

24 January 2022

North Thorsby Well - step out for growth

Calima Energy Limited ("Calima" or the "Company") (ASX: CE1) is pleased to advise that it has added to the January 2022 drilling program to incorporate a high impact unconventional oil well on its inventory acreage in the Greater Thorsby Area at North Thorsby (Leo #4).

Highlights:

- **Leo #4 spudded** on 20 January 2022 on North Thorsby acreage
- Calima holds a **50% working interest** in the well and is the Operator
- Objective of the well is to **successfully expand the greater Thorsby area**, providing cash flow generation, reserves growth and drilling inventory in a meaningful way to the company
- Capital program funded from **operational cash flows** and **National Bank debt facility**

Jordan Kevol, CEO and President:

"The commencement of the January 2022 drilling campaign reflects a strong start to the year for the Company with the drilling of Leo #4. North Thorsby is a new development area for the Company and Leo #4's level of success will potentially open up additional reserves to book and subsequently develop."

Leo #4 Well, 50% WI

Leo #4 is an unconventional oil well at North Thorsby and spudded on 20 January 2022. The Company holds a 50% WI in the well and the North Thorsby prospect area, which is prospective for the development of multiple Sparky age oil bearing channel sands. The Company holds a significant land position in the North Thorsby area with its partner. No reserves are currently booked in the North Thorsby prospect area. No production facilities are currently owned at North Thorsby, and will be added on an as-needed basis upon success.

North Thorsby contains a series of 18-20 API oil charged Sparky Formation channel sands that contain some of the thickest oil columns in the regional area. North Thorsby is estimated to have over 200MMbbl OOIP with some of the sections approaching an OOIP of 28MMbbl. Active drilling to the east provides strong analogues and the Sparky intervals in North Thorsby are expected to be similar. With this resource scope the area provides the potential for significant locations and reserves growth over time that will be strategically developed.

The well has been designed to test a thick channel for productivity and is the first step in starting to develop the Sparky and expand the greater Thorsby fairway. The well is a horizontal well that will have a cemented liner throughout the horizontal section with a series of multi-cycle frac ports spaced approximately 42 meters apart within the portion of the wellbore that encountered the Sparky Formation.

The Company plans to frac and tie-in the well in late Q2 or Q3 2022, pending spring break-up conditions. Due to weather conditions and spring break-up, timing for this work has not been finalized, however it will be planned to most effectively minimize overall capital expenditures and risk of overruns.

The target Sparky intervals contain 10-30m of pay-zone with an average porosity of 15% and a corresponding average permeability of 15mD. The Company currently has inventory of 20-30 potential HZ locations with room to add additional locations with minor offset land purchases/leasing.

Typical Sparky drilling and production timeframes

* Clean-up is the period that water and drilling fluids are recovered from the completion and at after which time commercial hydrocarbons begin to flow from the reservoir. Expect LEO # 4 to be on production in Q3 2022.

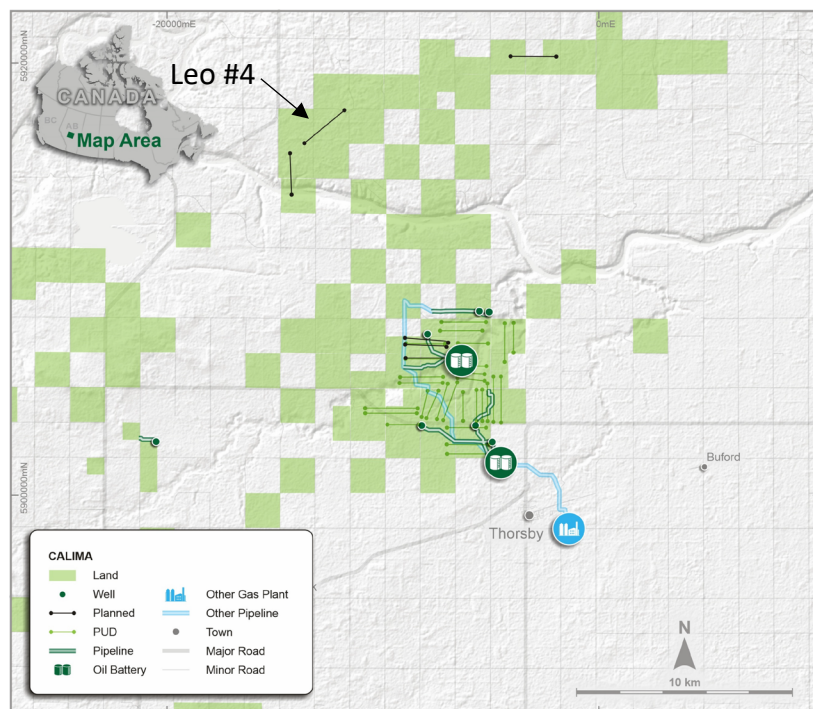

Figure 1: Thorsby Field

Sparky Economics

Calima has drilled 14 Sparky wells to date. Leo #4 will be a 3rd generation Sparky well utilizing longer lateral length, and more intensive fracture stimulation compared to Generation 2 Sparky wells from 2018-2019. 3rd Generation Sparky wells average 1.0 ton of frac sand per meter over the horizontal length during completion.

The North Thorsby well is budgeted for \$3.6 million (\$1.8 net) for drilling and completion, as this is a “one-off well” and will not receive the benefits of economies of scale when multiple wells are drilled in a program. The equip and tie-in costs for this well are estimated at \$1.1 million (\$0.55 net) as the Company does not have any existing infrastructure in the North Thorsby area, therefore this well will be

set up as a “single well battery” during its evaluation stage. The Company’s 50% share of initial drilling costs this quarter will be ~\$750,000.

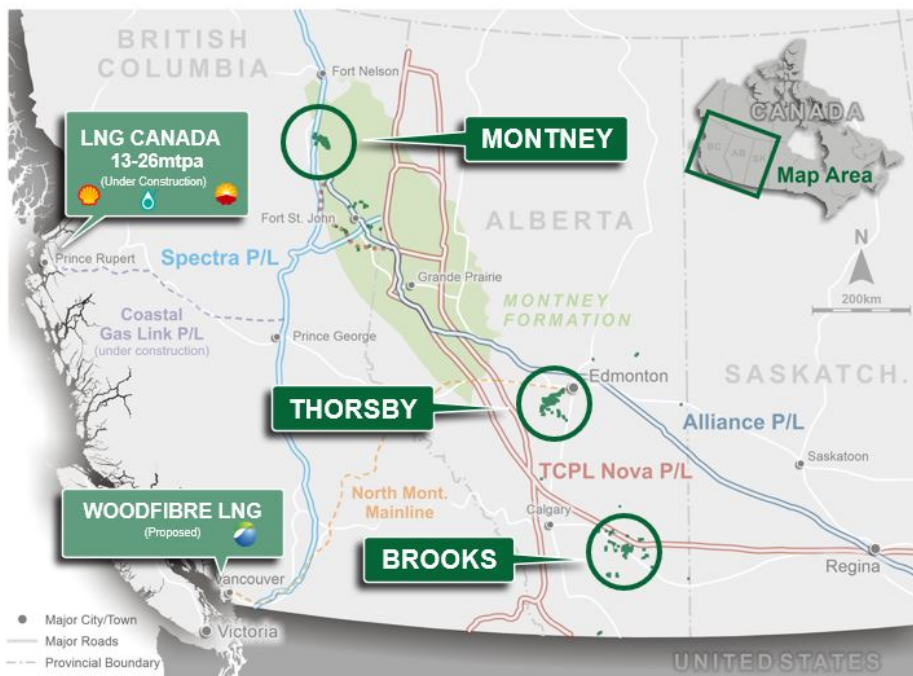

More wells may be drilled in the area upon success with the first North Thorsby well. There are no horizontal Sparky Formation wells drilled in the North Thorsby area, nor any existing production from the Sparky age rock. Therefore, detailed economics on the North Thorsby prospect are not being provided at this time. Once IP90 rates have been achieved later this year, an update on the productivity of Leo #4 will be provided. An update regarding drilling success, and perceived reservoir quality will be provided subsequent to the completion of drilling.

This release has been approved by the Board.

Qualified petroleum reserves and resources evaluator statement

The petroleum reserves and resources information in this announcement in relation to Blackspur Oil Corp is based on, and fairly represents, information and supporting documentation in a report compiled by InSite Petroleum Consultants Ltd. (InSite) for the June 30, 2021 Reserves Report. InSite is a leading independent Canadian petroleum consulting firm registered with the Association of Professional Engineers and Geoscientists of Alberta. These reserves were subsequently reviewed by Mr. Graham Veale who is the VP Engineering with Blackspur Oil Corp. The InSite June 30, 2021 Reserves Report and the values contained therein are based on InSite's June 30, 2021 price deck (<https://www.insitepc.com/pricing-forecasts>). Mr. Veale holds a BSc. in Mechanical Engineering from the University of Calgary (1995) and is a registered member of the Alberta Association of Professional Engineers and Geoscientists of Alberta (APEGA). He has over 25 years of experience in petroleum and reservoir engineering, reserve evaluation, exploitation, corporate and business strategy, and drilling and completions. InSite and Mr. Veale have consented to the inclusion of the petroleum reserves and resources information in this announcement in the form and context in which it appears.

Oil and Gas Glossary and Definitions

Term	Meaning
Adjusted EBITDA:	Adjusted EBITDA is calculated as net income (loss) before interest and financing expenses, income taxes, depletion, depreciation and amortisation, and adjusted to exclude certain non-cash, extraordinary and non-recurring items primarily relating to bargain purchase gains, gains and losses on financial instruments, transaction and advisory costs and impairment losses. Calima utilises adjusted EBITDA as a measure of operational performance and cash flow generating capability. Adjusted EBITDA impacts the level and extent of funding for capital projects investments or returning capital to shareholders.
Adjusted working capital:	Adjusted working capital is comprised of current assets less current liabilities on the Company's balance sheet and excludes the current portions of risk management contracts and credit facility draws. Adjusted working capital is utilised by Management and others as a measure of liquidity because a surplus of adjusted working capital will result in a future net cash inflow to the business which can be used for future funding, and a deficiency of adjusted working capital will result in a future net cash outflow which will require a future draw from Calima's existing funding capacity.
ARO / Asset Retirement Obligation:	the process of permanently closing and relinquishing a well by using cement to create plugs at specific intervals within a well bore
Available funding:	Available funding is comprised of adjusted working capital and the undrawn component of Blackspur's credit facility. The available funding measure allows Management and other users to evaluate the Company's liquidity.
Credit Facility Interest:	Borrowings under the Credit Facility incur interest at a market-based interest rate plus an applicable margin which varies depending on Blackspur's net debt to cash flow ratio. Interest charges are between 150 bps to 350 bps on Canadian bank prime borrowings and between 275 bps and 475 bps on Canadian dollar bankers' acceptances. Any undrawn portion of the demand facility is subject to a standby fee in the range of 20 bps to 45 bps. Security for the credit facility is provided by a C\$150 million demand debenture
CO2e:	carbon dioxide equivalent
Conventional Well:	a well that produces gas or oil from a conventional underground reservoir or formation, typically without the need for horizontal drilling or modern completion techniques
Compression:	a device or facility located along a natural gas pipeline that raises the pressure of the natural gas flowing in the pipeline, which in turn compresses the natural gas, thereby both increasing the effective capacity of the pipeline and allowing the natural gas to travel longer distances
Corporate Decline:	consolidated, average rate decline for net production from the Company's assets
Exit Production:	Exit production is defined as the average daily volume on the last week of the period
Operating Income:	Oil and gas sales net of royalties, transportation and operating expenses
Financial Hedge:	a financial arrangement which allows the Company to protect against adverse commodity price movements, the gains or losses of which flow through the Company's derivative settlements on its financial statements
Free Cash Flow (FCF):	represents Hedged Adjusted EBITDA less recurring capital expenditures, asset retirement costs and cash interest expense
Free Cash Flow Yield:	represents free cash flow as a percentage of the Company's total market capitalisation at a certain point in time
Funds Flow:	Funds flow is comprised of cash provided by operating activities, excluding the impact of changes in non-cash working capital. Calima utilises funds flow as a measure of operational performance and cash flow generating capability. Funds flow also impacts the level and extent of funding for investment in capital projects, returning capital to shareholders and repaying debt. By excluding changes in non-cash working capital from cash provided by operating activities, the funds flow measure provides a meaningful metric for Management and others by establishing a clear link between the Company's cash flows, income statement and operating netbacks from the business by isolating the impact of changes in the timing between accrual and cash settlement dates.
Gathering & Compression (G&C):	owned midstream expenses; the costs incurred to transport hydrocarbons across owned midstream assets

Term	Meaning
Gathering & Transportation (G&T):	third-party gathering and transportation expense; the cost incurred to transport hydrocarbons across third-party midstream assets
G&A:	general and administrative expenses; may be represented by recurring expenses or non-recurring expense
Hedged Adjusted EBITDA:	EBITDA including adjustments for non-recurring and non-cash items such as gain on the sale of assets, acquisition related expenses and integration costs, mark-to-market adjustments related to the Company's hedge portfolio, non-cash equity compensation charges and items of a similar nature;
Hyperbolic Decline:	non-exponential with subtle multiple decline rates; hyperbolic curves decline faster early in the life of the well and slower as time increases
LMR:	The LMR (Liability Management Ratio) is determined by the Alberta Energy Regulator ("AER") and is calculated by dividing Blackspur's deemed assets by its deemed liabilities, both values of which are determined by the AER.
LOE:	lease operating expense, including base LOE, production taxes and gathering & transportation expense
Midstream:	a segment of the oil and gas industry that focuses on the processing, storing, transporting and marketing of oil, natural gas, and natural gas liquids
Net Debt"	Net debt is calculated as the current and long-term portions of Calima's credit facility draws, lease liabilities and other borrowings net of adjusted working capital. The credit facility draws are calculated as the principal amount outstanding converted to Australian dollars at the closing exchange rate for the period. Net debt is an important measure used by Management and others to assess the Company's liquidity by aggregating long-term debt, lease liabilities and working capital.
NGL / Natural Gas Liquids:	hydrocarbon components of natural gas that can be separated from the gas state in the form of liquids
Net Debt/Adjusted EBITDA (Leverage)	a measure of financial liquidity and flexibility calculated as Net Debt divided by Hedged Adjusted EBITDA
Net Revenue Interest:	a share of production after all burdens, such as royalty and overriding royalty, have been deducted from the working interest. It is the percentage of production that each party actually receives
Operating Costs:	total lease operating expense (LOE) plus gathering & compression expense
Operating Netback:	Operating netback is calculated on a per boe basis and is determined by deducting royalties, operating and transportation from oil and natural gas sales, after adjusting for realised hedging gains or losses. Operating netback is utilised by Calima and others to assess the profitability of the Company's oil and natural gas assets on a standalone basis, before the inclusion of corporate overhead related costs. Operating netback is also utilised to compare current results to prior periods or to peers by isolating for the impact of changes in production volumes.
Physical Contract:	a marketing contract between buyer and seller of a physical commodity which locks in commodity pricing for a specific index or location and that is reflected in the Company's commodity revenues Production Taxes: state taxes imposed upon the value or quantity of oil and gas produced
Promote:	an additional economic ownership interest in the jointly-owned properties that is conveyed cost-free to the operator in consideration for operating the assets
PDP/ Proved Developed Producing:	a reserve classification for proved reserves that can be expected to be recovered through existing wells with existing equipment and operating methods
PV10:	a standard metric utilised in SEC filings for the valuation of the Company's oil and gas reserves; the present value of the estimated future oil and gas revenues, reduced by direct expenses, and discounted at an annual rate of 10%
RBL / Reserve Based Lending	a revolving credit facility available to a borrower based on (secured by) the value of the borrower's oil and gas reserves
Royalty Interest or Royalty:	Interest in a leasehold area providing the holder with the right to receive a share of production associated with the leasehold area
Terminal decline:	represents the steady state decline rate after early (initial) flush production
tCO2:	Tonnes of Carbon Dioxide
Unconventional Well:	a well that produces gas or oil from an unconventional underground reservoir formation, such as shale, which typically requires hydraulic fracturing to allow the gas or oil to flow out of the reservoir
Upstream:	a segment of the oil and gas industry that focuses on the exploration and production of oil and natural gas
Working Capital Ratio:	The working capital ratio as the ratio of (i) current assets plus any undrawn availability under the facility to (ii) current liabilities less any amount drawn under the facilities. For the purposes of the covenant calculation, risk management contract assets and liabilities are excluded.
WI/ Working Interest:	a type of interest in an oil and gas property that obligates the holder thereof to bear and pay a portion of all the property's maintenance, development, and operational costs and expenses, without giving effect to any burdens applicable to the property
