
 - 2m @ 7.88 g/t Au from 25m; and
 - 1m @ 14.60 g/t Au from 26m
 - 2m @ 2.38 g/t Au from 22m in ABRC013, including
 - 1m @ 4.01 g/t Au from 22m
- Benbur Area
 - 2m @ 2.03 g/t Au from 16m in ABRC008, including
 - 1m @ 3.07 g/t Au from 16m
 - 3m @ 1.58 g/t Au from 102m in ABRC006
- Christmas Gift Area
 - 3m @ 3.57 g/t Au from 40m in ABRC005, including
 - 1m @ 7.40 g/t Au from 40m; and
 - 1m @ 2.99 g/t Au from 42m
- Easter Gift Area
 - 1m @ 2.95 g/t Au from 19m in ABRC015
- Lone Tree Area
 - 3m @ 1.21 g/t Au from 15m in ABRC018

Significantly, the overall strike length of the mineralisation between Burgess Find in the north and Benbur is about 650 m while Easter Gift is a further 1.3 km south of Benbur. This suggests that the total potential strike of the mineralisation almost 1.7 km from north to south. The South-Eastern Area (Lone Tree) is another 850 m to the southeast of the Easter Gift workings and represents a separate mineralised structure which has only been discovered during this Phase I drilling program and has not been adequately drill tested.

This will be investigated by follow up drilling and has the potential to positively change the size and scale of the Burracoppin project significantly.

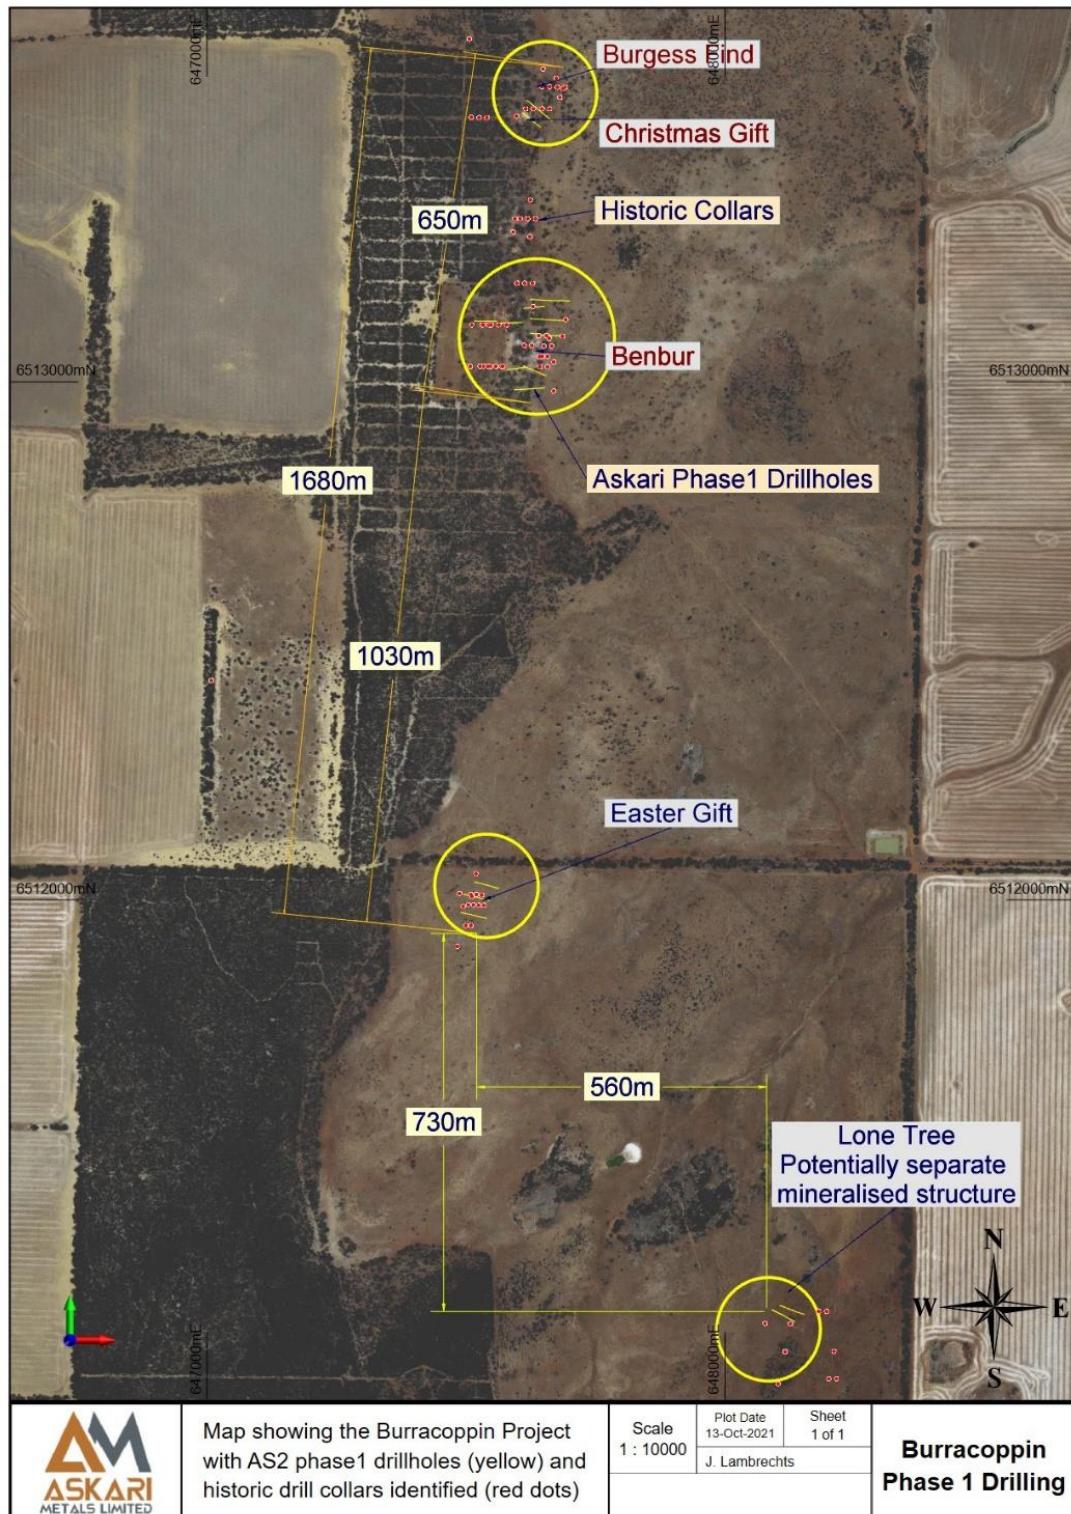

Figure 2: Map indicating the drilling completed during Phase I at Burracoppin

** This announcement is authorised by the executive board on behalf of the Company **

Christmas Gift

Two holes were completed in the Christmas Gift area with ABRC005 intercepting 3m at 3.75 g/t Au from 40m downhole. This intersection also included 1m at 7.40 g/t Au from 40m and 1m @ 2.99g/t Au from 42m. This intersection is a down dip extension of mineralisation previously intersected at this location in the historical drilling (refer to Figure 3).

ABRC004 also intersected the mineralised lode, but with significantly reduced gold grade. This short grade continuity is a common characteristic of epithermal gold deposits and the orientation of the high-grade shoot will be a target of the follow up exploration plan at Burracoppin.

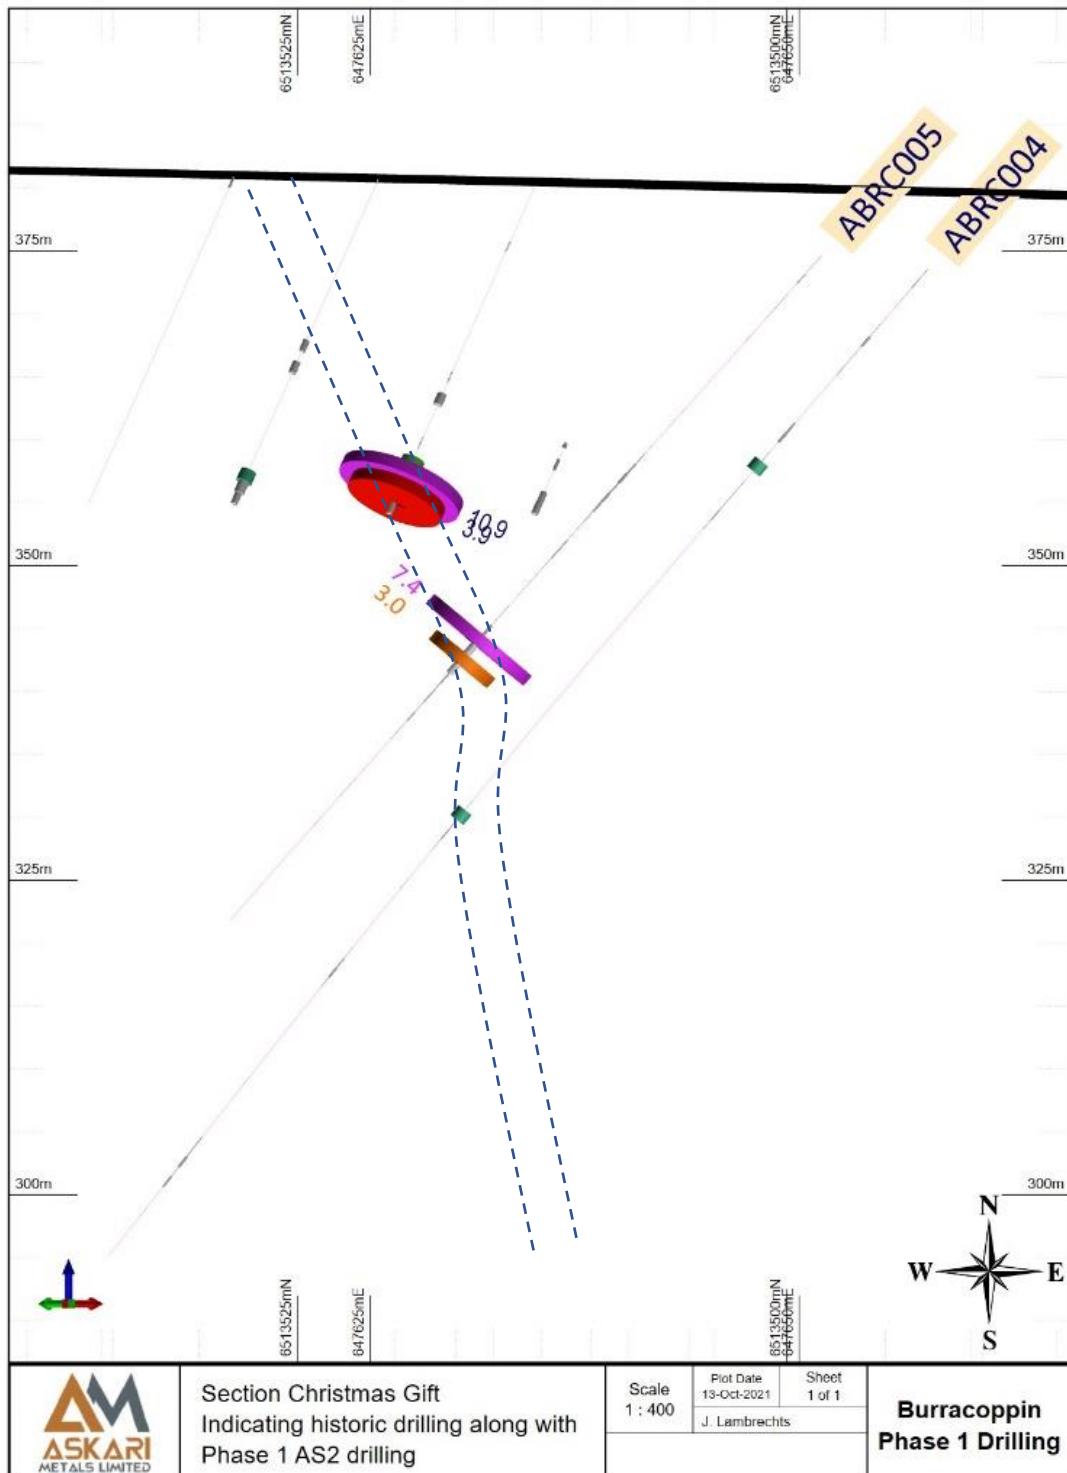

Figure 3: Section through Christmas Gift area indicating the phase1 AS2 drillhole data

**** This announcement is authorised by the executive board on behalf of the Company ****

Benbur

Benbur produced multiple good intersections from a total of seven (7) holes drilled into the prospect testing strike extent and historic intercepts below the workings.

ABRC008 produced 2m at 2.03 g/t Au from 16m, including 1m at 3.07 g/t Au from 16m. It also returned 1m at 1.01 g/t Au from 12m indicating two separate mineralised units in the area.

ABRC006 returned results of 3m at 1.58 g/t Au from 102m and also 1m at 1.04 g/t Au from 81m intersecting the same two units as ABRC008, but at greater depth (refer to Figure 4).

ABRC011 returned 1m at 1.33 g/t Au from 15m, but this sample is part of a 5m wide intersection with an average grade of 0.90 g/t Au from 11m.

ABRC007 produced 1m at 1.16 g/t Au from 63m, and ABRC014 returned 1m at 1.08 g/t Au from 22m.

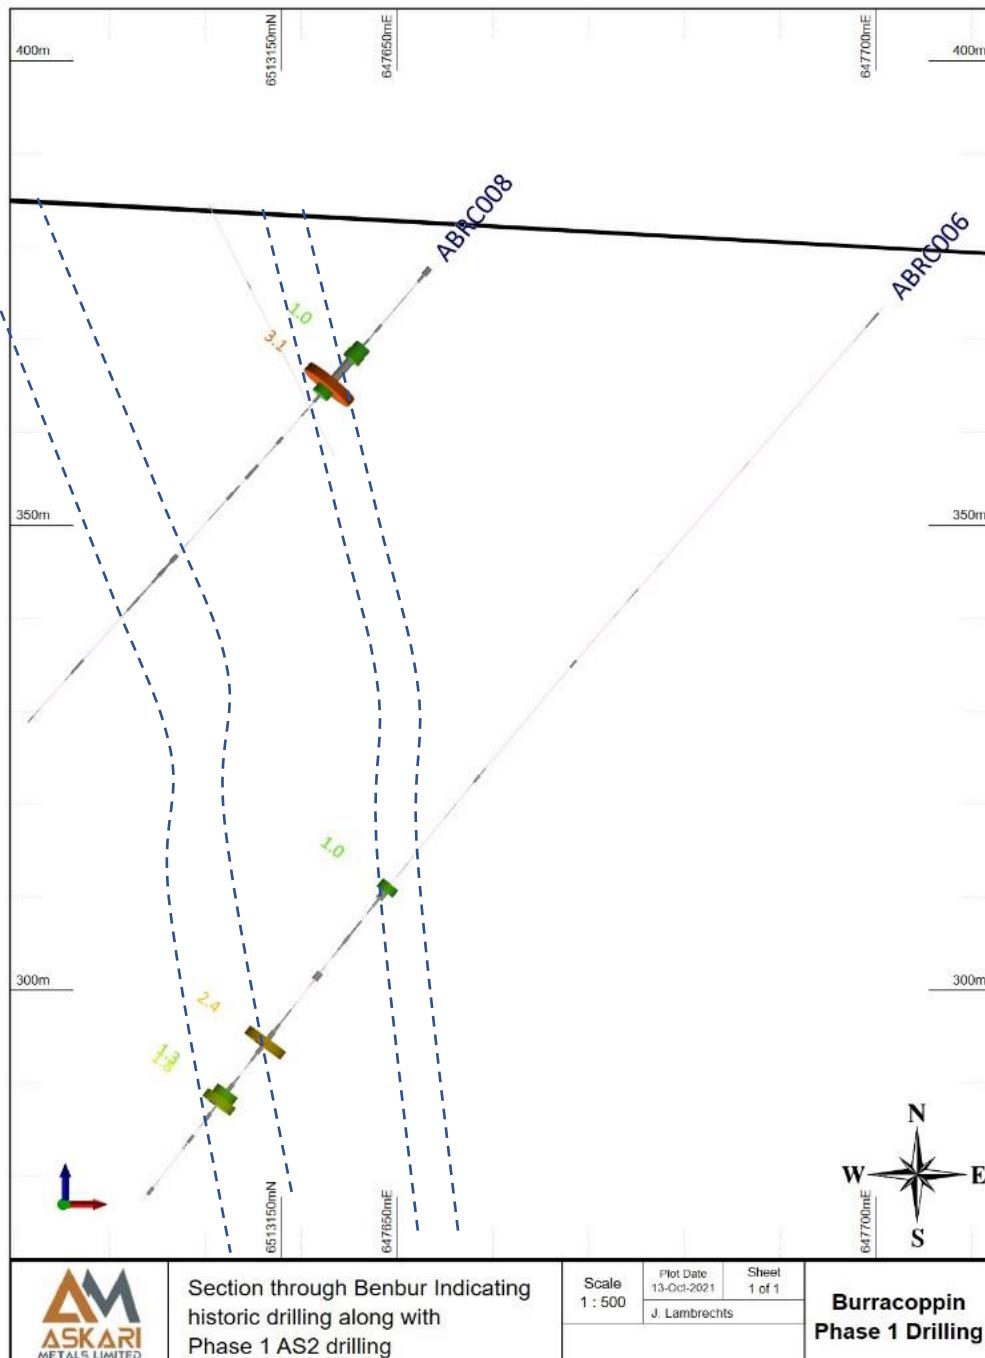

Figure 4: Section through Benbur area indicating the Phase 1 AS2 drillhole data

** This announcement is authorised by the executive board on behalf of the Company **

Benbur-West

The drilling in this area included two holes designed to test shallow historic intercepts to the west of the main Bebur shaft.

ABRC010 returned excellent results of 4m at 4.27 g/t Au from 25m which included 2m at 7.88 g/t Au from 25m and 1m at 14.60 g/t Au from 26m downhole, while ABRC013 returned similarly exciting results of 2m at 2.38 g/t Au from 22m which included 1m at 4.01 g/t Au from 22m.

These intersections represent validation of the historical results as well as deeper intercepts increasing the known down-dip extent of the mineralisation.

Easter Gift

Easter Gift is a historic shaft to the south of Benbur. There are several historical holes that intersected mineralisation at shallow depths, and the recent drilling completed by Askari was designed to validate the mineralisation.

ABRC015 intersected the lode with a result of 1m at 2.95 g/t Au from 19m, while ABRC017 intersected the same mineralised unit with 1m at 1.97 g/t Au from 26m.

Lone Tree

The Lone Tree area is removed from the main shafts and includes a small and isolated vertical working. The drilling completed by Askari in this area was designed to identify the mineralised horizon and host lithology since there is minimal historical data.

Two holes were drilled in a scissor configuration, and ABRC018 returned exceptional results of 4m at 1.07 g/t Au from 14m. The mineralised zone also included intercepts of 1m at 1.16 g/t Au from 15m and 1m at 1.63 g/t Au from 17m. Deeper in the hole, the drilling also intersected 1m at 1.19 g/t Au from 59m.

This opens up exploration opportunities on a separate and untested structure to the one hosting the shafts and historic workings to the west and, therefore, may represent significant strike extensional potential.

Table 1 below depicts the results for gold and its generic trace elements discussed in the announcement.

Table 1: Table depicting a summary of the results discussed in the announcement.

About Askari Metals Limited

Askari Metals was incorporated for the primary purpose of acquiring, exploring and developing high-grade gold and copper-gold projects in **New South Wales and Western Australia**. The Company has assembled an attractive portfolio of gold and copper-gold exploration/mineral resource development projects in Western Australia and New South Wales.

Caution Regarding Forward-Looking Information

This document contains forward-looking statements concerning Askari Metals Limited. Forward-looking statements are not statements of historical fact and actual events and results may differ materially from those described in the forward-looking statements as a result of a variety of risks, uncertainties and other factors. Forward-looking statements are inherently subject to business, economic, competitive, political and social uncertainties and contingencies. Many factors could cause the Company's actual results to differ materially from those expressed or implied in any forward-looking information provided by the Company, or on behalf of, the Company. Such factors include, among other things, risks relating to additional funding requirements, metal prices, exploration, development and operating risks, competition, production risks, regulatory restrictions, including environmental regulation and liability and potential title disputes.

Forward looking statements in this document are based on the company's beliefs, opinions and estimates of Askari Metals Limited as of the dates the forward-looking statements are made, and no obligation is assumed to update forward looking statements if these beliefs, opinions and estimates should change or to reflect other future developments.

Competent Person Statement

The information in this report that relates to Exploration Targets, Exploration Results or Mineral Resources is based on information compiled by Johan Lambrechts, a Competent Person who is a Member of the Australian Institute of Geoscientists. Mr. Lambrechts is a full-time employee of Askari Metals Limited, who has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr. Lambrechts consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Appendix 1 – JORC Code, 2012 Edition, Table 1 report
Section 1 Sampling Techniques and Data (Criteria in this section applies to all succeeding sections)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> • Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. • Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. • Aspects of the determination of mineralisation that are Material to the Public Report. 	<ul style="list-style-type: none"> • All holes were sampled on a 1m down hole interval basis. <ul style="list-style-type: none"> ◦ A representation of the rock chips from each 1m interval was collected and stored in RC chip trays for later use. • Each interval was scanned with an XRF scanner and the data recorded. <u>NOTE: The XRF data collected was not used for reporting purposes</u>, but rather to inform the geologist of potential increase of trace element values, which in turn help prevent the potential of stopping the hole in unseen mineralisation. • All sampling lengths and other logging data was recorded in GRL's standard sampling record spreadsheets. Data includes from and to measurements, colour, lithology, magnetic susceptibility, structures etc. Visible sulphide content was logged as well as alteration and weathering. • Industry standard practice was used in the processing of samples for assay, with 1m intervals of RC chips collected in green plastic and calico bags.
Drilling techniques	<ul style="list-style-type: none"> • Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details. 	<ul style="list-style-type: none"> • In this program, reverse circulation (RC) percussion drill holes were used. Hole dip was -50°. • RC percussion drilling was performed with a face sampling hammer bit (bit diameter between 4½ and 5 ¼ inches) and samples were collected by a cone splitter.
Drill sample recovery	<ul style="list-style-type: none"> • Method of recording and assessing core and chip sample recoveries and results assessed. 	<ul style="list-style-type: none"> • RC drill chip sample recovery was recorded by visual estimation of the reject sample, expressed as a percentage recovery. Overall estimated recovery was high. • All samples were dry as a result of appropriate air pressure and volume and the lack of major ground water. • Measures taken to ensure maximum RC sample recoveries included maintaining a clean cyclone and drilling equipment, as well as regular communication with the drillers and slowing drill advance rates when variable to poor ground conditions are encountered.
Logging	<ul style="list-style-type: none"> • Whether core and chip samples have been geologically and geotechnically logged to a level 	<ul style="list-style-type: none"> • The drill chips were geologically logged at 1m intervals with detailed recording of lithology, alteration, mineralisation and other observations such as colour,

Criteria	JORC Code explanation	Commentary
	of detail to support appropriate Mineral Resource Estimation, mining studies and metallurgical studies.	<p>moisture and recovery. Drill chips were collected and sieved before being placed into reference chip trays for visual logging at 1m intervals.</p> <ul style="list-style-type: none"> Logging was performed at the time of drilling, and planned drill hole target lengths adjusted by the geologist during drilling. The geologist also oversaw all sampling and drilling practices. A small selection of representative chips were collected for every 1 meter interval and stored in chip-trays as well as a representative split of mineralised areas stored for potential future use.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> For all sample types, the nature, quality and appropriateness of the sample preparation technique. 	<ul style="list-style-type: none"> 1m Samples were recovered using a rig mounted cone splitter during drilling into a calico sample bag. Sample target weight was between 2 and 4kg. QAQC was employed. A standard, blank or duplicate sample was inserted into the sample stream at regular intervals and also at specific intervals based on the geologist's discretion. Standards were quantified industry standards. Duplicate samples were taken using the same sample sub sample technique as the original sub sample and inserted at the geologist's discretion. Sample sizes are appropriate for the nature of mineralisation.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	<ul style="list-style-type: none"> All AS2 samples were submitted to Bureau Veritas laboratories in Adelaide. The samples were sorted, wet weighed, dried then weighed again. Primary preparation involved crushing and splitting the sample with a riffle splitter where necessary to obtain a sub-fraction which was pulverised in a vibrating pulveriser. All coarse residues have been retained. The samples have been analysed by a 40g lead collection fire assay as well as multi acid digest with an Inductively Coupled Plasma (ICP) Optical Emission Spectrometry finish for multi elements The lab randomly inserts analytical blanks, standards and duplicates into the client sample batches for laboratory QAQC performance monitoring. AS2 also inserted Certified Reference Material (CRM) samples and blanks were inserted at least every 10 samples to assess the accuracy and reproducibility of the drill core results. All of the QAQC data has been statistically assessed to determine if results were within the certified standard deviations of the reference material. If required a batch or a portion of the batch may be re-assayed. (no re-assays required for the data in the release).
Verification of sampling and assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. Documentation of primary data, data entry procedures, data verification, data storage 	<ul style="list-style-type: none"> The lab randomly insert analytical blanks, standards and duplicates into the client sample batches for laboratory QAQC performance monitoring. AS2 also inserted QAQC samples as mentioned above All of the QAQC data has been statistically assessed, 100% of which are within acceptable QAQC limits as stated by the standard deviation stipulated on the certificate for the reference material used. This fact combined with the fact that the data is demonstrably consistent has meant that the results are considered to be acceptable and suitable for reporting.

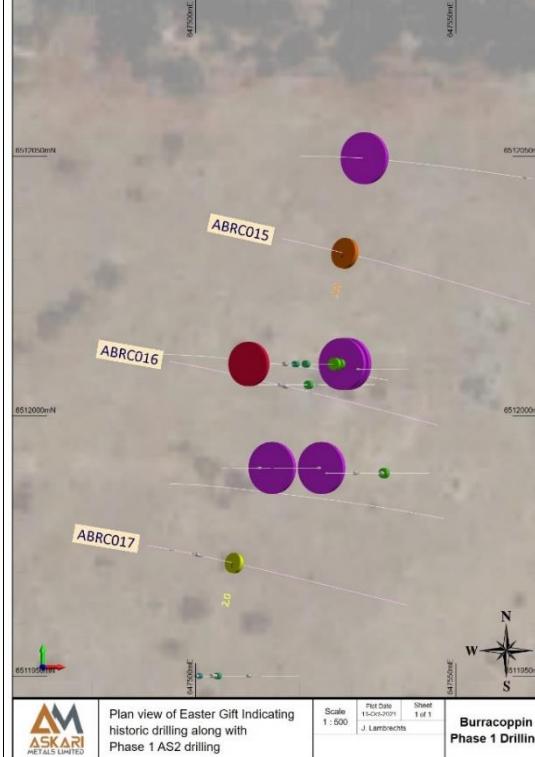

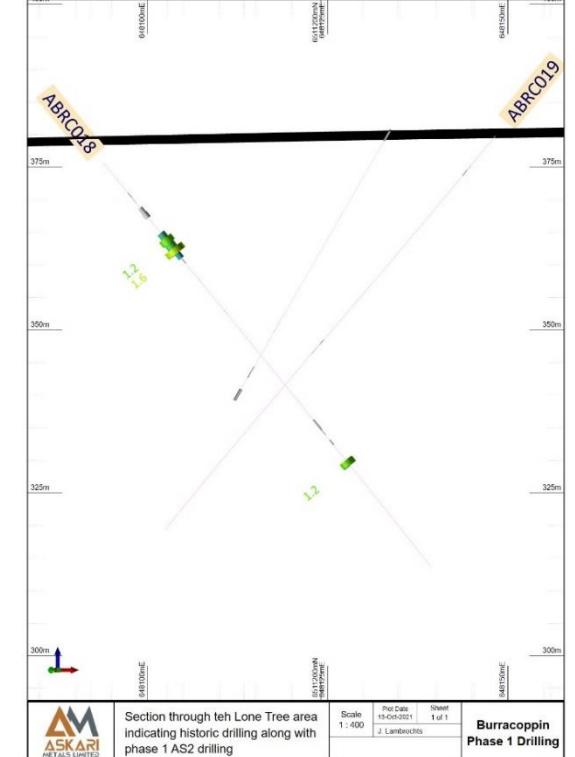

Criteria	JORC Code explanation	Commentary
	(physical and electronic) protocols. <ul style="list-style-type: none"> • Discuss any adjustment to assay data. 	
Location of data points	<ul style="list-style-type: none"> • Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. 	<ul style="list-style-type: none"> • Collar Survey - Collars were surveyed by a survey consultancy and are accurate to within a few millimetres. • Down Hole Survey - Down hole surveys were conducted using a Gyro and were also conducted by the survey consultancy
Data spacing and distribution	<ul style="list-style-type: none"> • Data spacing for reporting of Exploration Results. • Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied. 	<ul style="list-style-type: none"> • The holes in this announcement were designed to target areas with relatively sparse drill density. • Grade continuity of the targeted lodes cannot be determined from this data alone. • Compositing of sample results was applied for the announcement and details are provided in the text, a summary table and a table showing all drill intervals in appendix 3.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> • Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. 	<ul style="list-style-type: none"> • The holes were drilled perpendicular to the mapped strike of the lodes and surface outcropping lithologies and drilled from the hanging wall side toward the steeply east dipping lodes. • The orientation of the drilling is deemed appropriate and unbiased.
Sample security	<ul style="list-style-type: none"> • The measures taken to ensure sample security. 	<ul style="list-style-type: none"> • All samples were collected and accounted for by AS2 employees/consultants during drilling. All samples were bagged into calico and plastic bags and closed with cable ties. Samples were transported to Perth from the logging site by AS2 employees/ consultants and submitted to the lab using courier companies. • The appropriate manifest of sample numbers and a sample submission form containing laboratory instructions were submitted to the laboratory. Any discrepancies between sample submissions and samples received were routinely followed up and accounted for.
Audits or reviews	<ul style="list-style-type: none"> • The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> • No audits have been conducted on the historic data to our knowledge.

Section 2 Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> • Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. • The security of the tenure held at the time of reporting along with any known impediments to obtaining a license to operate in the area. 	<ul style="list-style-type: none"> • The Burracoppin Project (E70/5049) is located approximately 20km east of Merredin and 15km west of the Edna May Gold Mine in the eastern wheat belt of WA. The project is easily accessible from Merredin using the Great Eastern Highway. The Burracoppin South Road cross cuts some of the tenure. • The exploration rights to the project are owned 100% by the Askari Metals Limited through the granted exploration license E70/5049.
Exploration done by other parties	<ul style="list-style-type: none"> • Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> • See appendix 2
Geology	<ul style="list-style-type: none"> • Deposit type, geological setting and style of mineralisation. 	<p>The area is dominated by gently undulating topography with isolated lateritic breakaways preserved on an intensely developed regolith. It is underlain by Archaean granite/gneiss greenstone terrane metamorphosed to amphibolite/granulite grade. Minor banded iron formation outcrops are known, and aplite-pegmatite dykes intrude the amphibolites at the Burgess Find gold workings.</p> <p>Burges Find, Christmas Gift, Benbur and Easter Gift were the four main areas mined at Burracoppin. (See Figure 2 below) The Burgess Find, Christmas Gift and Benbur mines reported production figures of 410 tonnes, 750 tonnes and 1030 tonnes, respectively. Production of the original miners in the 1930s was reported in the "Daily News" newspaper (June 1933), which wrote that the first parcel processed from Burracoppin had produced gold grades of 49g/t.</p> <p>The workings targeted mineralisation hosted in narrow, vertically dipping veins that occur within a gabbro dyke at or close to its western margin in pelitic sediments. The veins and gabbro strike north south and are folded into a series of open folds. The Easter Gift workings occur in mafic granulite and metasediments and occupy a similar stratigraphic position to that of the Christmas Gift-Benbur North-Benbur workings to the north.</p> <p>Laterites that cover the Archaean rock sequence also carries gold mineralisation. The laterite consists of loose pisolithes with a significant sand matrix component at the surface, grading into a poorly to well cemented nodular laterite layer. Gold mineralisation appears to be restricted to the iron-rich laterites.</p>

Data aggregation methods	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. 	<ul style="list-style-type: none"> No grade aggregation, weighting, or cut-off methods were used for this announcement. 																																																																																																																																																																
Relationship between mineralisation	<ul style="list-style-type: none"> These relationships are particularly important in the reporting of Exploration Results. 	The mineralised units are near vertical and drilling has almost exclusively been conducted from the east at optimal angles with the mineralised units. The drill																																																																																																																																																																

Criteria	JORC Code explanation	Commentary
widths and intercept lengths	<ul style="list-style-type: none"> If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. 	angle is about -50 degrees, resulting in mineralised intersections slightly longer than the true width. Interpretation of the mineralised units honour the true width.
Diagrams	<ul style="list-style-type: none"> Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	

Criteria	JORC Code explanation	Commentary
		 
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of results. 	<ul style="list-style-type: none"> All results of Askari Metals' samples from the RC program have been reported in this release...See appendix 3
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of
