NEW FEEDER FAULT MINERALISATION AND NEW MINERALISED ZONE AT NAVAJOH

NEW FEEDER FAULT ZONE*

- Interpreted high-grade feeder fault mineralisation intersected below the recently discovered flat-lying, extensive (4.1km long x 1.9km wide) Chinook zinc-lead mineralisation.
 - Currently defined by 3 holes over 1.7km strike length
 - New drill results include:
 - 10m @ 6.57% Zn + Pb, 16.24 g/t Ag from 200m, within broad zone of 84m @ 1.84% Zn+Pb to end of hole.
 - o 17m @ 3.08% Zn+Pb
 - o 6m @ 6.57% Zn+Pb
 - Metal zonation (Cu-Co-As-Ag), mineral alteration and geological architecture supports potential for deeper large-scale Cu-Zn-Pb-Ag deposits below the extensive, flat-lying, unconformity style mineralisation discovered to date, at Chinook, Tonka and Navajoh.

NEW CHINOOK RESULTS*

- Ongoing RC drilling at the western end of Chinook returned further encouraging infill results, including:
 - 8m @ 3.67% Zn + Pb, 4.10 g/t Ag from 74m (EHRC297)
 - 8m @ 3.65% Zn + Pb, 8.03 g/t Ag from 128m (EHRC197)
 - 17m @ 2.91% Zn + Pb, 2.29 g/t Ag from 110m (EHRC206)
 - 5m @ 4.54% Zn + Pb, 4.24 g/t Ag from 110m (EHRC113)
 - 6m @ 3.48% Zn + Pb, 37.00 g/t Ag from 59m (EHRC159)
 - 5m @ 5.53% Zn + Pb, 3.56 g/t Ag from 79m (EHRC159)

NEW MINERALISED ZONE DEFINED AT NAVAJOH*

- New mineralised zone discovered at Navajoh, located 4km southeast of the recent Tonka Discovery (ASX Release 13-Dec-21).
- First pass drilling on a single traverse intersected significant flat lying Zn-Pb-Ag sulphide mineralisation, like that at the Chinook and Tonka Prospects. New drilling results include:
 - 5m @ 6.38% Zn + Pb, 6.3 g/t Ag from 123m (EHRC280)
 - 3m @ 6.15% Zn + Pb, 10.63 g/t Ag from 132m (EHRC281A)
 - 4m @ 4.18% Zn + Pb, 3.57 g/t Ag from 106m (EHRC291)
 - 9m @ 2.75% Zn + Pb, 2.71 g/t Ag from 157m (EHRC285)

2021 PROGRAM SUMMARY*

The ongoing drilling program has now been expanded to over 50,000m, primarily to further drill and scope the Tonka discovery zone. The drilling is nearing completion for the 2021 season, with this announcement reporting on the results of ninety (90) holes for 13,959 metres. Assay results returned for 28,144m of

drilling (approximately 56% of the planned drilling). The final sets of drilling results are expected by February-March next year.

2022 PLANNED PROGRAM SUMMARY*

Diamond core drilling

- Further testing of the major 1.7km long feeder fault zone intersected at Chinook
- Confirm structural information regarding inferred feeder faults
- Provide further support for the interpretation of large-scale metal zonation within the Project area.
- Collect material for sighter metallurgical test-work

RC Drilling - Further scoping of Chinook, Tonka, Magazine and Navajoh to define the limits of mineralisation and infill within the discovery areas - E69/3464

Sonic drilling

- Superior recoveries recorded in Sonic holes EHS001 and EHS002 compared to diamond drilling within the Navajoh Unconformity Unit (NUU) has supported the Company's decision to restart the Sonic program in 2022. This material will be utilised in further metallurgical test work.
- Sonic drilling will also be used to test all areas of oxide mineralisation.

Metallurgy - Initial sighter test work has commenced

*Refer to Appended - Rumble Resources Limited ASX Release for details

Commenting on the new Earaheedy drilling results, CEO Michael Clifford said: "This last announcement for the 2021 season, of the discovery of two new major zones of zinc-lead mineralisation, caps off a highly significant period in the history of the Earaheedy project. The Earaheedy joint venture has successfully discovered four major new zones of zinc-lead mineralisation during the year. The sheer scale of the mineralised system, as it currently stands at Earaheedy, is hard to comprehend, stretching some 12km in length and up to 1.9km down-dip. Although much work is ahead of us, we are very excited as to what the 2022 exploration program will deliver.

We wish to take this opportunity to thank the Rumble Resources team for their aggressive, yet technically considered approach to the 2021 exploration program. We look forward to receiving the last ~44% of assay results from the 2021 program and seeing the drill rigs running again in 2022."

ZENITH

Zenith Minerals Limited controls 100km of Zn-Pb prospective host rock sequences in the Earaheedy Basin through 100% owned exploration licence applications (Figure 1). These 100% owned tenements are in addition to the Earaheedy Joint Venture (Zenith 25% free carried interest to end of a bankable feasibility study, Rumble Resources Limited - operator).

Competent Persons Statement

The information in this report that relates to Exploration Results and Mineral Resources is based on information compiled by Mr Michael Clifford, who is a Member of the Australian Institute of Geoscientists and an employee of Zenith Minerals Limited. Mr Clifford has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Clifford consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Material ASX Releases Previously Released

The Company has released all material information that relates to Exploration Results, Mineral Resources and Reserves, Economic Studies and Production for the Company's Projects on a continuous basis to the ASX and in compliance with JORC 2012. The Company confirms that it is not aware of any new information that materially affects the content of this ASX release and that the material assumptions and technical parameters remain unchanged.

Zenith Minerals Limited (ASX:ZNC)

Zenith has a vision to build a gold and base metals business with a team of proven project finders. Focus is on 100% owned Zenith projects, whilst partners progress multiple additional opportunities using third party funds.

Zenith is continuing to focus on its core Australian gold and copper projects including:

Western 25% free carry to BFS **Earaheedy** Zinc **Australia**

New major zinc discovery to be fast tracked with extensive accelerated exploration program underpinned by a recent \$40M capital raising by partner Rumble Resources Limited (ASX:RTR) (ASX Releases 28-Apr-21, 2-Jun-21, 8-Jun-21, 18-Oct-21, 13-Dec-21).

ASX ANNOUNCEMENT

Major Zinc-Lead-Silver-Copper Feeder Fault Zone Intersected

Chinook Zn-Pb-Ag-Mn-Cu Prospect

- The top of a large-scale sub-vertical feeder fault zone intersected in drill-hole EHRC136 has returned a broad zone of mineralisation (84m @ 1.84% Zn + Pb from 151m mineralised section) with multiple intersections. Results are:
 - 37m @ 3.25% Zn + Pb, 7.18 g/t Ag from 196m including
 - o 10m @ 6.57% Zn + Pb, 16.24 g/t Ag from 200m
 - Includes 1m @ 17.1% Zn + Pb, 20.9 g/t Ag from 202m
 - o 16m @ 2.54% Zn + Pb, 4.80 g/t Ag from 214m
 - o and 1m @ 5.08% Zn + Pb, 10.4 g/t Ag at end of hole (234-235m)
- Within this broad zone of Zn-Pb mineralisation, significant copper and silver returned:
 - o 4m @ 1.54% Cu with 6.10% Zn + Pb and 23.60 g/t Ag from 204m
- The discovery of significant copper and silver in a northwest trending 1.7km long feeder fault zone at Chinook supports the interpretation of metal zonation within the Earaheedy Project area, with copper reflecting the "hotter" portion of the system
- The potential for deeper large-scale Cu-Zn-Pb-Ag deposits below the extensive unconformity style mineralisation is high, underlining the Earaheedy Project's world class base metal credentials
- Ongoing RC scoping drilling results at Chinook include:
 - 8m @ 3.67% Zn + Pb, 4.10 g/t Ag from 74m (EHRC297)
 - 8m @ 3.65% Zn + Pb, 8.03 g/t Ag from 128m (EHRC197)
 - 17m @ 2.91% Zn + Pb, 2.29 g/t Ag from 110m (EHRC206)
 - 5m @ 4.54% Zn + Pb, 4.24 g/t Ag from 110m (EHRC113)
 - 6m @ 3.48% Zn + Pb, 37.00 g/t Ag from 59m (EHRC159)
 - 5m @ 5.53% Zn + Pb, 3.56 g/t Ag from 79m (EHRC159)
- Chinook's mineralised footprint is 4.1km along strike and 1.9km down dip and remains open in all directions

Navajoh Zn-Pb-Ag Prospect

- Located 4km southeast of the recent Tonka Discovery, first pass drill scoping on a single traverse intersected significant flat lying, northeast dipping unconformity related Zn-Pb-Ag sulphide mineralisation similar to the Chinook and Tonka Prospects. The first round of RC drilling results include:
 - 5m @ 6.38% Zn + Pb, 6.3 g/t Ag from 123m (EHRC280)
 - 3m @ 6.15% Zn + Pb, 10.63 g/t Ag from 132m (EHRC281A)
 - 4m @ 4.18% Zn + Pb, 3.57 g/t Ag from 106m (EHRC291)
 - 9m @ 2.75% Zn + Pb, 2.71 g/t Ag from 157m (EHRC285)

Earaheedy Project - Potential World Class Base Metal System

Since the Chinook discovery in April 2021, scoping drilling has significantly increased the overall metal budget and delineated multiple styles of mineralisation within the small portion of the Earaheedy Project that has been tested. The recent discoveries of Tonka and the Major Feeder Fault Zone at Chinook, encouraging first pass results at the Navajoh Prospect, have once again highlighted the world class potential of this Zn-Pb-Ag-Mn-Cu epigenetic base metal system

Mr Michael Smith
Non-executive Director

Mr Peter Venn Non-executive Director

Mr Steven Wood Company Secretary

Rumble Resources Limited (ASX: RTR) ("Rumble" or "the Company") is pleased to announce that the ongoing scoping drilling at the Earaheedy Project has discovered a major feeder fault zone with very significant zinc-lead-silver mineralisation along with strong copper mineralisation at the Chinook Prospect. Additionally, the first round of drilling at the Navajoh Prospect has delineated significant flat lying unconformity style zinc-lead-silver mineralisation similar to the Chinook and Tonka discoveries.

Rumble Resources' Technical Director Mr Brett Keillor said:

"The discovery of significant copper (>1%) with silver mineralisation at the top of a major feeder fault system along with high grade zinc and lead (**up to 17.1% Zn + Pb** (EHRC136)) at Chinook highlights the potential for a very large-scale zoned base metal system. The copper mineralisation supports the evolving geology and ore deposition model (see image 8) with respect to feeder fault zones reflecting higher depositional temperatures.

"Ultimately, the flat lying regionally extensive unconformity related zinc-lead-silver (manganese) mineralisation that Rumble has delineated at the Chinook, Tonka and now Navajoh Prospects potentially represents the large outer metal halo zone(s) of a world class base metal system that lies within the Earaheedy Project and underlying geological formations."

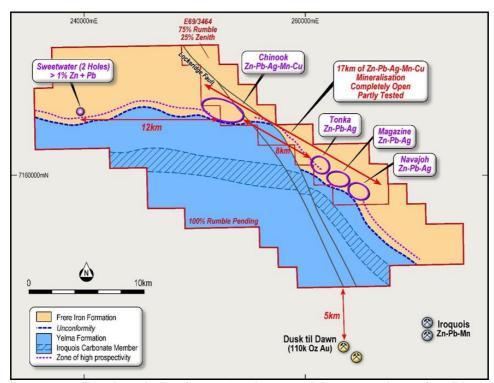

Image 1 - Earaheedy Project - Geology and Prospect Location Plan

Chinook Zn-Pb-Ag-Mn-Cu Prospect – Major Feeder Fault Discovery

Ongoing scoping drilling at Chinook has delineated the top of a large-scale sub-vertical feeder fault close to the Lockeridge Fault System. **EHRC136** intersected a broad zone of mineralisation (**84m @ 1.84% Zn + Pb from 151m – mineralised section**) which returned multiple intersections:

- 37m @ 3.25% Zn + Pb, 7.18 g/t Ag from 196m
 - o inc 10m @ 6.57% Zn + Pb, 16.24 g/t Ag from 200m
 - with 1m @ 17.1% Zn + Pb, 20.9 g/t Ag from 202m; and
 - with 4m @ 1.54% Cu, 6.1% Zn + Pb, 23.6 g/t Ag from 204m
 - o inc 16m @ 2.54% Zn + Pb, 4.80 g/t Ag from 214m
 - inc 1m @ 5.08% Zn + Pb, 10.4 g/t Ag from 234 to End of Hole

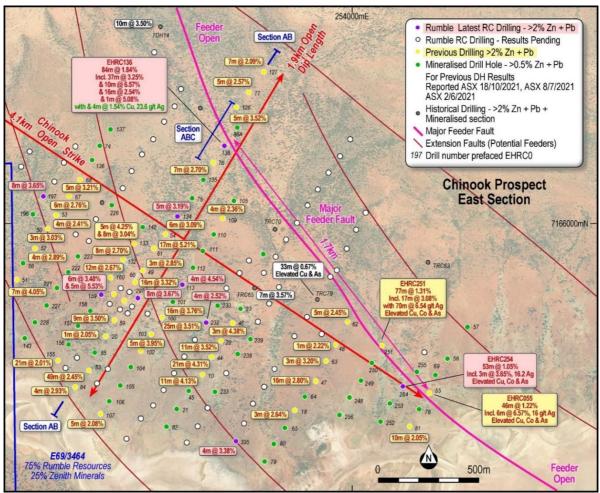

Image 2 - Chinook East Drill Hole Plan - Drill Hole Locations and Intersections

Drill hole EHRC136 is the first hole to intersect <u>highly significant >1% copper</u> in association with zinc, lead and silver mineralisation. **The copper mineralisation is chalcopyrite and chalcocite**. The major feeder fault mineralised zone trends northwest (sub-parallel to the Lockeridge Fault) and has been interpreted to have at least 1.7 km in strike (to date) and is completely open.

At least three (3) previous holes completed by Rumble <u>were near misses</u> as the drill scoping is 100m spaced holes on sections 500m and 200m apart, and include:

- EHRC055 Broad mineralised zone of 72m @ 0.84% Zn + Pb from 24m to EOH (>1000ppm Zn + Pb)
 - o Including 6m @ 6.57% Zn + Pb, 16 g/t Ag from 69m
 - Elevated copper, cobalt and arsenic
- EHRC254 Broad mineralised zone of 53m @ 1.05% Zn + Pb from 27m (>1000ppm Zn + Pb)
 - o Including 3m @ 3.65% Zn + Pb, 16.2 g/t Ag from 45m
 - Elevated copper, cobalt and arsenic
- EHRC251 Broad mineralised zone of 77m @ 1.31% Zn + Pb from 44m (>1000ppm Zn + Pb)
 - o Including 17m @ 3.08% Zn + Pb from 72m
 - With 70m @ 6.54 g/t Ag from 55m
 - Elevated copper, cobalt and arsenic

See image 2 for the location of these holes.

The intersection of the major feeder fault zone and the mineralised unconformity shallows to the southeast along the plane of the feeder zone and likely surfaces underneath the lake system south and southeast of Chinook (see image 2).

Of great importance, the subvertical feeder zone is interpreted to traverse both the underlying Purple Shale (approximately 40 to 70m in thickness) and the Iroquois Carbonate Member (up to 280m in thickness). Both these lithological formations have potential for structurally controlled Cu-Zn-Pb-Ag deposits.

Sections AB and ABC highlight the mineralisation and underlying feeder fault zone (images 3 and 4).

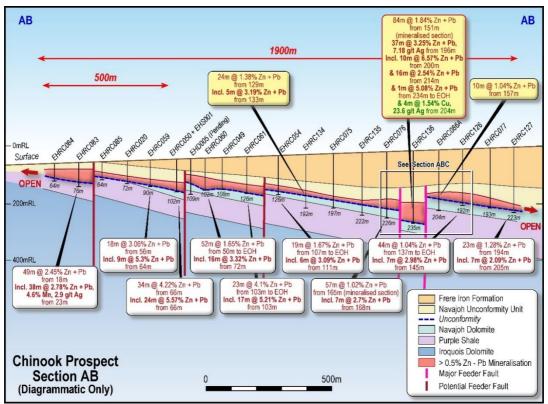

Image 3 – Chinook Prospect – Section AB – Geology and Drill Hole Intersections and interpreted new major Feeder Fault Zone

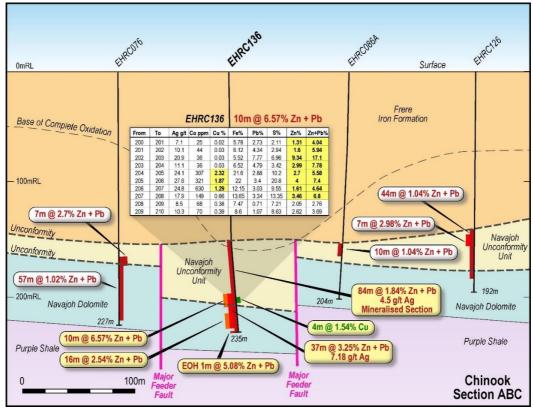

Image 4 - Chinook Prospect - Section ABC - Geology and EHRC136 Assays

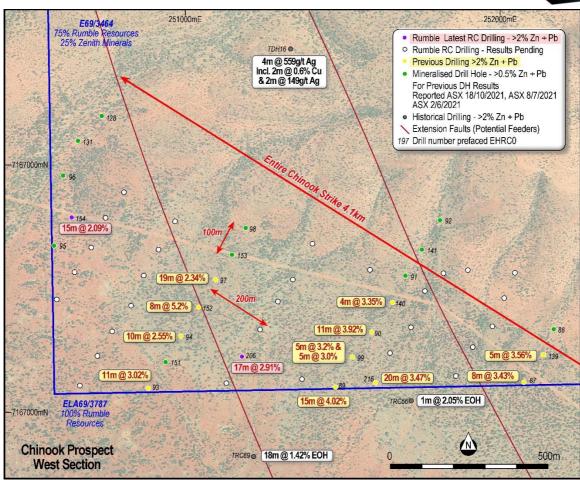

Image 5 - Chinook West Drill Hole Plan - Drill Hole Locations and Intersections

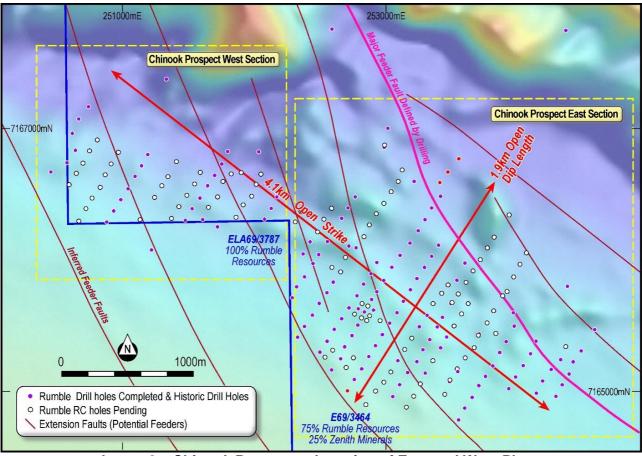

Image 6 - Chinook Prospect - Location of East and West Plans

Chinook Prospect - Ongoing Scoping Drilling - E69/3464

Ongoing RC drilling at Chinook have recently focused on scoping the up-dip position to the northwest and west limits of granted tenement E69/3464 and the down dip position to the southeast end of the mineralised unconformity – See image 2. Latest results include:

- 5m @ 4.54% Zn + Pb, 4.24 g/t Ag from 110m (EHRC113)1
- 6m @ 3.48% Zn + Pb, 37.00 g/t Ag from 59m and 5m @ 5.53% Zn + Pb, 3.56 g/t Ag from 79m (EHRC159)
- 8m @ 3.67% Zn + Pb, 4.10 g/t Ag from 74m (EHRC297)
- 8m @ 3.65% Zn + Pb, 8.03 g/t Ag from 128m (EHRC197)
- 17m @ 2.91% Zn + Pb, 2.29 g/t Ag from 110m (EHRC206)

Upon the grant of Rumble's 100% owned contiguous exploration license ELA 69/3787, drilling is planned northwest and west along strike from E69/3464 towards to the Sweetwater Prospect opening up a further 12kms of strike – see images 1 & 9.

Diamond core drilling has commenced at both Chinook and the recent discovery at Tonka, with the aim of delineating the structural and geological controls of both the flat northeast dipping unconformity related and potential high angle feeder fault zones.

Navajoh Zn-Pb-Ag Prospect

The Navajoh Prospect is located 4kms southeast from the recent Tonka Zn-Pb-Ag Discovery (refer ASX announcement 13 December 2021 - initial footprint of 1.7km strike and 1km down dip length), see image 7.

First pass drill scoping of the Navajoh Zn-Pb-Ag Prospect on a single section intersected significant Zn-Pb-Ag mineralisation of similar style to the flat lying shallow northeast dipping unconformity related Zn-Pb-Ag mineralisation to the Chinook and Tonka discoveries.

Similar to the Chinook and Tonka discoveries, the mineralisation is open in all directions and has the potential to significantly increase its flat lying mineralised dimensions in all directions

The main drill section at Navajoh (approximately 5 drill hole results pending – see image 7) returned significant results including:

- 5m @ 6.38% Zn + Pb, 6.30 g/t Ag from 123m (EHRC280)*
- 3m @ 6.15% Zn + Pb, 10.63 g/t Ag from 132m (EHRC281A)*
- 15m @ 2.09% Zn + Pb, 2.84 g/t Ag from 105m (EHRC291)*
 - o Inc 4m @ 4.18% Zn + Pb, 3.57 g/t Ag from 106m
- 17m @ 2.06% Zn + Pb, 2.07 g/t Ag from 157m (EHRC285)*
 - o Inc 9m @ 2.75% Zn + Pb, 2.71 g/t Ag from 157m

*intersections are True Width

Other Drilling

Between Chinook and Tonka, some 8km of prospective strike has only been partly tested on 500m and 1500m drill section spacings. Significant areas of salt lakes have restricted some access, however, the geology and results received so far indicate the upper Navajoh Unconformity Unit has been partly stripped (eroded) in some areas due to faulting. Results to date reflect generally low grade Zn + Pb mineralisation (see Table 5 for locations and results).

¹ Down hole length intersection – all other intersections are True Width

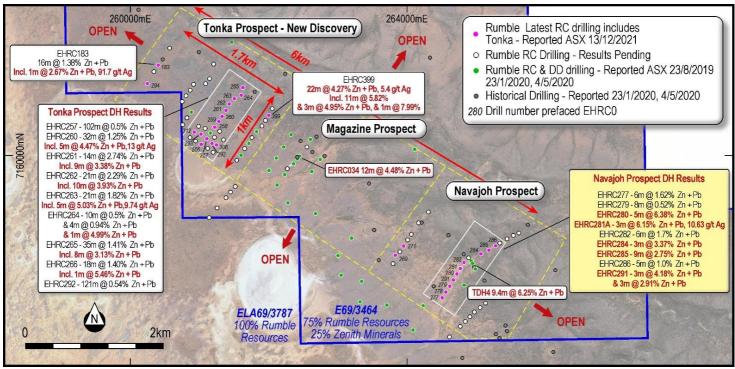

Image 7 -Tonka, Magazine and Navajoh Prospect - Location Plan with Drill Hole Locations and Results

Earaheedy Project - A World Class Base Metal System

As the footprint of the Earaheedy Zn-Pb-Ag-Mn system expands, new styles of mineralisation are being discovered. With the delineation of significant copper mineralisation at Chinook, sericite alteration has been noted which indicates an increase in the metal deposition temperature near and proximal to the feeder faults. Silver is also increasing with cobalt and arsenic being elevated.

The presence of significant copper emphasises the metal zonation that is characteristic of large-scale base metal systems and implies the extensive zinc-lead-silver-manganese mineralisation defined by Rumble to date is the proximal metal zone to a potentially deeper Cu - Zn - Pb - Ag source.

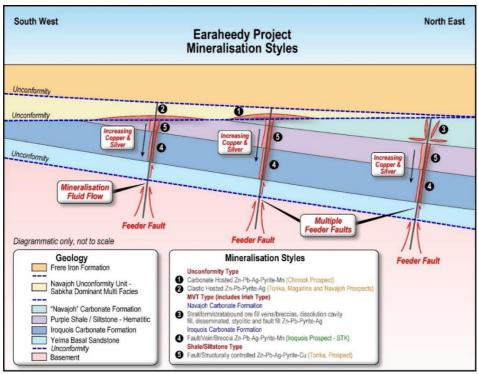

Image 8 - Earaheedy Project - Model of Multiple Mineralisation Styles and targets at Earaheedy

Exploration to the south of the Earaheedy Project area by Strickland Metals has reported significant Zn-Pb-Ag-Mn mineralisation with assays including 23m @ 5.5% Zn + Pb in the Iroquois Carbonate Member at the Iroquois Zn-Pb-Mn Prospect – see image 1 for location (not owned by Rumble - refer ASX announcement by Strickland Metals (ASX: STK) on 14 October 2021). The drilling has demonstrated the lower Iroquois Carbonate Member is very prospective for MVT (Mississippi Valley Type) high-grade Zn-Pb-Ag lodes in association with basement/footwall feeder faults.

Within the Earaheedy Project area, the top of the Iroquois Carbonate Formation has been intersected below the footwall shale by recent drilling (assays pending) by Rumble. At this stage the drilling by Rumble has not targeted MVT style mineralisation. Based on the depth to the top of the Iroquois Carbonate Formation below the recent Rumble drilling at Chinook, Tonka, Magazine and Navajoh, the Iroquois Carbonate Formation is interpreted to hit the surface 2km to 5km (under recent cover) to the south and southwest of the highly prospective unconformity position (see images 1 and 8) and within ELA 69/3787.

Ongoing Exploration Steps

Exploration program for 2021:

The ongoing drilling program has now been expanded to over 50,000m, primarily to further drill and scope the Tonka discovery zone. The drilling is nearing completion for the 2021 season with this announcement reporting on the results of ninety (90) holes for 13959 metres. Assay results returned for the current program is now for 28,144m of drilling (approximately 56% of the planned drilling). The final sets of drilling results are expected by February-March next year.

Exploration program for 2022:

Diamond core drilling

- o Further testing of the major 1.7km long feeder fault zone intersected at Chinook
- o Confirm structural information regarding inferred feeder faults
- o Provide further support for the interpretation of large-scale metal zonation within the Project area.
- Collect material for sighter metallurgical test-work

RC Drilling

- Further scoping of Chinook, Tonka, Magazine and Navajoh to define the limits of mineralisation and infill within the discovery areas - E69/3464
- Drill scoping of Rumble's 100% owned contiguous exploration license ELA 69/3787 (subject to grant).

Sonic drilling

- Superior recoveries recorded in Sonic holes EHS001 and EHS002 compared to diamond drilling within the Navajoh Unconformity Unit (NUU) has supported the Company's decision to restart the Sonic program in 2022. This material will be utilised in further metallurgical test work.
- Sonic drilling will also be used to test all areas of oxide mineralisation.

Metallurgy

Initial sighter test work has commenced

Geophysics

- o Airborne magnetics planned over application areas
- Analysis and testing of gravity and passive seismic is ongoing

About the Earaheedy Project

The Earaheedy Project is located approximately 110km northeast of Wiluna, Western Australia. Rumble owns 75% of E69/3464 and Zenith Minerals Ltd (ASX: ZNC) owns 25%. Rumble has applied (100%) for two contiguous exploration licenses ELA69/3787 and ELA69/3862, south and west of E69/3464. The entire project area covers the inferred unconformity contact between the overlying Frere Iron Formation and underlying Yelma Formation of the Palaeoproterozoic Earaheedy Basin. In April 2021 Rumble announced a major Zinc-Lead Discovery with 'Tier 1' deposit potential at the Earaheedy Project (see ASX Announcement 19 April 2021) and followed this up by announcing a Large Sedex Style System Emerging at the Earaheedy Project (see ASX announcement 25 May 2021) on E69/3464. There are now four main prospects within E69/3464, Chinook, Tonka, Magazine and Navajoh which lie along a 17km corridor which is open into the adjacent exploration license applications (ELA69/3787 and ELA69/3862). Within the project area, Rumble controls 45km of prospective mineralised strike which has the potential for multiple large tonnage Zn–Pb-Ag-Cu deposits - See image 1.

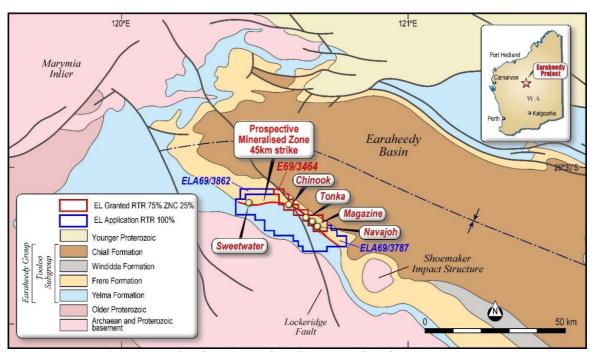

Image 9 - Project Location Plan and Regional Geology

First Stage Exploration Target

Rumble's Zn-Pb exploration target at the Earaheedy Project is between 100 to 120 million tonnes at a grade ranging between 3.5% Zn-Pb to 4.5% Zn-Pb Sulphide. The exploration target is at a shallow depth (120m), and over 40kms of prospective strike (completely open) has been defined within the Earaheedy Project. The potential quantity and grade of the exploration target is conceptual in nature, there has been insufficient exploration to estimate a Mineral Resource and it is uncertain if further exploration will result in the estimation of a Mineral Resource. The exploration target, being conceptual in nature, takes no account of geological complexity, possible mining method or metallurgical recovery factors. The exploration target has been estimated in order to provide an assessment of the potential for large-scale Zn-Pb deposits within the Earaheedy Project. The exploration target has been prepared and reported in accordance with the 2012 edition of the JORC Code.

Earaheedy Zn-Pb Project – Exploration Target							
Range	Tonnes	Grade					
Lower	100,000,000	3.5% Zn + Pb Sulphide					
Upper	120,000,000	4.5% Zn + Pb Sulphide					

Table 1: Near surface exploration target down to 120 metre - shallow depth

The potential quantity and grade of the exploration target is conceptual in nature. There has been insufficient exploration to estimate a Mineral Resource and it is uncertain if further exploration will result in the estimation of a Mineral Resource. The exploration target is based on the current geological understanding of the mineralisation geometry, continuity of mineralisation and regional geology. This understanding is provided by an extensive drill hole database, regional mapping, coupled with understanding of the host stratigraphic sequence.

Included in the data on which this exploration target has been prepared from some 50,000m of drilling completed by Rumble. Historic drilling includes sixty-four (64) holes completed within the project area (E69/3464) by previous explorers (refer historical exploration results in previous ASX announcements dated 5 February 2019 and 12 October 2017, 23rd January 2020 which continue to apply and have not materially changed). Some of the considerations in respect of the estimation of the exploration target include:

- Drilling results have demonstrated strong continuity of shallow, flat lying sulphide mineralisation;
- Over 45km's of prospective strike and open (refer image 1);
- Minimum 600m of width based on shallow 7.5° and shallow depth to 120m, based on drilling results;
- True width (thickness) of mineralisation up to 34 metres received in drilling results; and
- Specific gravity (SG) of 2.5 (world average SG of sandstone not accounting for metal).

The Company intends to test the exploration target with drilling and this further drilling is expected to extend over approximately 12 months. Grade ranges have been either estimated or assigned from lower and upper grades of mineralisation received in drilling results. A classification is not applicable for an exploration target.

Authorisation

This announcement is authorised for release by Shane Sikora, Managing Director of the Company.

-Ends-

About Rumble Resources Ltd

Rumble Resources Ltd is an Australian based exploration company, officially admitted to the ASX on the 1st July 2011. Rumble was established with the aim of adding significant value to its current mineral exploration assets and will continue to look at mineral acquisition opportunities both in Australia and abroad.

Competent Persons Statement

The information in this report that relates to Exploration Results and Exploration Targets is based on and fairly represents information compiled by Mr Brett Keillor, who is a Member of the Australasian Institute of Mining & Metallurgy and the Australian Institute of Geoscientists. Mr Keillor is an employee of Rumble Resources Limited. Mr Keillor has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Keillor consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Previously Reported Information

The information in this report that references previously reported exploration results is extracted from the Company's ASX market announcements released on the date noted in the body of the text where that reference appears. The previous market announcements are available to view on the Company's website or on the ASX website (www. asx.com.au). The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

Disclaimer

This report contains certain forward-looking statements and forecasts, including possible or assumed reserves and resources, production levels and rates, costs, prices, future performance or potential growth of Rumble Resources Ltd, industry growth or other trend projections. Such statements are not a guarantee of future performance and involve unknown risks and uncertainties, as well as other factors which are beyond the control of Rumble Resources Ltd. Actual results and developments may differ materially from those expressed or implied by these forward looking statements depending on a variety of factors. Nothing in this report should be construed as either an offer to sell or a solicitation of an offer to buy or sell securities. This document has been prepared in accordance with the requirements of Australian securities laws, which may differ from the requirements of United States and other country securities laws. Unless otherwise indicated, all ore reserve and mineral resource estimates included or incorporated by reference in this document have been, and will be, prepared in accordance with the JORC classification system of the Australasian Institute of Mining, and Metallurgy and Australian Institute of Geoscientists.

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	 Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	 RC sampling completed on 1m intervals using Metzke Static cone splitter is dry. If wet, sample collected in large polywoven, then allowed to dry for 24 hrs. Sampling was by spear along inside of bag. Weight of sample was on average >2kg. Samples sent to ALS, Malaga, Perth, WA and are being assayed using a four acid digest and read by ICP-AES analytical instrument. At total of 33 elements are reported including Ag, Al, As, Ba, Bi, Ca, Cd, Ce, Co, Cr, Cu, Fe, K, La, Li, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sr, Th, Ti, Tl, U, V, W, Zn.
Drilling techniques	Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.)	 RC face hammer sampling (5.5in diameter). Rig used was an Atlas Copco 220 with 1250cfm air and 435psi compressor.
Drill sample recovery	 Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	 RC drilling cuttings were collected as 1 metre intervals with corresponding chip tray interval kept for reference. In general the dry sample versus the wet sample weight did not vary as the wet sample was collected in a polyweave bag which allowed excess water to seep and kept the drill cutting fines intact in the bag.
Logging	 Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography. The total length and percentage of the relevant intersections logged. 	 Each metre was geologically logged with pXRF analysis. All drill cuttings logged.
Sub- sampling techniques and sample preparation	 If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/secondhalf sampling. Whether sample sizes are appropriate to the grain 	 RC Drilling as below Each metre was analysed by a Vanta pXRF. The Vanta used standards (CRM). If the assay response was >1000ppm Zn, a sample (>2kg) was taken and delivered to ALS for wet analysis. Sampling QA/QC involved a duplicate taken every 20m, and a standard taken every 20m. 4 standards (OREAS CRMs) levels and one blank were used randomly.

Criteria		JORC Code explanation		Commentary
		size of the material being sampled.		
Quality of assay data and laboratory tests	•	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	•	The assigned assaying methodology (4 acid) is total digest. As discussed, the Vanta pXRF analyser was used to threshold the collection of samples for wet analysis. In addition to Rumbles QA/QC methods (duplicates, standards and blanks), the laboratory has additional checks.
Verification of sampling and assaying	•	The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data.	•	Significant intersections reported by company personnel only. Documentation and review is ongoing. Prior to final vetting, entered into database.
Location of data points			•	All drillhole collars surveyed using handheld GPS – Datum is MGA94 Zone 51.
Data spacing and distribution	•	Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied.	•	No resource work completed. The RC drilling is reconnaissance (scoping) by nature with drill hole spacing on average 500m x 100m apart. Single metre and composites used.
Orientation of data in relation to geological structure	•	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	•	Previous drilling (and historic) has defined a consistent flat lying sedimentary package. Drilling is normal (90°) to the mineralised intersections. True width reported. No bias. A single traverse of angled RC holes completed to ascertain if footwall structures could be determined. The single traverse was at -60 and represented approximately 85% of true width.
Sample security	•	The measures taken to ensure sample security.	•	All sampling packaging and security completed by Rumble personnel, from collection of sample to delivery at laboratory.
Audits or reviews	•	The results of any audits or reviews of sampling techniques and data.	•	No audits completed.

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park	 The Earaheedy Project comprises of a granted exploration license – E69/3464 (75% Rumble and 25% Zenith Minerals) and one exploration license application ELA69/3787

16

5
4077

Criteria	JORC Code explanation	Commentary
	 and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	 (100% Rumble) E69/3464 is in a state of good standing and has no known impediments to operate in the area.
Exploration done by other parties	 Acknowledgment and appraisal of exploration by other parties. 	 Exploration solely completed by Rumble Resources
Geology	Deposit type, geological setting and style of mineralisation.	The Earaheedy Project Deposit type is unconformity related sandstone hosted Zn-Pb type. Also MVT (Mississippi Valley Type) to SEDEX style associated with carbonates has been identified. Current work by Rumble has identified unconformity related sandstone hosted Zn Pb type.
Drill hole Information	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: A summary of all information material to the drill holes.	 Table 1 – Near surface exploration target down to 120 metre - shallow depth Table 2 – Chinook Prospect Drill
	 easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	 Hole Locations and Assay Results Table 3 – Navajoh Prospect Drill Hole Locations and Assay Results Table 4 – Regional Drill Hole Locations and Assay Results Table 5 – EHRC136 – Assay Results
Data aggregation methods	 In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	 Historic drilling cut-off grades used include: 0.5% Zn 0.5% Zn + Pb >0.1% Zn The Zn:Pb ratio is variable over the project area. On average the Zn:Pb ratio for sulphide is 3. The average Zn:Pb ratio for oxide is 0.8. Historic drilling – if diamond drilling or RC composite – weighted average used.
Relationship between mineralisation widths and intercept lengths	 These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known'). 	 Drilling is vertical. Mineralisation is flat. Width of mineralisation is true width. A single RC traverse was completed at -60. Intersection represents 85% of true width.
Diagrams	 Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.
