ASX RELEASE

26 October 2021

Sulphide Mineralising System Extended at Phil's Hill

The Company's principal business objectives are the acquisition, exploration, development and operation of PGE, copper, nickel silver, gold, vanadium and other mineral deposits.

Directors
Peter Wall (Chairman)
Mark Freeman (MD)
Bob Affleck (Technical Director)

Company Secretary
Mark Freeman

Highlights:

- Sulphide mineralising system extended over **1.6km strike**, ***open north and south*** with **massive, stringer or disseminated sulphides** in all holes
- **Silver mineralisation** up to **6.96 g/**t noted in all four assay batches
- Sulphides from **at least 2 to 4** different mineralising events
- Hole 6 found **massive and stringer sulphides from 54-94m**. Potential Ni sulphides observed at 180m (assays pending)
- Hole 8 found **massive, stringer and disseminated sulphides 49-54m and 137-166m**. Potential Ni sulphides observed at 172m (assays pending)
- Diamond drilling completed with 8 holes drilled for **1,538m**
- DHEM crew on site this week to survey holes 3 to 8

Next Steps:

- Expedite assays holes 3, 6, 7 and 8
- Complete DHEM on all holes
- Plan follow-up auger geochemistry at Phil's Hill to expand coverage along strike N and S
- Initiate geochemical & geophysical surveys at Ablett Prospect

Pursuit Managing Director, Mark Freeman, said:

*"These **assay results are very meaningful** and **give strong encouragement** that the Company has located **a significant mineralising system** at Phil's Hill. Our technical team are now focussed on finding the core of the system and will be working with geophysical and geochemical consultants to that end. The **significant PGE anomalism** in our surface soils remains a strong driver for continued follow-up Geochem. The Company eagerly awaits assay results from holes 3, 6, 7 and 8. The drillers and our exploration team have done a phenomenal job on site with minimal disturbance to the crop and have ensured excellent relationships maintained and strengthened within the community in the district."*

Warrior Project (100%)

Pursuit Minerals Limited (ASX:PUR) ("Pursuit" or the "Company") is pleased to provide assay results for four drill holes from the Phil's Hill prospect diamond drilling program. Drilling has now ceased and in total, eight holes were drilled at Phil's Hill for 1,538 m (Figure 1 & Table 1).

Silver mineralisation up to 6.96 g/t and anomalous gold, copper, and nickel are reported in the assay results for the first four diamond drill holes (1, 2, 4 and 5) (Table 2 & Appendix 1).

In order to understand the implications of silver mineralisation and gold, copper, and nickel anomalism all assay results have been reviewed by consultant geochemist Pathfinder Exploration (Pathfinder). Pathfinder utilised a number of statistical techniques, such as correlation and cluster analysis, to highlight trends and elemental associations in the data. This approach can highlight the likely type of mineralising system the Company has found at Phil's Hill and how best to explore it.

Pathfinder's analysis suggests Phil's Hill could be reflecting several possible mineralisation styles, specifically:

- **Gold – polymetallic mineralisation** – containing Au – Ag - Cu – Mo, as found in gold or gold-copper mineralisation
- **Ultramafic/PGE -** comprises an elemental association of Cr – Mg – Ni – (Pd – Pt)
- **Pegmatite –** porphyritic intrusive association that includes elements such as rare earths.
- **Lead – Zn mineralization –** Pb – Zn – Sb – Cd – Mn /Co, such as is found in Volcanic Hosted Massive Sulphide (VHMS) systems.

Mineralisation located in all drill holes suggests there may have been an **overprinting of at least two mineralising events** at Phil's Hill. Once all assay data are received, the Company will review them with geophysical and geochemical consultants to plan new programs to search for the core of the mineralising system.

Table 1: Collar details for Phil's Hill diamond drill holes

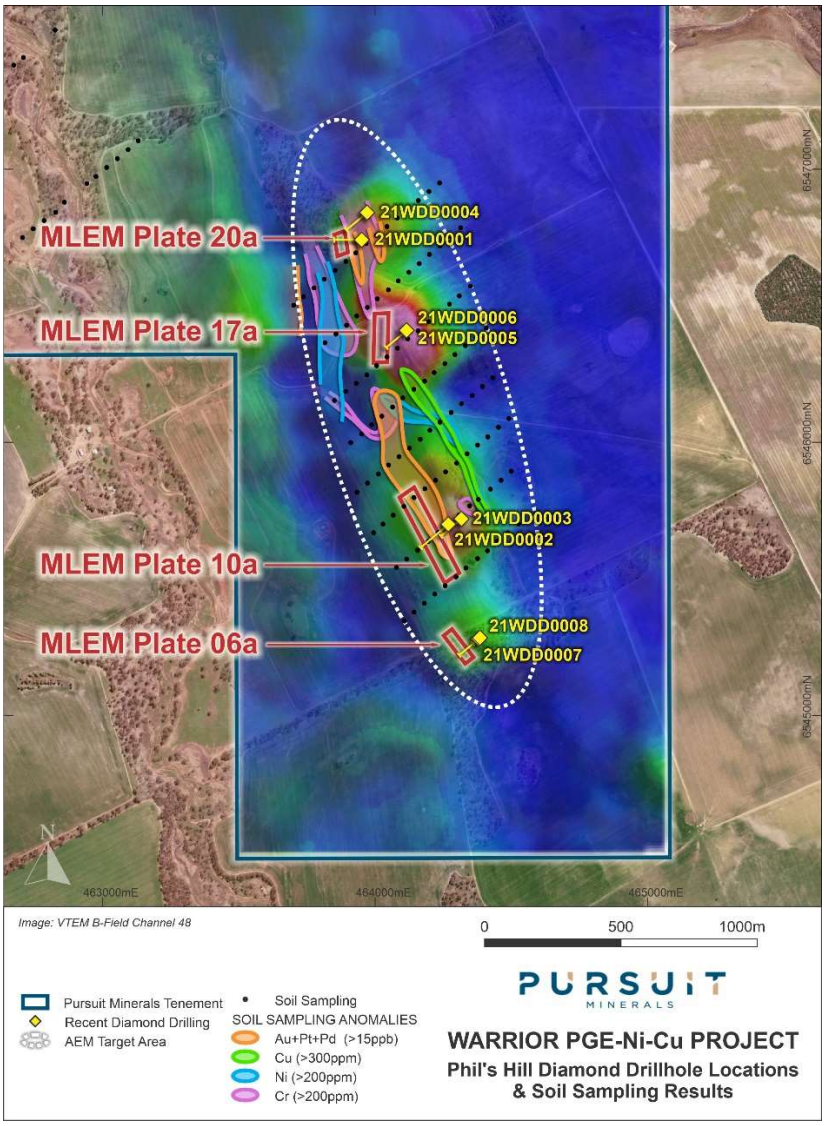

Figure 1 – Phil's Hill Diamond Drill holes and surface geochemistry

Assay Results from Drilling of EM Plate 20a - 21WDD0001 and 21WDD0004 (Holes 1 and 4)

Assay results have been received for drill holes 1 and 4 that were testing conductor Plate 20a previously identified from electromagnetic (EM) surveying. Drill hole 4 previously reported intersecting massive sulphides in the interpreted position of conductive EM Plate 20a. Assay results have been received confirming these sulphides contain silver mineralisation (Figures 2 & 3) and anomalous copper and gold.

Hole 4 mineralised intervals include:

- 0.32m @ **3.96 g/t Ag**, 0.12% Cu from 103.98m, and
- **3.7m** @ **3.19 g/t Ag** from 129.5m.

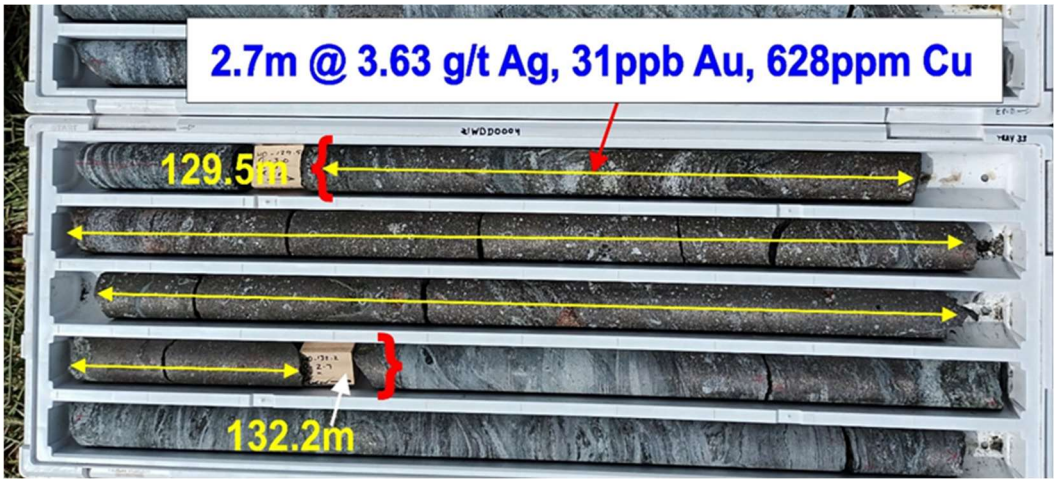

Figure 2: Silver mineralised massive sulphides intersected in 21WDD0004

Significant silver mineralisation is noted in hole 1 nearby with **1.3m @ 3.09 g/t Ag** from 59.7m, including 0.3m @ **5.14 g/t Ag** & 0.13% Cu from 59.7m (Figure 3). The mineralisation intersected in Hole 1 is approximately 72m along strike of the massive sulphides intersected in Hole 4 (Figure 4).

Clear patterns of geochemical anomalism are observed in the assay data (Table 1). This anomalism suggests the mineralisation intersected in Hole 1 may represent 'leakage' of mineralisation along strike and up dip of the massive sulphide zone intersected in hole 4 (Figure 4).

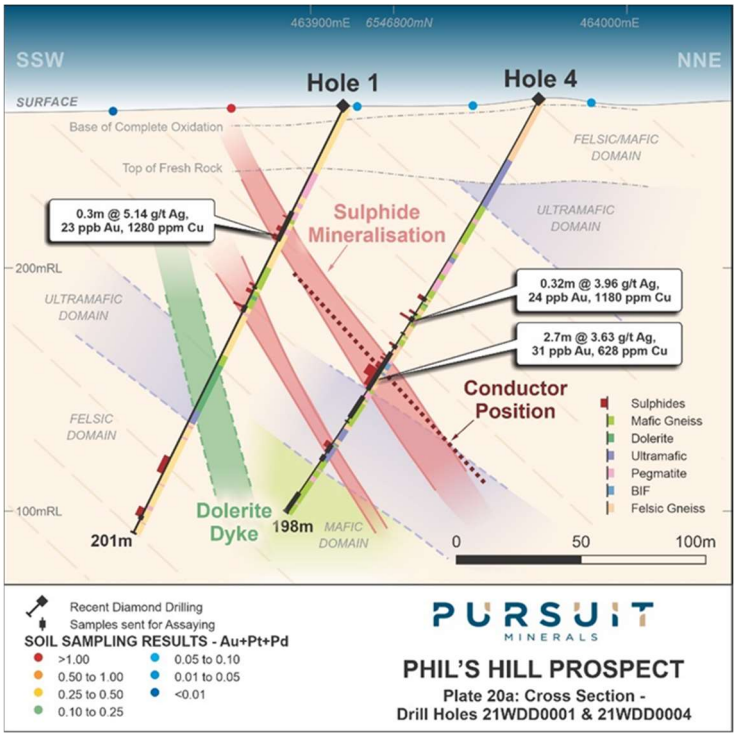

Figure 3: Cross section showing sulphide mineralisation in drill holes testing EM Plate 20a
Note: Both drill holes have been projected onto the same cross section.

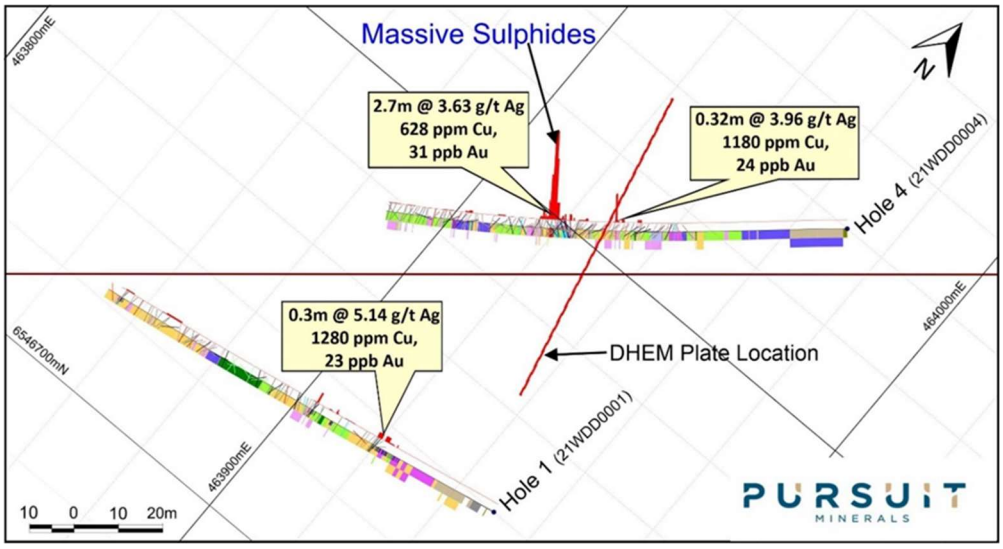

Figure 4: Surface projection of EM Plate 20a, assay results in relation to drill holes

Deeper in hole 4 from 154.5 to 171.5m an anomalous ultramafic elemental association is noted with elevated Pt/Pd to 24ppb (Table 2).

Assay Results from Drilling of Plate 10a - 21WDD0002 / Hole 2

The number and length of sulphide intervals in Hole 2 was quite low given that failed to intersect the EM plate (Figure 5) but clear patterns of geochemical anomalism are observed in the assay data (Table 2). Significant Ag, Cu, Au, Co and Ni is noted at 75m (Figure 5, 6) as well as at 237m. Results for Hole 3 are pending at this time. Significant intervals in Hole 2 include:

- **2m @ 4.40 g/t Ag** from 74.6m, *including*
  - **0.6m @ 6.95 g/t Ag,** 0.03% Cu from 75m (Figure 6)
- 1.4m @ 2.19 g/t Ag from 62.9m
- 1.5m @ 1.91 g/t Ag from 69.2m
- **1.15m @ 3.45 g/t Ag** from 236m, *including*
  - 0.15m @ **5.02 g/t Ag, 0.41% Cu, 51 ppb Au** from 237m

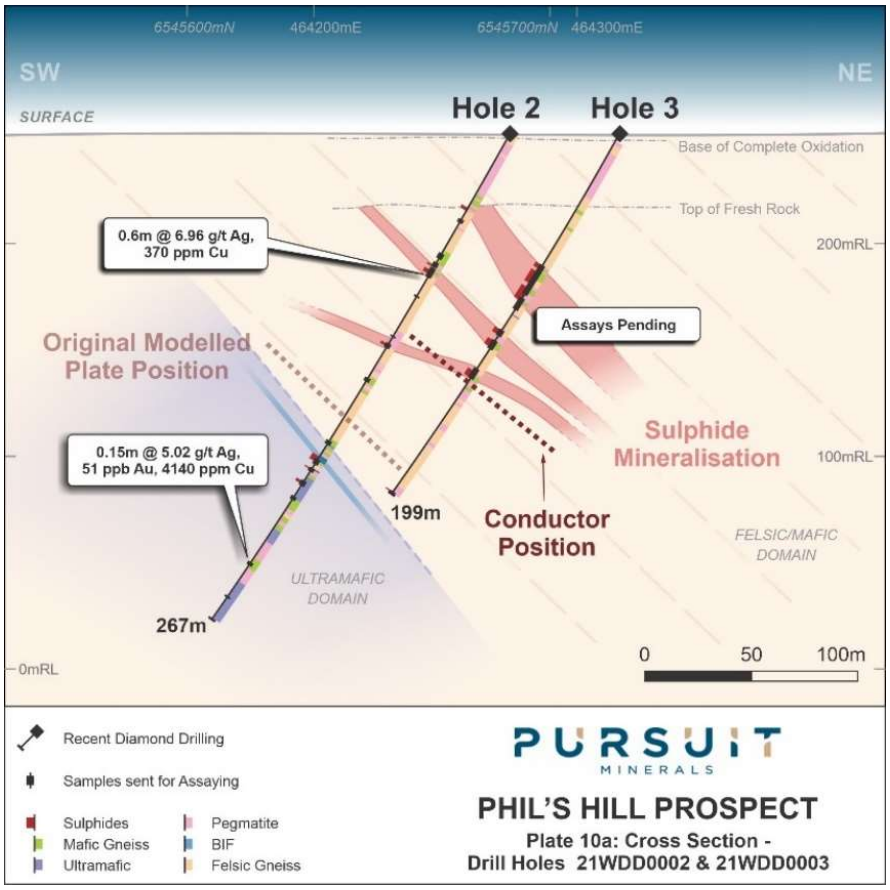

Figure 5: Plate 10a Cross section showing sulphide mineralisation and assay anomalism Holes 2 and 3

Table 2: Anomalous Ag intervals holes 1, 2, 4 and 5, Phil's Hill – note all intervals are down-hole intervals, not true thicknesses

Assay Results From Drilling of Plate 17a - Hole 5 (21WDD0005), Logging Hole 6

Hole 5 was abandoned at 71.4m following drilling problems and Hole 6 was a re-drill 3m to the SW (Figure 6). Only selected zones in Hole 5 were sampled but significant Ag, As, Pt, Pd, Cr and Ni anomalism is noted high in the hole. Significant results include:

- **1.5m @ 4.59 g/t Ag** from 0.5m
- 7.8m @ 1.30 g/t Ag from 62.9m

Arsenic anomalism is not noted at Plates 10a and 20a and this new presence is very supportive of a gold-polymetallic mineralisation association. Assay results for Hole 6 are pending.

Logging of Hole 6 located massive and stringer sulphides from 54.5 to 94.4m associated with altered pegmatites and mafic units in contact with the pegmatite. Magmatic sulphides were also observed at 180m within pyroxenites toward the base of the unit. Any massive sulphide close to this interval (off-hole) would have been effectively masked and this could explain the fact that a conductor was not seen on this section.

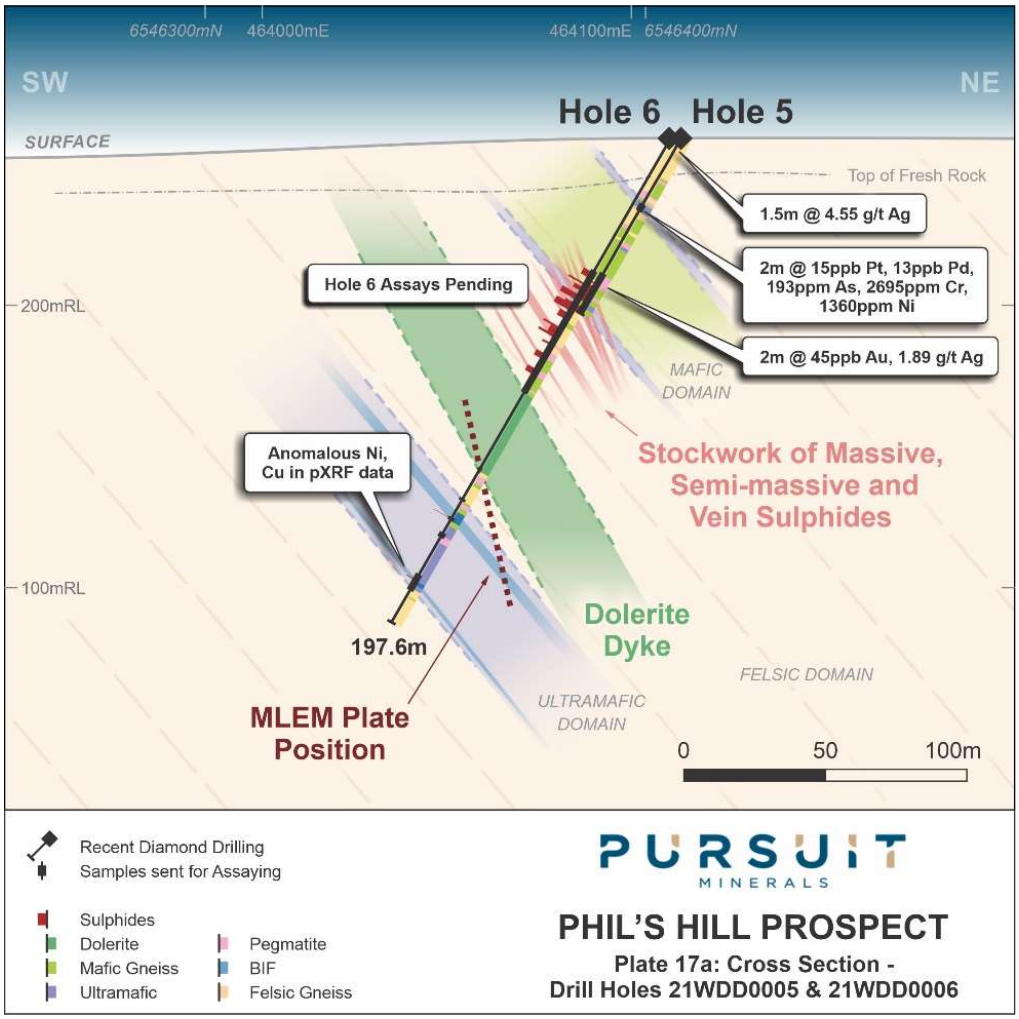

Figure 6: Plate 17a Cross section showing sulphide mineralisation and assay anomalism, Hole 5

Plate 6a – Logging of Holes 7 and 8 (21WDD0007 and 21WDD0008)

Two holes were drilled at the southern plate 6a (Figure 1), holes 7 and 8. Hole 7 ended at 59.5m due to drilling problems and hole 8 was a redrill 5m to the NE. Assay results are pending for Holes 7 and 8.

Logging of Hole 8 found massive, stringer and disseminated sulphides from 49-54m and 137-166m with apparent magmatic Ni sulphides over 0.8m at 172m downhole. The core is quite different from previous holes with increased silicification and potassic alteration observed, which is common in Au-Cu mineral systems. Biotite alteration is more intense and the core more broken indicating intense alteration and fracturing which assists creating space for subsequent mineralising fluids.

A detailed analysis of past drillhole geochemistry at Warrior by geochemical consultant GC Xplore has highlighted a number of anomalies and trends that warrant follow up once crops are harvested at the project area next January.

Competent Person's Statement

Statements contained in this announcement relating to exploration results, are based on, and fairly represents, information and supporting documentation prepared by Mr. Mathew Perrot, who is a Registered Practicing Geologist Member No 10167 and a member of the Australian Institute of Geoscientists, Member No 2804. Mr. Perrot is a full-time employee the Company, as the Company's Exploration Manager and has sufficient relevant experience in relation to the mineralisation style being reported on to qualify as a Competent Person for reporting exploration results, as defined in the Australian Code for Reporting of Identified Mineral Resources and Ore Reserves (JORC) Code 2012. Mr Perrot consents to the use of this information in this announcement in the form and context in which it appears and holds shares in the company.

Forward looking statements

Statements relating to the estimated or expected future production, operating results, cash flows and costs and financial condition of Pursuit Minerals Limited's planned work at the Company's projects and the expected results of such work are forward-looking statements. Forward-looking statements are statements that are not historical facts and are generally, but not always, identified by words such as the following: expects, plans, anticipates, forecasts, believes, intends, estimates, projects, assumes, potential and similar expressions. Forward-looking statements also include reference to events or conditions that will, would, may, could or should occur. Information concerning exploration results and mineral reserve and resource estimates may also be deemed to be forward-looking statements, as it constitutes a prediction of what might be found to be present when and if a project is actually developed.

These forward-looking statements are necessarily based upon a number of estimates and assumptions that, while considered reasonable at the time they are made, are inherently subject to a variety of risks and uncertainties which could cause actual events or results to differ materially from those reflected in the forward-looking statements, including, without limitation: uncertainties related to raising sufficient financing to fund the planned work in a timely manner and on acceptable terms;

changes in planned work resulting from logistical, technical or other factors; the possibility that results of work will not fulfil projections/expectations and realize the perceived potential of the Company's projects; uncertainties involved in the interpretation of drilling results and other tests and the estimation of gold reserves and resources; risk of accidents, equipment breakdowns and labour disputes or other unanticipated difficulties or interruptions; the possibility of environmental issues at the Company's projects; the possibility of cost overruns or unanticipated expenses in work programs; the need to obtain permits and comply with environmental laws and regulations and other government requirements; fluctuations in the price of gold and other risks and uncertainties.

GLOSSARY

Ag	*Silver*
Au	*Gold*
Cu	*Copper*
DHEM	*Down Hole Electro-Magnetic surveying*
Disseminated sulphides	*Sulphides throughout the rock mass – not joined together and not conductive*
Epigenetic	*Mineralisation forming after rocks were formed by later mineralising events*
g/t	*Grams per ton*
Intrusive	*Body of igneous rock that has crystallized from molten magma below the surface of the Earth*
Litho-geochemistry	*Study of common elemental signatures in different rock types to aid accurate logging by geologists*
Metamorphism	*The solid state recrystallisation of pre-existing rocks due to changes in heat and/or pressure and/or the introduction of fluids, i.e. without melting*
Massive Sulphides	*The majority of the rock mass consists of various sulphide species*
Ni	*Nickel*
ppm	*Parts per million*
Pegmatite	*Exceptionally coarse-grained granitic intrusive rock,*
polymetallic mineralisation	*Deposits which contain different elements in economic concentrations*
Pb	*lead*
Pyroxenite	*A coarse-grained, igneous rock consisting mainly of pyroxenes. It may contain biotite, hornblende, or olivine as accessories.*
Sulphides	*Various chemical compounds of sulphur and metals*
Ultramafic	*Very low silica content igneous and metamorphic rocks*
Zn	*Zinc*
VHMS	*Volcanic Hosted Massive Sulphide*

PURSUIT MINERALS

APPENDIX 1 – ASSAY RESULTS, DIAMOND HOLES 1, 2, 4 AND 5 – PHIL'S HILL PROSPECT

All interval widths are down hole intervals, not true widths.

1. JORC CODE, 2012 EDITION – TABLE 1 REPORT TEMPLATE

1.1 Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.*	• Diamond drilling is carried out to produce HQ and NQ core • Sampling over selected intervals as determined by the geologist and cut using a core saw with half the material submitted to the laboratory and half retained for further study. In cases where duplicate samples are required the half-core sample is cut into quarter-core and submitted for assay • Samples are bagged into numbered calico sacks and these are placed into plastic bags, sealed and labelled for transport

Criteria	JORC Code explanation	Commentary
Drilling techniques	• *Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Diamond drilling was undertaken by a Mount Magnet Drilling using a D800 drill rig. • Drilling started from surface using HQ core until competent ground was reached where drilling changed to NQ.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Drill core was oriented, metre marked and geotechnically logged including recoveries • Recoveries were lower in the weathered zones of the holes and improved to 100% once competent ground was encountered • It is unclear if there is any relationship exists between lost material and grade
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Logging has followed company standards and is qualitative in nature. The level of logging is appropriate for exploration and initial resource evaluation. • All core is photographed after all geological and geotechnical logging is completed and the holes marked up for sampling. • The entire hole is logged as per company procedures.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and*	• After logging and selection of sample intervals by the geologist, the marked core is cut in half using a diamond saw. • Half core sampling is regarded as appropriate sampling technique although duplicate samples are quarter cored. Samples are selected for analysis based on geological logging and supported by pXRF readings taken on the

Criteria	JORC Code explanation	Commentary
	appropriateness of the sample preparation technique. • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	core by the geologist. • Experienced samplers are utilised to ensure samples were restricted to the interval with all material to be sent to the laboratory being collected and all retained material being replaced into trays • Known standards and field duplicates have been collected to ensure the accuracy of the laboratory • Sufficient material has been collected for the relatively fine-grained gneiss sampled
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.*	• Samples were submitted to ALS Laboratories in Perth WA. Samples were crushed and pulverised to 85% passing <75um. Samples were analysed for Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Mo, Na,Nb, Ni, P, Pb, Rb, Re, S, Sb, Sc, Se, Sn, Sr, Ta,Te, Th, Ti, Tl, U, V, W, Y, Zn, Zr, Dy, Er, Eu, Gd, Ho, Lu, Nd, Pr, Sm, Tb, Tm, Yb, with four acid digest ME-MS61 with gold analysed by fire assay Au-ICP21 (fire assay 30g). Results are considered to be near total. • pXRF results are collected using a Vanta VMR handheld unit manufactured by Olympus. The unit operates in Geochem mode and captures 3 beams of data, initial test work with known standards have indicated that 30 seconds per beam produces consistent results with the standards and has been set for all readings taken onsite. • QAQC protocols are in place that insert industry prepared standards from OREAS into assay batches that are matrix matched and includes low, medium and high-level known values for Ci, Ni and precious metals. Blanks and field duplicates (quarter core) are also inserted into the sample string. • All batches, assay or pXRF have a QAQC report prepared and sent to the

Criteria	JORC Code explanation	Commentary
		logging geologist to confirm that the results are within acceptable parameters before the batch is loaded into the database. • The standards being used indicate that the batches received to date are within tolerances and the results are appropriate for exploration and initial resource estimation evaluation
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The results are loaded and verified by the companies database administrator before being reviewed and validated by the Companies Competent Person. • No twinned holes have been drilled • Data is collected directly onto computers or tablets in the field before being sent to the database administrator for loading. The database administrator uses validation protocols to ensure that the data loaded is correct. • No corrections or adjustments have been made to assay data
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Drill holes were located using a hand-held GPS with accuracy of ~4m • Data location is recorded in WGS84-UTM Zone 50 south. • Topographic control from DEM prepared by geophysical consultants
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.*	• Drilling is not located on any particular grid at this time and is designed to test the centre of geophysical anomalies • There is insufficient drilling to utilise for a mineral resource at this point in time • No sample compositing has been undertaken

Criteria	JORC Code explanation	Commentary
	• *Whether sample compositing has been applied.*	
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Drilling is oriented perpendicular to modelled EM plate targets • Insufficient information available to determine if there is a relationship between drilling orientation and mineralisation
Sample security	• *The measures taken to ensure sample security.*	• Samples were taken from site directly to the laboratory by an employee of Pursuit Minerals
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• An audit of assay data has been undertaken by two geochemical consultants

1.2 Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Drilling is on E 70/5379 which is held by Pursuit Exploration Pty Ltd a 100% subsidiary of Pursuit Minerals and is in good standing

Criteria	JORC Code explanation	Commentary
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• June, 1997, Kevron completed a MAG/RAD/DEM survey for Stockdale Prospecting Ltd. The survey was acquired with line spacing of 250 m, line orientation of 000/180° and a mean terrain clearance of 60 m. (MAGIX ID - 1164) • June 2003, UTS Geophysics completed a MAG/RAD/DEM survey for Geoscience Australia. The survey was acquired with line spacing of 400 m, line orientation of 000/180° and a mean terrain clearance of 60 m. • November, 2010, Fugro Airborne Surveys completed a MAG/RAD/DEM survey for Brendon Bradley. The survey was acquired with line spacing of 50 m, line orientation of 090/270° and a mean terrain clearance of 35 m. (MAGIX ID - 3288) • Dominion Mining Limited undertook auger sampling on the project in 2010. The results of this work are summarised in the ASX announcement. Further details can be obtained by accessing WAMEX Report a86032 at: https://geoview.dmp.wa.gov.au/geoview/?Viewer=GeoVIEW&layerTheme • Kingsgate Consolidated Limited undertook aircore drilling within the area of Calingiri East Tenement Application in 2011. The results of this work are summarised in the ASX announcement. Further details can be obtained by accessing WAMEX Report a89716 at: https://geoview.dmp.wa.gov.au/geoview/?Viewer=GeoVIEW&layerTheme= • Poseidon N.L. undertook auger soil sampling and rock chip sampling within the area of Bindi Bindi Tenement Application in 1968. The results of this work are summarised in the ASX announcement.

Criteria	JORC Code explanation	Commentary
		Further details can be obtained by accessing WAMEX Report a7292 at: https://geoview.dmp.wa.gov.au/geoview/?Viewer=GeoVIEW&layerTheme • Washington Resources Limited undertook rock chip sampling within the area of Bindi Bindi Tenement Application in 2008. The results of this work are summarised in the ASX announcement. Further details can be obtained by accessing WAMEX Report a82005 at: https://geoview.dmp.wa.gov.au/geoview/?Viewer=GeoVIEW&layerTheme • Magnetic Resources Limited undertook aircore and RC drilling within the area of Wubin Exploration Licence in 2010. The results of this work are summarised in the ASX announcement. Further details can be obtained by accessing WAMEX Reports a91440 and a84500 at: https://geoview.dmp.wa.gov.au/geoview/?Viewer=GeoVIEW&layerTheme
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The western margin of the Archean Yilgarn Craton is highly prospective for Platinum Group Elements ("PGE") and Nickel (Ni) – Copper (Cu) mineralisation associated with intrusive mafic to ultramafic rocks. The discovery of PGE-Ni-Cu mineralisation at the Julimar Project held by Chalice Gold Mines Limited (see Chalice Gold Mines ASX Announcement 23 March 2020), is the first significant PGE-Ni-Cu discovery in the region which previously only had early-stage indications of mineralisation (Yarawindah, Bindi-Bindi). Increasingly it is becoming apparent that prospective ultramafic-mafic intrusions are far more widespread than previously thought throughout the western margin of the Yilgarn Craton. The project area is located within the

Criteria	JORC Code explanation	Commentary
		>3Ga age Western Gneiss Terrane of the Archean Yilgarn Block, which comprises a strongly deformed belt of gneisses, schists, quartzites, Banded Iron Formation, intruded by mafic to ultramafic rocks. The terrane is up to 70km wide, and possibly wider, and is bounded to the west of the Darling Fault and younger Archean rocks to the east. The general geological strike in northwest. The bedrock Archean metasedimentary gneisses, migmatites and intrusive mafic and ultramafic rocks occur in structurally complex settings. Dolerite dykes of Proterozoic age are widespread. Outcrops are rare and the basement geology is largely obscured by lateritic ironstones and deep saprolitic weathering.

Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:*
	  ○ *easting and northing of the drill hole collar*
	  ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar*
	  ○ *dip and azimuth of the hole*
	  ○ *down hole length and interception depth*
	  ○ *hole length.*
	• *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*
		• A table of drill hole locations has been previously reported
		• All assay results are reported in Appendix 1 of this release

Criteria	JORC Code explanation	Commentary
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• All assay results are reported in Appendix 1 of this release • Sample intervals have been chosen on the basis of geological domains and intervals vary from 0.1m to 1.0m • No metal equivalents are quoted • Intervals reported are calculated as length weighted averages using a cut off of 1.5 g/t Ag with internal dilution of up to 1m of below 1.5 g/t Ag
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').*	• Only downhole widths are reported at this early stage of exploration • True widths of mineralisation are not known at this stage
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Refer to figures in the body of text.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid*	• All assay results are reported in Appendix 1 of this release

Criteria	JORC Code explanation	Commentary
	misleading reporting of Exploration Results.	
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• All exploration data at the prospect has previously been reported
Further work	• *The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Additional drillholes are planned with DHEM follow up of holes drilled to date to ensure conductive bodies have not been missed • Consultant geochemists, petrologists and structural geologists will be engaged to review mineralised zones identified by the company
