

## Significant Rare Earth Element (REE) Results Identified at Batemans Project

### Highlights

- Over 2,700 portable XRF (pXRF) readings were acquired over the Batemans Project (EL9146), showing widespread anomalous rare earth elements (REEs).
- Anomalous rare earth results extend along major structures over multiple strike lengths generating a mineralised target area greater than 4 km and up to 800m wide.
- More than 420 pXRF samples returned Total Rare Earth Oxide (TREO) results >500 ppm based on just 5 of the 17 rare earth elements (La, Ce, Pr, Nd and Y).
- High grade rare earth (TREO) results included:
  - 2,218 ppm;
  - 2,193 ppm;
  - 2,061 ppm;
  - 1,497 ppm; and,
  - 1,432 ppm
- Extensive field reconnaissance, including detailed mapping and logging, shows evidence of major sheeted vein systems, extensive alteration zones and large-scale structural controls associated with rare earth elements (REE).
- More than 450 pXRF samples returned silver (Ag) values of 7 g/t or higher.
- Zones of anomalous bismuth (Bi) up to 211 ppm have been identified.
- Zones of anomalous titanium (Ti) up to 1.47% have been identified.
- Assay results are pending and anticipated shortly.
- Ongoing exploration work is being conducted to further determine the potential large scale rare earth, gold and silver mineralisation at the Batemans Project.

Mitre Mining Corporation Limited (ASX: MMC) (Mitre Mining or the 'Company') is pleased to announce that it has achieved significant inroads on the exploration program of work over the Batemans Project (EL9146).

Clinton Carey, Mitre Mining CEO, says, *"The field teams have worked systematically to map and sample the exploration area. The Company has gathered a comprehensive suite of exploration data from which to make more detailed, future exploration decisions. Results to date have shown that the Batemans Project has significant rare earth occurrences and strong silver showings. The next stages of work will further investigate the major structural*

**Figure 1: EL9146 showing Total Rare Earth Oxide (TREO) plots in parts per million (ppm) and association with major alteration and structural (fault) zones.**

Some broad N-S trends associated with higher grade TREO readings within the granodiorites were observed and are considered to support the significant degree of chemical fractionation within the granodiorites.

Silver (Ag) results were also widespread, associated with the major granodiorites, adjacent metasedimentary units, the alteration zones and major fault areas (dilatational zones). The highest result recorded to date was 54 ppm (g/t) and 451 samples returned a silver value of 7 ppm (g/t) or greater (refer to Figure 2).

**Figure 2: EL9146 showing Silver (Ag) plots in ppm (grams per tonne).**

A new portable XRF was acquired by the Company, with the new model having the capacity to detect gold (Au), which will be added to the in-field analytical regime.

Fieldwork by the Company's geological team continued to identify areas of intense, sheeted quartz veining (refer to Figure 3A) characteristic of many reduced intrusion related gold systems (RIRGS) and intense folding (refer to Figure 3B). These are associated with the primary deformation event (D1), responsible for structural control on the emplacement of the granodiorites, which is known to be a critical component of mineralising events in the region.

Figure 3 – A: Sheeted quartz vein arrays within the metasedimentary units reflect the same dilational stresses that controlled emplacement of the granodiorite and represented both early and late-stage fluid flow events that are important for potential mineralisation.

Figure 3 – B: Intense isoclinal folding from the primary deformation event (D1) shows a strong alignment with major fault structures (fluid conduits) along the boundaries of the granodiorites.

The Batemans Project continues to provide evidence for significant rare earth occurrences and strong Silver showings.

The Company has received multiple quotes for detailed radiometric and aeromagnetic survey work over the Batemans Project and is currently reviewing those quotes prior to selecting a preferred service provider. The Batemans Project has only been partially covered by low-resolution geophysical survey work (undertaken by NSW Government). A detailed radiometric and magnetic survey is expected to provide considerable insight into the structural setting and alteration zones (including internal fractionation) which will significantly enhance the next stage of the Company's program of work.

**About Mitre Mining**

Mitre Mining Corporation Limited is an Australian mineral exploration and development company focusing on large scale gold, base metals and lithium discoveries in the eastern Lachlan Fold Belt near Batemans Bay on the New South Wales south coast. The Company holds a 100% interest in EL 9146, The Bateman Project, comprising multiple Reduced Intrusion Gold System (RIRGS) and associated sheeted vein targets; Sn-W skarn targets and pegmatites with potential to host lithium and rare earth elements. The Company also holds

## JORC Code, 2012 Edition – Table

The following table is provided to ensure compliance with the JORC Code (2012 Edition) for the reporting of Exploration Results

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>A portable XRF (pXRF) unit (Olympus Vanta VMR Model) was used for soil and rock chip samples. The pXRF is calibrated with a set of sample standards.</li> <li>Random rock chip samples were collected as part of the geological logging and for complete suite laboratory analysis but have not yet been submitted.</li> <li>All personnel using the pXRF have been through a training program with Olympus and registered on a National Database and operate according to the Company's standard set of procedures to ensure sample representivity.</li> </ul>
<b>Drilling techniques</b>	<ul style="list-style-type: none"> <li>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method)</li> </ul>	<ul style="list-style-type: none"> <li>Not Applicable (NA) – no drilling or associated sampling is being reported.</li> </ul>
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results</li> </ul>	<ul style="list-style-type: none"> <li>Not Applicable (NA) – no drilling or associated sampling is being reported.</li> </ul>
