

Several EM anomalies identified at Lake Johnston Ni-Cu-PGE Project

- Interpretation of SkyTEM AEM survey data has delineated several anomalies indicative of potential sulphide conductors
- All anomalies are located on or proximal to the margins of the Jimberlana Dyke
- The Jimberlana Dyke is known to contain layered intrusions, prospective for Ni-Cu-PGE mineralisation

Rubix Resources Limited (“Rubix” or the “Company”) is pleased to advise the interpreted results from a SkyTEM FAST airborne electromagnetic (AEM) survey completed over its 100% owned Lake Johnston Project (“Project”). The Project has an area of 63km² and is located approximately 105km west of Norseman, adjacent to the Archaean Lake Johnston greenstone belt and covering a portion of the Jimberlana Dyke. The Emily Ann and Maggie Hays nickel mines, held by Poseidon Nickel Limited lie to the west of the Project.

Recently completed interpretation of the AEM survey has delineated several encouraging anomalies located on and proximal to the margins of the Jimberlana Dyke. Three of these anomalies are deemed priority for investigating the potential for sulphide conductors related to layered intrusions occurring within the Jimberlana Dyke.

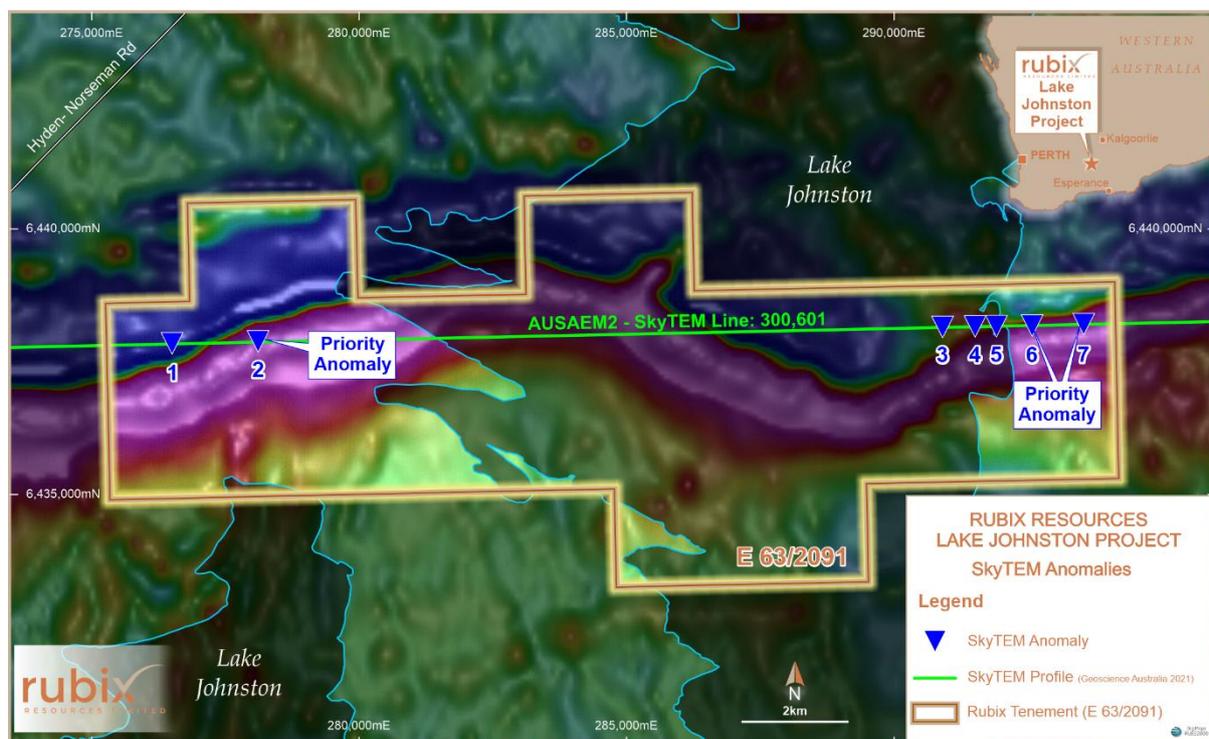

Figure 1: SkyTEM anomalies over TMI Magnetics

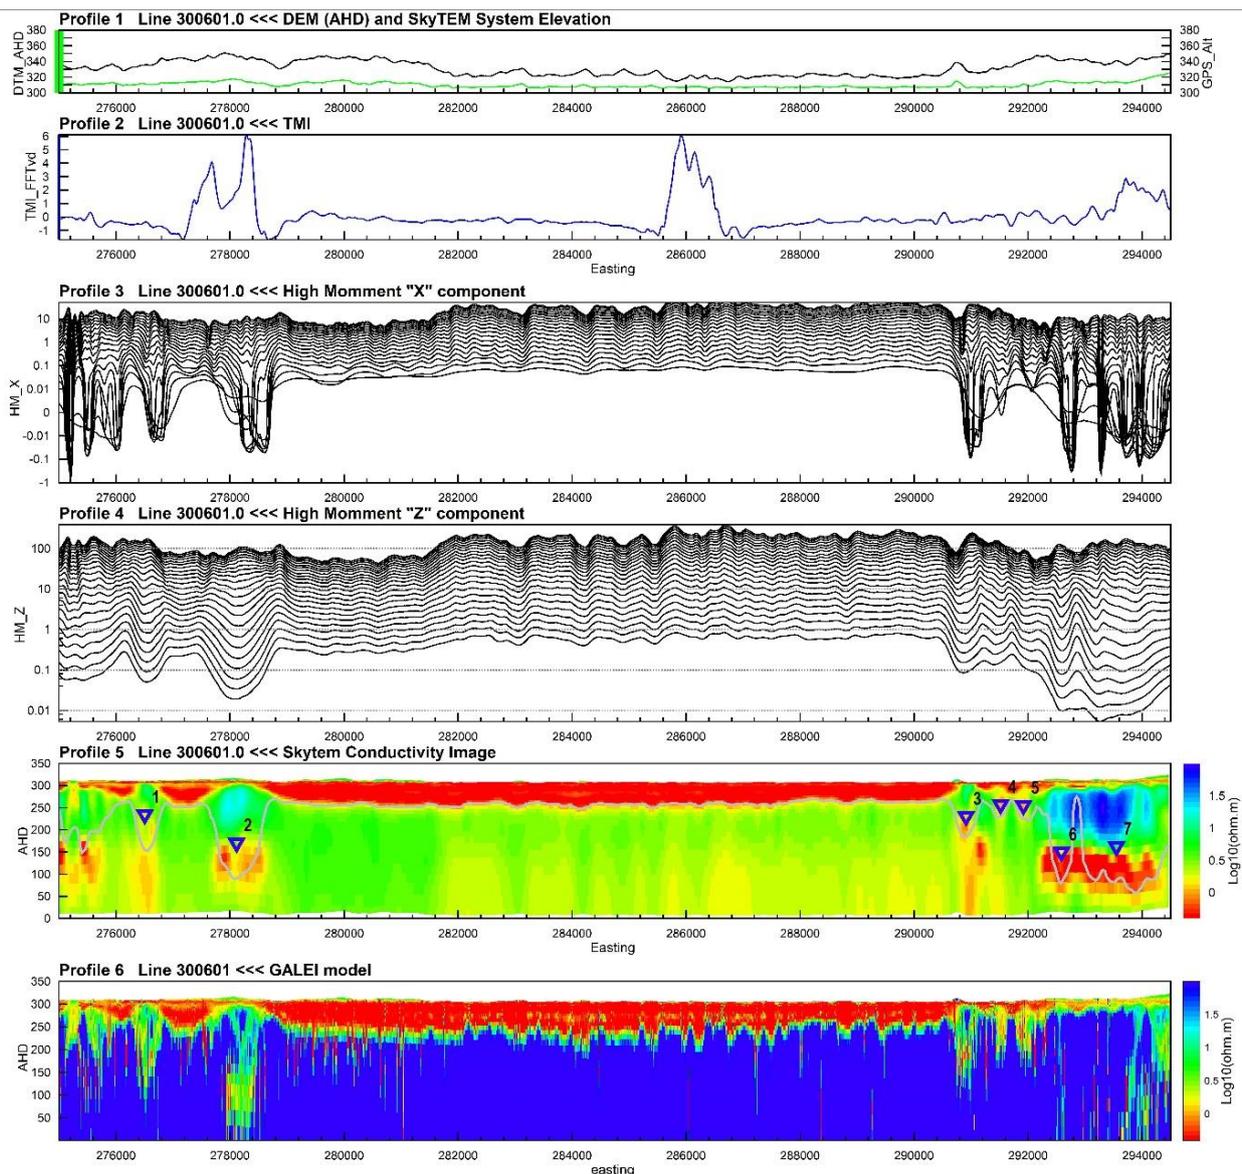

Figure 2: SkyTEM profiles with anomalies marked

The Jimberlana Dyke is an intrusive body which has a maximum width of 3km crosscuts the Archaean greenstone belts and granites of the Yilgarn Craton. The dyke is orientated east-west which is parallel to the other major Proterozoic dyke swarms which cut the Yilgarn craton such as the Binneringie Dyke, however it can be considered unique as it contains layered mafic complexes.

The complexes have been divided vertically into three distinct successions of layered rocks termed the Upper, Lower and Marginal Layered Series, and can be considered analogous to the Great Dyke of Zimbabwe which contains accumulations of massive base metals and is the world's third-largest resource of PGEs, ranking only behind the Bushveld Complex in South Africa and Norilsk in Russia.

The potential of the Jimberlana dyke has recently been highlighted with Galileo Mining Limited (ASX: GAL) intercepting massive sulphide mineralisation in shallow air core drilling, with subsequent interpretation of EM data showing that the sulphide occurrence is located at the confluence of two large and highly conductive bodies (see GAL announcements dated 1 December 2021 and 9 February 2022).

The AEM anomalies delineated represent an exciting exploration opportunity for the Company, where limited activities have been historically undertaken.

AEM Survey details

Geoscience Australia (GA) and the Geological Survey of Western Australia (Department of Mines, Industry Regulation and Safety) commissioned the AusAEM-WA survey as part of the national AusAEM airborne electromagnetic acquisition program (Ley-Cooper et.al, 2019), to complete 20 km line separation AEM coverage over WA. Flight-lines were flown to deliberately intersect geological points of interest, including outcrops, boreholes, locations with mineral occurrences and over areas with known kimberlite and meteorite impacts.

The survey was divided and flown, for logistical reasons, into four blocks. Block C, made up close to 4,200 line-km flown in an east-west direction over southern goldfields region of WA, with line 300601 flown along the Jemberlana Dyke which transverses the Lake Johnston Project from east to west in the middle of the tenement (Figure 1).

The program was designed to deliver freely available pre-competitive geophysical data to assist in the investigation and discovery of potential mineral, energy and groundwater resources within Australia. Funding for the survey came from the Western Australian government's Exploration Incentive Scheme and additional support from the State's COVID-19 recovery plan.

The dataset was released in November 2021 by the Geological Survey of Western Australia (GSWA) in collaboration with Geoscience Australia (GA).

GA managed the survey data acquisition, processing, contracts, quality control of the survey and also generated the inversion products included in the data package. The data package is available from Geoscience Australia's website at address: <http://pid.geoscience.gov.au/dataset/ga/146042> and from GSWA's GeoVIEW.WA web mapping application.

The survey utilised SkyTEM Fast helicopter airborne electromagnetic system flown under contract to GA in 2020. SkyTEM also processed the data. A summary of the survey specifications is provided in Table 1.

Table 1 Summary of the AusAEM 2020(WA) Airborne Electromagnetic Survey.

Survey Name	SkyTEM AusAEM-WA, Southwest-Albany Airborne Electromagnetic Survey
State	Western Australia
Custodian	Geoscience Australia
Contractor	SkyTEM Australia Pty Ltd
Aircraft	Company United Aero Helicopter Type AS350 B3
AEM System	SkyTEM ³¹² FAST (Interleaved Low Moment and High Moment)
Line Spacing	20 km
Line Direction	E-W and N-S variable line direction
Total Survey Line Kilometres	12,500 km

This announcement has been approved for release by the Board.

FOR FURTHER INFORMATION:

Eddie King
Executive Chairman

Competent Person Statement

The information in this announcement is based on and fairly represents information compiled by Mr Nigel Wilson, consultant geologist, who is a Member of the Australian Institute of Geoscientists and is an accurate representation of the available data and studies for the Project. Mr Wilson has sufficient experience relevant to the style of mineralisation and type of deposit under consideration, and to the activity which he has undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Wilson consents to the inclusion in this announcement of the matters based on this information in the form and context in which it appears.

Geophysical Information in this report is based on exploration data modelled by David McInnes, who is engaged as a geophysical consultant through Montana GIS. Mr McInnes is a member of the Australian society of Exploration Geophysicists and has sufficient experience of relevance in the types of survey's completed and the types of mineralisation under consideration.

Forward Looking Statements

Forward-looking statements are statements that are not historical facts. Words such as "expect(s)", "feel(s)", "believe(s)", "will", "may", "anticipate(s)" and similar expressions are intended to identify forward-looking statements. These statements include, but are not limited to statements regarding future production, resources or reserves and exploration results. All of such statements are subject to certain risks and uncertainties, many of which are difficult to predict and generally beyond the control of the Company, that could cause actual results to differ materially from those expressed in, or implied or projected by, the forward-looking information and statements. Our audience is cautioned not to place undue reliance on these forward-looking statements that speak only as of the date hereof, and we do not undertake any obligation to revise and disseminate forward-looking statements to reflect events or circumstances after the date hereof, or to reflect the occurrence of or non-occurrence of any events.

JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary																																				
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (e.g., cut channels, random chips, or specific specialized industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverized to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> The survey was flown utilising a AS350 B3 helicopter and acquired with the SkyTEM FAST (Interleaved Low Moment and High Moment) EM system. Geoscience Australia (GA) and the Geological Survey of Western Australia (Department of Mines, Industry Regulation and Safety) commissioned the AusAEM-WA survey as part of the national AusAEM airborne electromagnetic acquisition program. GA managed the survey data acquisition, processing, contracts, quality control of the survey and also generated the inversion products included in the data package. The data package is available from Geoscience Australia's website at address: http://pid.geoscience.gov.au/dataset/ga/146042 and from GSWA's GeoVIEW.WA web mapping application. Terrain clearance of 45 – 60 m (nominal) Line 300601 was flown along the Jimberlana Dyke which transverses the Lake Johnston Project from east to west in the middle of the tenement. Section 2 Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> The Lake Johnston Project comprises one tenement, E63/2091, which is granted and 100% held by Rubix Resources Limited Rubix is not in partnership or any joint venture with respect to the Project. The Project is within the Ngadju native title determined area (WAD6020/1998, WCD2014/004). Rubix and Ngadju have executed a Heritage Protection Agreement to enable Rubix to undertake exploration activities within the tenement. The Project contains 1 registered Aboriginal site: ID: 17711, Name: Maggie Hays Ethnographic Site 3, Type: Mythological A proposed Nature Reserve (PNR 83) – Dept of Parks & Wildlife – Conservation Commission of WA encroaches 3.04% of the Project.
Exploration by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> The Project area has very limited exploration work. Regionally, Tempest airborne EM data was collected over the Jimberlana Dyke by Anaconda Limited in 1999 to determine the potential for bedrock conductors. Modelling of the wide-spaced airborne EM data has revealed several strong bedrock conductors located within the Dyke margins as well as the host rocks. Avoca Resources Limited undertook a structural interpretation using all available aeromagnetic data which included historic contour plans of data collected by WMC along N-S flight lines.
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> The Project is located adjacent to the Archaean Lake Johnston greenstone belt and covers a portion of the Jimberlana Dyke. The Jimberlana Dyke is an intrusive body which has a maximum width of 3km, crosscuts the Archaean greenstone belts and granites of the Yilgarn Craton. The Jimberlana Dyke is orientated east-west and can be considered unique as it contains layered mafic complexes. This feature may be prospective for nickel-copper and PGE mineralisation.
Drill hole Information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<ul style="list-style-type: none"> No drilling was undertaken

ASX ANNOUNCEMENT

16 March 2022

<p>Data aggregation methods</p>	<ul style="list-style-type: none"> • In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated 	<ul style="list-style-type: none"> • No drilling was undertaken.
<p>Relationship between mineralisation widths and intercept lengths</p>	<ul style="list-style-type: none"> • These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g., 'down hole length, true width not known'). 	<ul style="list-style-type: none"> • No mineralisation widths or intercepts were collected or reported.
<p>Diagrams</p>	<ul style="list-style-type: none"> • Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and sectional views. 	<ul style="list-style-type: none"> • Maps and sections are shown in the document relate to EM survey and geophysical information only.
<p>Balanced reporting</p>	<ul style="list-style-type: none"> • Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> • All data is reported and representative
<p>Other substantive exploration data</p>	<ul style="list-style-type: none"> • Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> • All known and relevant data is reported.
<p>Further work</p>	<ul style="list-style-type: none"> • The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). • Diagrams clearly highlighting the areas of possible extensions, including the • main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<ul style="list-style-type: none"> • Further work will include surface geochemical sampling, ground IP data collection, and drilling once targets have been assessed.
