

ASX Release

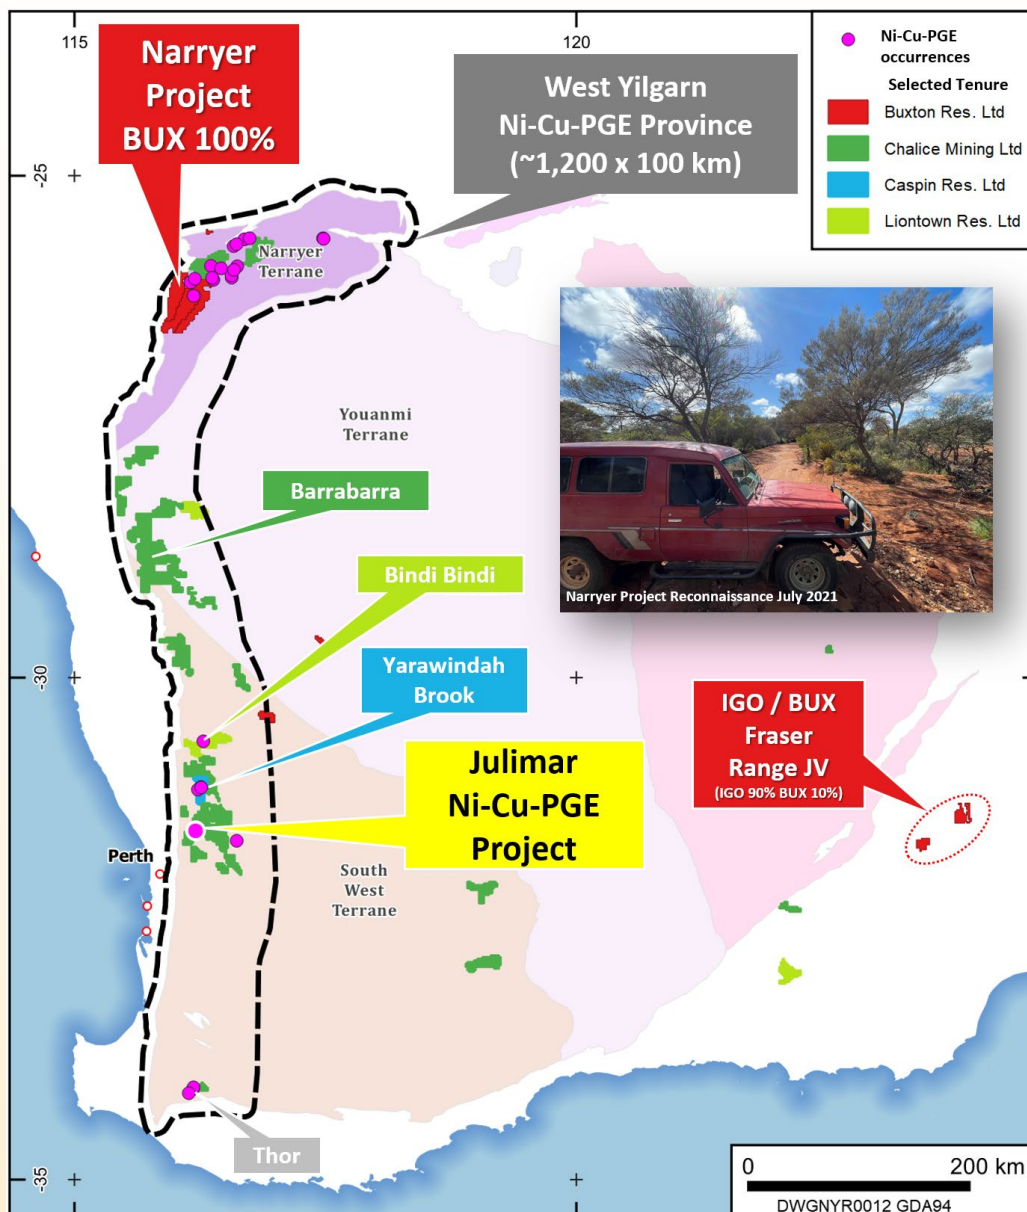

18 October 2021

## Narryer Project - Commencement of Gravity Survey

- Gravity surveying programme commenced
- Results expected within 2 weeks

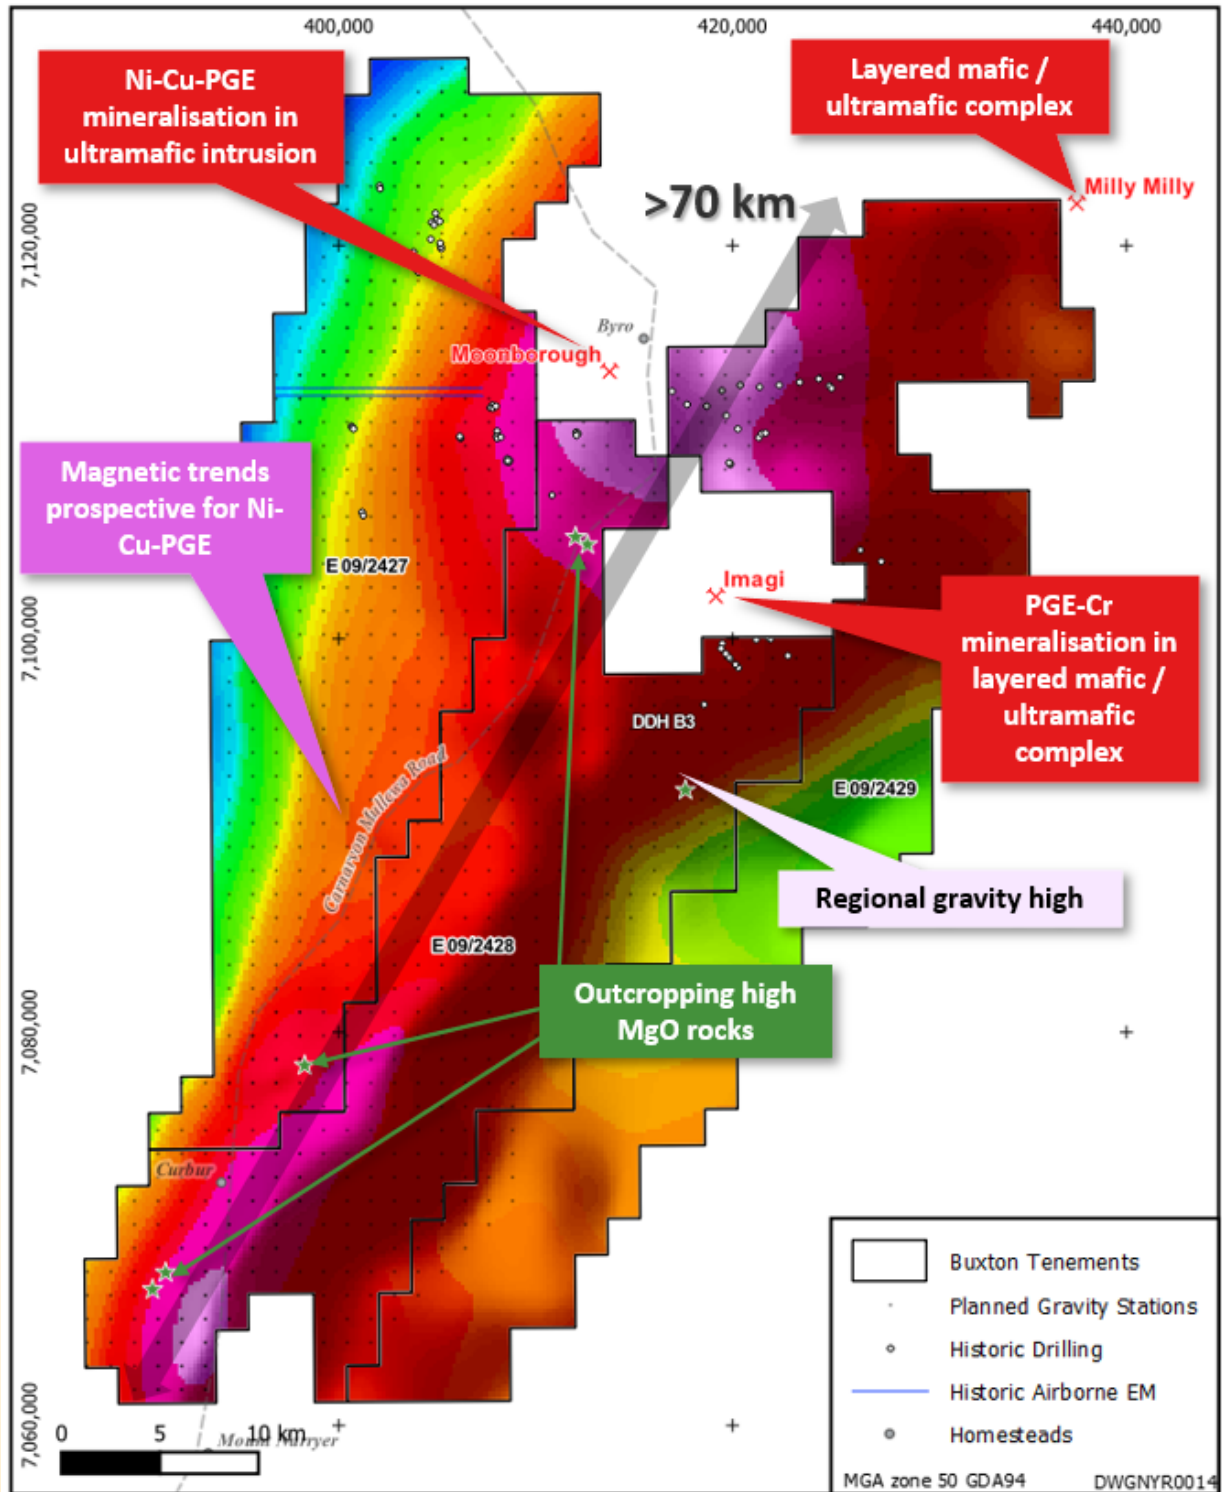

Buxton Resources Limited (ASX:BUX) updates the market that on-ground exploration programs have commenced at the 100% owned Narryer Project in the Narryer Terrane, Western Australia.

The Narryer Terrane forms part of the Western Yilgarn Craton margin which hosts the recently discovered, world-class Julimar Ni-Cu-PGE Project. This new discovery by Challis Mining Ltd and the presence of numerous Ni-Cu-PGE occurrences along a >1,000km strike length defines the West Yilgarn Ni-Cu-PGE Province - a highly prospective new exploration frontier now subject to intense exploration activity, see Figure 1.

**Figure 1:**  
Regional  
setting of  
Buxton's  
100% owned  
Narryer  
Project

Previous gravity coverage in this area is extremely limited with most of the region covered by 5-6 kilometre spaced stations. Buxton's infill gravity program comprises an initial grid of 1,021 stations at 1,200 metre spacing, followed by further infill at 400 metre spacing over selected anomalies.

**Figure 2: Existing open file bouguer gravity image over Buxton's three contiguous 100% owned exploration licenses.**

Buxton will provide ongoing updates on the progress of this exciting project as information comes to hand.

This ASX release has been approved for release by Eamon Hannon on behalf of the Board of Directors.

**For further information, please contact:**

**Competent Persons**

*The information in this report that relates to Exploration Results is based on information compiled by Mr Eamon Hannon, Member of the Australasian Institute of Mining and Metallurgy, and Mr Martin Moloney, Member of the Australian Institute of Geoscientists. Mr Hannon and Mr Moloney are full-time employees of Buxton Resources. Mr Hannon and Mr Moloney have sufficient experience which is relevant to the activity being undertaken to qualify as a "Competent Person", as defined in the 2012 edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Hannon and Mr Moloney consent to the inclusion in this report of the matters based on the information in the form and context in which it appears.*

## JORC Table: Section 1 – Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down-hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i>	Reconnaissance rock chip sampling by Buxton was selective, with 0.2 – 1kg of sample collected at each site. The sampling was conducted in order to provide a representative assay of the outcrop being sampled.
	<i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i>	Exploration drilling at the Imagi Well prospect by Electrolytic Zinc Company has been undertaken utilizing wireline diamond core drilling which was used to obtain 0.5m – 1.2m samples based on geological intervals.
	<i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i>	The historical records do not provide enough detail to assess the representivity of this sampling, although historic logs do indicate that the mineralisation is generally disseminated, and that sampling was continuous through the hole, both of which reduce the risk of bias from selective sampling.
Drilling techniques	<i>Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	The 1970 diamond drillhole used a Mindrill A3000 BQ Wireline diamond drill rig
Drill sample recovery	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i>	Electrolytic Zinc Company historical records (reported in WAMEX a828 & a1435) indicate highly variable recoveries from the core section from between 5% - 113%. The highest Ni result was from a 40-foot section of core with 5% recovery. The highest Cu and S result was from a 5-foot section with 55% recovery. A systematic relationship between recovery and grade has not been determined.
	<i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i>	
	<i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	
Logging	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i>	Electrolytic Zinc Company historical records (reported in WAMEX a828 & a1435) provide summary logs.
	<i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i>	
	<i>The total length and percentage of the relevant intersections logged.</i>	
Sub-sampling techniques and sample preparation	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	Electrolytic Zinc Company historical records (reported in WAMEX a828 & a1435) do not describe sampling & preparation techniques.
	<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i>	
	<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	The historical records do not provide detail on the representivity of this sampling, although historic logs do indicate that the mineralisation is generally disseminated, and that sampling was continuous through the hole, both of which reduce the risk of bias from selective sampling.
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	
	<i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i>	
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	
Quality of assay data and laboratory tests	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i>	Not applicable.

	<i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i>	Not applicable.
	<i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i>	Not applicable.
Verification of sampling and assaying	<i>The verification of significant intersections by either independent or alternative company personnel.</i>	Reporting of significant intersections as recorded in the WAMEX open file report repository was reviewed and compiled by senior BUX geological personnel.
	<i>The use of twinned holes.</i>	Not applicable.
	<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i>	Previous Electrolyte Zinc Co logs are reported in WAMEX a828 & a1435
	<i>Discuss any adjustment to assay data.</i>	Results reported as Mg were converted to MgO using a multiplication factor of 1.658
Location of data points	<i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i>	Handheld GPS (+/-5m) was used to locate BUX rock chip samples. Previous drill collars were digitised from historic records as recorded in WAMEX archives with reference to topographical, satellite imagery and known reference points.
	<i>Specification of the grid system used.</i>	MGA50 (GDA94).
	<i>Quality and adequacy of topographic control.</i>	A DEM (digital terrain model) was subset from the SRTM-derived 1 Second Digital Elevation Models Version 1.0 from Geoscience Australia and is deemed sufficient for this stage of exploration. Absolute accuracy of the SRTM data as tested using Permanent Survey Marks across Australia was found to be 7.582 m at the 95th percentile with an RMS error of 3.868 m in open, flat terrain. Ninety-nine percent of points are within a height difference of less than 9.602 m.
Data spacing and distribution	<i>Data spacing for reporting of Exploration Results.</i>	No Mineral Resource or Ore Reserve calculations have been performed.  No sample compositing is reported.
	<i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i>	
	<i>Whether sample compositing has been applied.</i>	
Orientation of data in relation to geological structure	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i>	The current drill spacing does not allow for the relationship between drill orientation and mineralisation to be known with certainty and the possibility of bias in relation to orientation of geological structure is currently unknown.  All mineralized intervals are down hole intervals, not true width.
	<i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	
Sample security	<i>The measures taken to ensure sample security.</i>	The chain-of-sample custody is managed by the BUX staff.  Samples were stored at Curbur and Byro field camp and sampled in the field by BUX staff and contractors.  Samples were placed in pre-numbered calico bags and further secured in green plastic sample bags with cable

		<p>ties. The samples are further secured in a bulk bag and delivered to the laboratory by freight contractor.</p> <p>A sample reconciliation advice is sent by the laboratory to BUX on receipt of the samples.</p> <p>Sample preparation and analysis is completed at the one analytical laboratory (ALS).</p> <p>The risk of deliberate or accidental loss or contamination of samples is considered very low</p>
<i>Audits or reviews</i>	<i>The results of any audits or reviews of sampling techniques and data.</i>	No specific external audits or reviews have been undertaken.

## JORC Table: Section 2 – Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i>	BUX have a 100% interest in E09/2427, 2428 & 2429. No material issues with land access are known at this stage.
	<i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	The tenement is in good standing with DMIRS and there are no known impediments for exploration on this tenement.
<i>Exploration done by other parties</i>	<i>Acknowledgment and appraisal of exploration by other parties.</i>	Numerous exploration parties have held portions of the area covered by BUX tenure previously. Buxton has undertaken a detailed review of 140 previous exploration reports as held in the DMIRS WAMEX system, along with a compilation of other relevant open file data.
<i>Geology</i>	<i>Deposit type, geological setting and style of mineralisation.</i>	Known mineralisation in the Project area is interpreted to be primary ortho magmatic intrusion related Ni-Cu-Co-PGE sulphide type.
<i>Drill hole Information</i>	<i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i>	See text and figures in body of release.
	<i>o easting and northing of the drill hole collar</i>	
	<i>o elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i>	
	<i>o dip and azimuth of the hole</i>	
	<i>o down hole length and interception depth</i>	
	<i>o hole length</i>	
	<i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i>	
<i>Data aggregation methods</i>	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i>	Not applicable.

	<p>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</p> <p>The assumptions used for any reporting of metal equivalent values should be clearly stated.</p>	
Relationship between mineralisation widths and intercept lengths	<p>These relationships are particularly important in the reporting of Exploration Results.</p> <p>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</p> <p>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</p>	The limited historical drill database does not allow for the relationship between mineralisation widths and intercept lengths to be known with certainty and the possibility of bias in relation to orientation of geological structure is currently unknown.
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	See text and figures in body of release.
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	<p>Reporting of BUX's rock chip sampling is limited to high MgO occurrences, and sampling which has returned low MgO is not reported.</p> <p>A selection of relevant historical exploration results are reported herein, including the location of all drillholes known at this time, and the location of all airborne EM flight lines that intersect the part of the package which is interpreted to be prospective.</p> <p>At the scale of the reported results this is not deemed to misrepresent the indicated prospectivity of the tenement package.</p>
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	Not applicable.
Further work	<p>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</p> <p>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>	<p>See text and figures in body of release.</p> <p>See figures in body of release.</p>
