02 March 2022

## High powered ground geophysics identifies robust conductors at Mt Isa East Cu-Au Project

### Highlights

- A high powered fixed loop ground electromagnetic survey (FLEM) has identified a robust conductor at the Python prospect, modelled as a shallow south-easterly plunging anomaly, extending approximately 420m long and 100m down-dip
- Significantly, the Python conductor is coincident with a north-westerly trending regional fault, possibly important in focusing copper mineralisation
- A separate FLEM survey has identified a conductive zone at King Solomon coincident with the known mineralised trend, striking over 1.2km with Cooper's rock chip samples previously returning up to 16.65% Cu and 2.58g/t Au<sup>1,2</sup>
- The FLEM conductors at Python and King Solomon are coincident with airborne Versatile Time Electromagnetic (VTEM) conductors, interpreted by Cooper's consultant geophysicist from a 2016 regional VTEM survey
- The FLEM surveys have helped to define a robust drill target at Python, and a developing model at King Solomon, whilst other regional VTEM conductors identified on Cooper's ground will now be subjected to further investigation

### Cooper Metals Managing Director Ian Warland, commented:

*"I am highly encouraged that our first high-powered fixed loop electromagnetic survey at Mt Isa East has identified conductors at both the Python and King Solomon Cu-Au prospects. The Python conductor is especially exciting with the modelled conductor extending for over 400m and coincident with a significant regional fault. The use of publicly available VTEM data led Cooper to the Python conductor, confirming our strategy to use VTEM as an effective way of screening our tenure for sulphide rich deposits. To this end, Cooper has already signed a contract to complete a detailed VTEM in the June Quarter. Importantly, Cooper now has initial targets for drill testing and our highest priority is to organise a drill program, while continuing to generate a pipeline of high-quality Cu-Au targets."*

Cooper Metals Limited (ASX: CPM) (“CPM” or “the Company”) is pleased to announce the preliminary results of the fixed loop electromagnetic survey (FLEM) at the Python and King Solomon Cu-Au Prospects located at our Mt Isa East Project in northwestern Queensland (Figure 1).

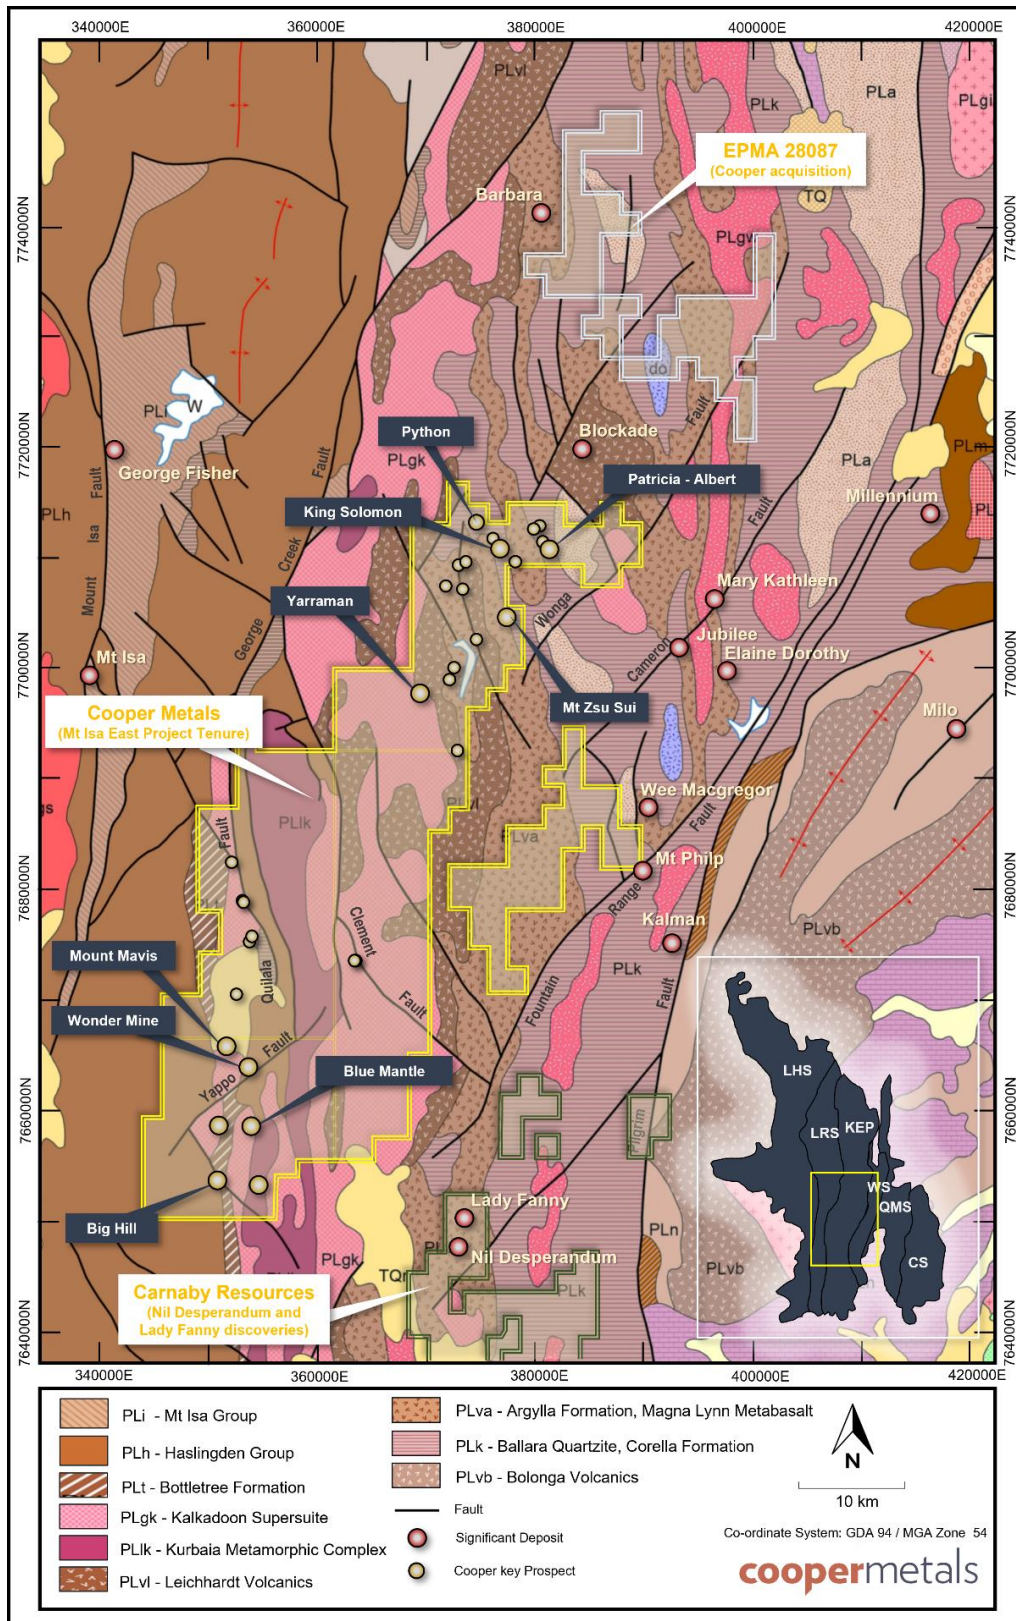

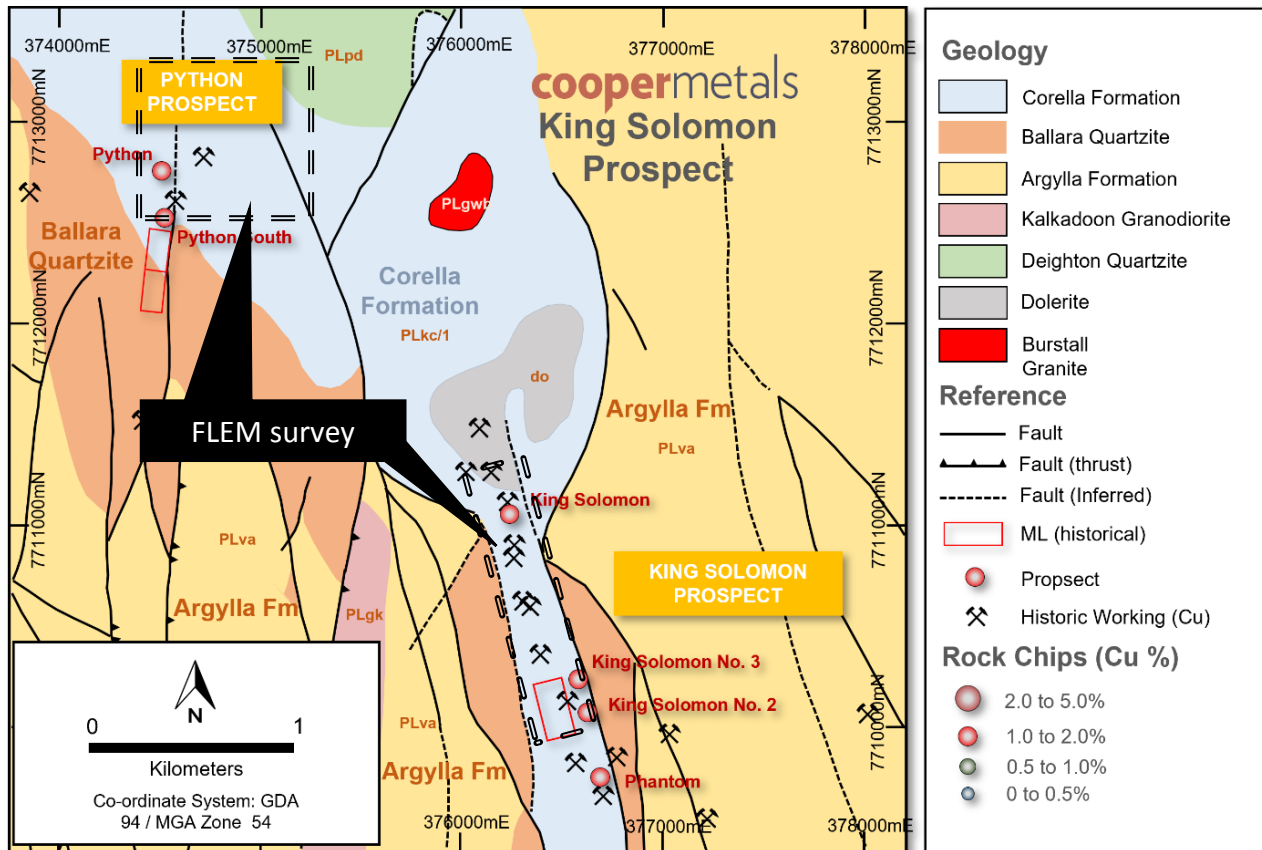

Figure 1: Mt Isa East Project over regional geology and main prospects

The FLEM program just finished on the 26<sup>th</sup> of February and initial results are now available.

## Geophysical Program Rationale and Details

Copper-gold (Cu-Au) mineralisation at the Python and King Solomon Prospects is hosted in mixed siltstones, sandstones, and limestone of the Corella Formation. Both prospects have extensive historical workings in the form of shafts and small open pits, significantly without any recorded drill testing. The geophysical program comprised two separate survey blocks over each prospect with each block consisting of several traverses of three-component FLEM. The high-powered FLEM survey is the first of this type conducted on these historical prospects and was designed to identify the presence of conductive anomalies under the old workings that may indicate the presence of copper sulphide mineralisation at depth (Figure 2).

**Figure 2: Location of King Solomon and Python Prospect FLEM survey over geology (source: After CPM Prospectus)**

### Python Cu Prospect

A single FLEM survey loop completed over Python prospect has identified a robust conductor at the northeastern end of the prospect approximately 500m from known copper mineralisation and historical workings (Figure 4). **The conductor was modelled as a shallow southeasterly plunging body approximately 420m long and 100m down dip, projecting back to the surface (Figure 3).** The conductor is coincident with a significant northwesterly trending fault that may have been important in hosting copper mineralisation.

Encouragingly, the FLEM conductor is coincident with an airborne Versatile Time Domain Electromagnetic (VTEM) anomaly identified by Cooper's consultant geophysicist from a publicly available regional VTEM survey commissioned by the Queensland Government in 2016. This proof of concept bodes well for other VTEM anomalies that have already been identified in Cooper's tenure. There are no known workings or surface geochemistry in the vicinity of the Python FLEM conductor.

The modelled conductor identified in the FLEM survey provides Cooper with a robust drill target that will be drill tested as soon as the necessary approvals and arrangements have been made. The historical workings at Python (which are offset 500m from the new FLEM anomaly) did not resolve

any conductor responses, which suggests a disseminated style of mineralisation or lack of conductive sulphides. The historical workings will be further tested as part of the broader drill program planned at Python.

Figure 3: Long section of modelled FLEM conductor at Python Prospect

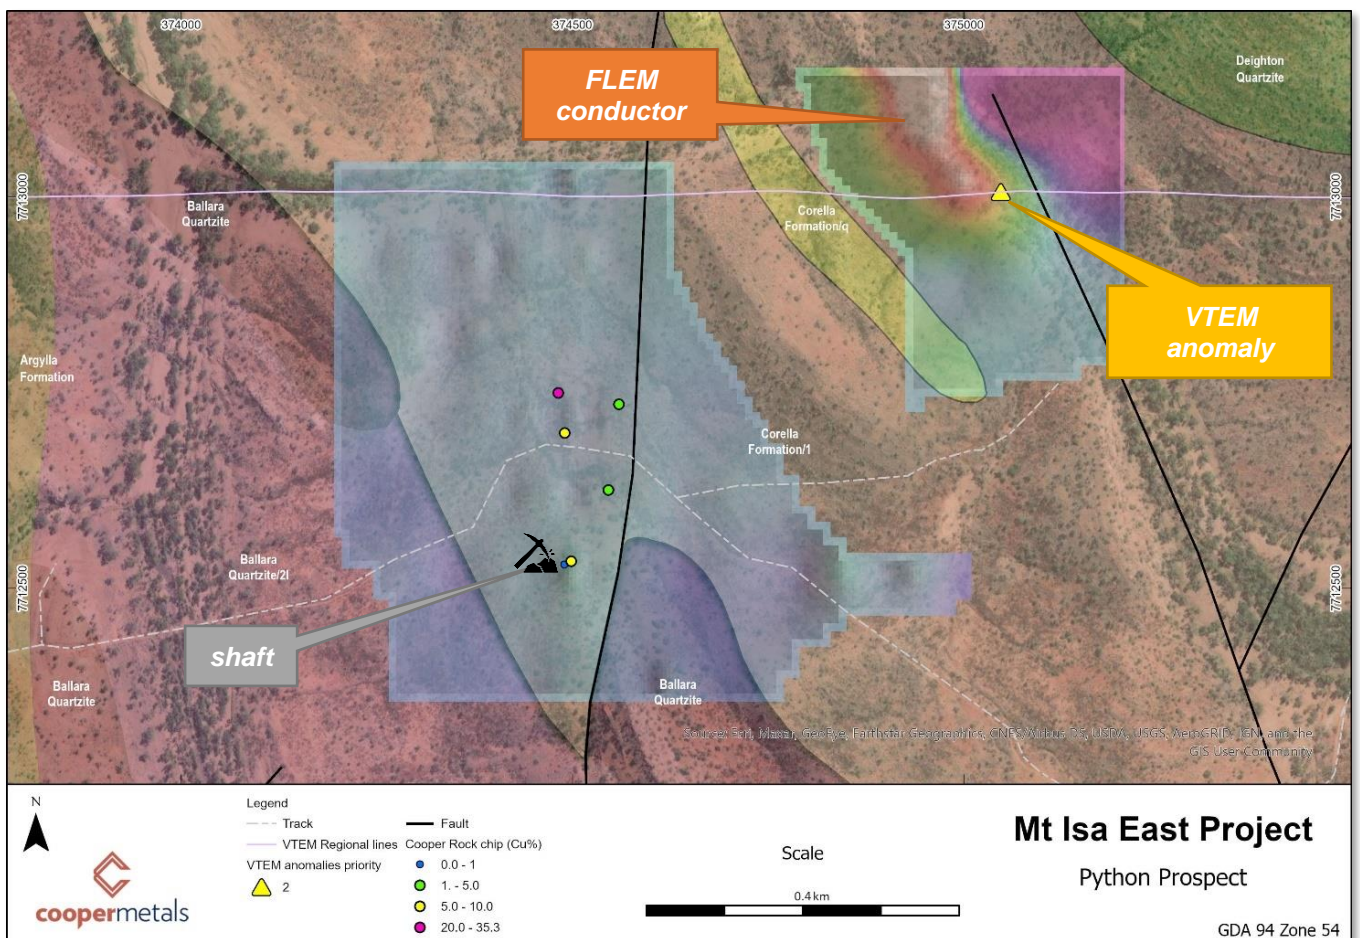

Figure 4: Python Prospect FLEM results channel 20 amplitude image

### King Solomon Cu-Au Prospect

Two FLEM loops were used to cover ~1.2km length of mineralised trend, as defined from historical workings and surface geochemistry. Encouragingly the FLEM has mapped a conductive response coincident with the Cu-Au mineralised trend. The higher conductive response is in the northern part of the prospect area around King Solomon 1 and is potentially mapping out copper sulphide mineralisation at depth. Modeling of the FLEM response at King Solomon is in progress to define the best targets for drill testing.

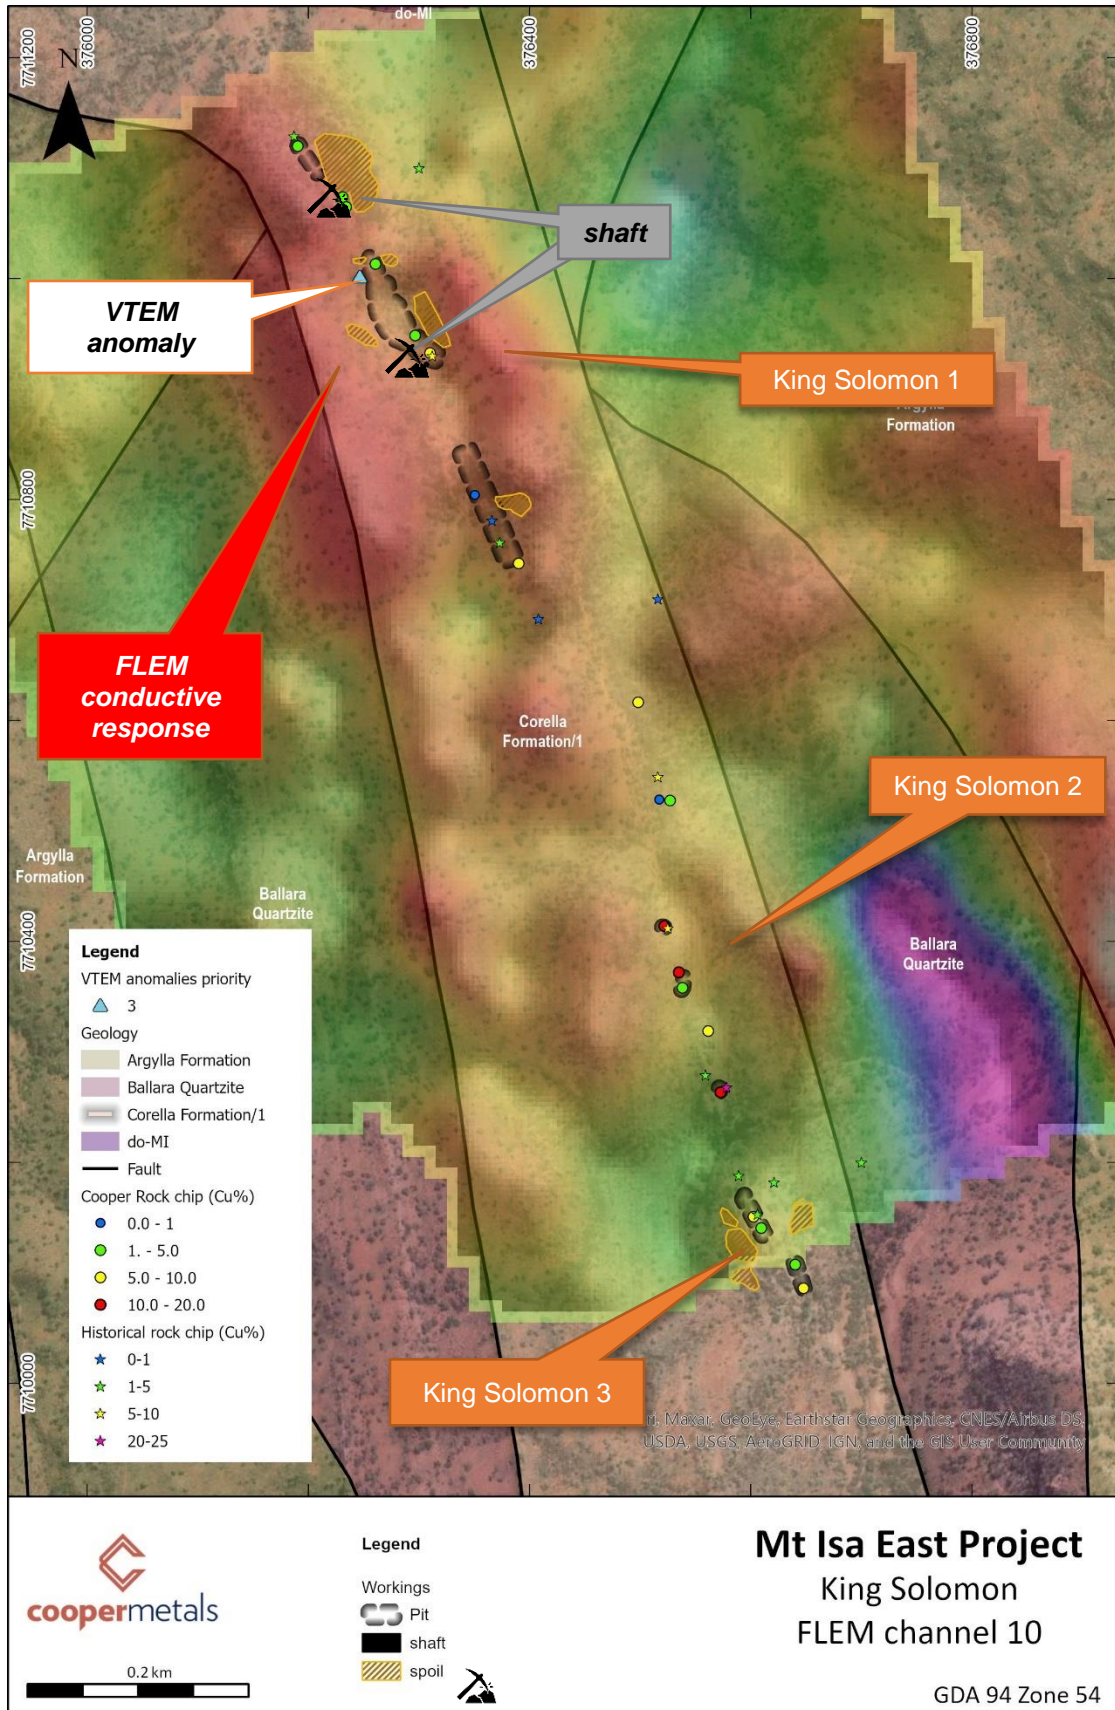

Figure 5: King Solomon FLEM channel 10 amplitude image, and rock chips assays

Significantly, as with the Python prospect, the King Solomon prospect also has a VTEM anomaly coincident with the FLEM anomaly, adding confidence to the applicability of the Queensland Government's 2016 regional VTEM survey for identifying potential Cu-Au anomalies (**Figure 5**). In addition to the VTEM anomalies associated with the Python and King Solomon, Cooper's consultant geophysicist has identified several other regional VTEM anomalies on Cooper's tenure which will be followed up with a detailed VTEM survey in the June Quarter.

Mt Zsu Sui Prospect was tested with two FLEM loops as a trial, while the access to Python and King Solomon prospects was temporarily closed by swollen river crossings. No significant conductive responses were found at Mt Zsu Sui. An induced polarisation (IP) trial is being considered at a later date.

### Next Steps

- Complete FLEM modelling of King Solomon prospect
- Ground truth new conductors at Python and King Solomon prospects
- Finalise drill planning and approvals ahead of drill testing
- Finalise detailed VTEM survey planning

The Board of Cooper Metals Limited has approved this announcement and authorised its release on the ASX.

### COMPETENT PERSON'S STATEMENT:

*The information in this report that relates to **Geophysical Exploration Results** is based on information compiled by Kelvin Blundell, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy. Mr Blundell, who is employed as a Consultant to the Company through geophysical consultancy. Mr Blundell has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Blundell consents to the inclusion in the report of the matters based on his information and the form and context in which it appears.*

*The information in this report that relates to **Geological Interpretation and Exploration Results** is based on information compiled by Ian Warland, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy. Mr Warland is employed by Cooper Metals Limited. Mr Warland has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Warland consents to the inclusion in the report of the matters based on his information and the form and context in which it appears.*

1. ASX CPM: 1 December 2021: Early Fieldwork programs at Mt Isa East return rock chip assays up to 35.3% Cu and 7.96 g/t Au
2. ASX CPM: 7 February 2022: Follow-up rock chip sampling continues to demonstrate wide-spread Cu and Au mineralisation at Mount Isa East

## About Cooper Metals Limited

Cooper Metals Ltd (ASX: CPM) is an ASX-listed explorer with a focus on copper and gold exploration. CPM aims to build shareholder wealth through discovery of mineral deposits. The Company has three projects all in proven mineralised terrains with access to infrastructure. The Projects are detailed briefly below:

### **Mt Isa East Project (Qld)**

Cooper Metal's flag ship Mt Isa East Cu-Au Project covers ~1300 sq.km of tenure with numerous historical Cu-Au workings and prospects already identified for immediate follow up exploration. The Mt Isa Inlier is highly prospective for iron oxide copper gold (IOCG), iron sulphide copper gold (ISCG) and shear hosted Cu +/- Au deposits.

### **Yamarna Gold Project (WA)**

The Yamarna Gold Project located along strike from Gold Roads 6.16 Moz world class Gruyere Gold Deposit (ASX: GOR) has an extensive length of untested Dorothy Hills Shear Zone that was important in the formation of Gruyere gold deposit located ~10 km to the southeast of Cooper's tenements.

### **Gooroo Project (WA)**

Lastly the Gooroo Cu and or Au Project covers newly identified greenstone belt ~20 km from Silver Lakes (ASX: SLR) Deflector mine. The 26 km expanse of covered greenstone belt has had almost no exploration and was only added to government geology maps in 2020 after reinterpretation of geophysical data.
