

## Metallurgical results 74% recovery to 6.2% Li<sub>2</sub>O concentrate

### Highlights Include:

- Very positive first-pass metallurgical testwork with headline recovery of 74% Li<sub>2</sub>O to 6.2% Li<sub>2</sub>O concentrate utilising DMS-Flotation flowsheet
- 50% Li<sub>2</sub>O recovered by DMS (Dense Media Separation) to a 6.08% Li<sub>2</sub>O concentrate
- Low iron impurity of 0.04% Fe<sub>2</sub>O<sub>3</sub> in concentrate
- Additional testwork planned for improvements to recovery and optimisation of flowsheet
- Collection of large scale comprehensive testwork sample +2,500kg nearing completion with PRIMERO Engineering contracted to oversee second phase of testwork

### Sample and Testwork Completed

Red Dirt Metals Limited (ASX: RDT) ("Red Dirt" or the "Company") is pleased to report results from initial sighter testwork completed on a pegmatite sample from the Mt Ida Lithium Project.

The Company submitted approximately 50kg of ½ HQ size drill core sourced from IDDD002 (251.7m-274m) in early December 2021 to carry out a series of sighter metallurgical tests at Nagrom Laboratories Perth. The sample represented a full cross section from the *Sister Sam* pegmatite from the hanging wall through to the footwall contacts.

The testwork flowsheet included HLS (Heavy Liquid Separation) at multiple crush sizes, follow up DMS (Dense Media Separation) and sighter flotation testwork. The head grade of the composite used for testwork was 2.08% Li<sub>2</sub>O, 0.05% Fe<sub>2</sub>O<sub>3</sub> and 250ppm Ta<sub>2</sub>O<sub>5</sub>.

A 30kg subsample of the composite was crushed to P100 3.35mm and wet screened at 0.85mm to produce a P100 3.35mm +0.85mm particle size feed for DMS testwork. For this sample and crush size, 75% of the Li<sub>2</sub>O from the head composite was observed to report to DMS feed. The DMS tests were carried out in two stages using a pilot DMS rig with a 100mm cyclone at sequential SG cut points of 2.7 and 2.95, to separate low density gangue (DMS Tail) and higher density spodumene (DMS Con) respectively. A high percentage 68% of the Li<sub>2</sub>O contained in the DMS feed reported to the SG 2.95 DMS concentrate at a grade of 6.08% Li<sub>2</sub>O and 0.02% Fe<sub>2</sub>O<sub>3</sub>, which represents a positive first pass result.

A weighted composite of the Secondary DMS SG 2.95 float fraction (DMS Mids) and wet screen undersize (-0.85mm) was produced for flotation testwork. The flotation feed composite contained 42% of the Li<sub>2</sub>O from the head composite sample at a grade of 1.50% Li<sub>2</sub>O. This sample was ground to P80 106µm before iron from grinding was removed using Low Intensity Magnetic Separation (LIMS). The sample was then deslimed at 20µm before being subjected to rougher-cleaner mica flotation to reject gangue. The mica rougher tail and mica cleaner tail were then combined and subjected to rougher flotation and 3 stages of cleaner flotation. This generated a flotation concentrate grading 6.50% Li<sub>2</sub>O and 0.08% Fe<sub>2</sub>O<sub>3</sub> with a global recovery of 23% Li<sub>2</sub>O, which is in addition to the DMS recovery giving a 74% Li<sub>2</sub>O recovery in total. Another positive at this early stage is that the iron content in the concentrates produced is very low compared to typical spodumene concentrate iron levels which are preferred to be <1% Fe<sub>2</sub>O<sub>3</sub>.

Table 1; Results of first stage Sighter Testwork for Mt Ida Sister Sam pegmatite and IDDD002 (251.7-274m). ^Higher iron due to iron introduced from abrasion during milling

### **Follow up work**

PRIMERO Engineering has been contracted to oversee the next stage of metallurgical testwork. This testwork phase will incorporate multiple composite samples from up to approximately 2,500kg of feed material sourced from diamond holes currently being completed into the Sister Sam and Timoni pegmatite intrusives. These samples will be used to classify the global pegmatite system, test and develop unit processes within the flowsheet and perform preliminary testing of the mineralogical variability seen throughout the system.

The objective of this sighter metallurgical testwork programme was to perform a first-pass check on the amenability of ore from the Mt Ida Project to DMS and flotation processing. The sample and results presented in this announcement are not considered to be representative of the entire Sister Sam pegmatite or the Mt Ida project as a whole due to the ore being sourced from a single drill hole with comparatively high Li<sub>2</sub>O grade and low Fe<sub>2</sub>O<sub>3</sub> grade.

### **Managing Director Matthew Boyes commented on the sighter metallurgical testwork results;**

*"One of the major risks in any mining project is the quality of the ore and its amenability to utilising standard extraction technology to produce a saleable product. With this first round of sighter testwork RDT has taken a massive step forward in mitigating that risk and demonstrating the Mt Ida pegmatites contain a significant portion of the Lithium bearing Spodumene which is recoverable into a high-quality and high-purity concentrate."*

*"A comprehensive follow up testwork programme designed to better delineate and optimise the DMS and flotation response to our ore will be underway shortly and the results will form an integral part of our PFS and resource estimation work scheduled to commence in Q3 this year."*

Authorised for ASX lodgement by the Board.

### **Mt Ida Mineral Metallurgical Test Work - Competent Person Statement**

The information in this report that relates to metallurgical test work for the Mt Ida Lithium Project has been reviewed by Mr Joshua Paterson who is a member of the Australasian Institute of Mining and Metallurgy. Mr Paterson is an employee of Primero Ltd and has sufficient experience relevant to the style of processing response and type of deposit under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Paterson consents to the inclusion in the report of a summary based upon his information in the form and context in which it appears.

The information in this release that references previously reported exploration results is extracted from the Company's ASX market announcements released on the date noted in the body of the text where that reference appears, or above. The previous market announcements are available to view on the Company's website or on the ASX website ([www.asx.com.au](http://www.asx.com.au)). The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

<b>Audits or reviews</b>	<ul style="list-style-type: none"> <li>None carried out</li> </ul>

## Section 2; Reporting of Exploration Results

Criteria	Commentary
<b>Mineral tenement and land tenure status</b>	<ul style="list-style-type: none"> <li>• Drilling and sampling activities have been carried on M29/2, M29/165 and E29/640</li> <li>• The tenements are in good standing</li> <li>• There are no heritage issues</li> </ul>
<b>Exploration done by other parties</b>	<ul style="list-style-type: none"> <li>• The area has a long history of gold and base metals exploration and mining, with gold being discovered in the district in the 1890s. Numerous generations of exploration have been completed including activities such as drilling, geophysics and geochemical sampling</li> <li>• Targeted Li assaying was first carried out in the early 2000s by La Mancha Resources and more recently, lithium assays were completed by Ora Banda Mining</li> </ul>
<b>Geology</b>	<ul style="list-style-type: none"> <li>• The Mt Ida project is located within the Eastern Goldfields region of Western Australia within the Mt Ida/Ularring greenstone belt</li> <li>• Locally the Kurrajong Antiform dominates the regional structure at Mount Ida, a south-southeast trending, tight isoclinal fold that plunges at a low angle to the south. The Antiform is comprised of a layered greenstone sequence of mafic and ultramafic rocks.</li> <li>• Late stage granitoids and pegmatites intrude the sequence.</li> </ul>
<b>Drill hole Information</b>	<ul style="list-style-type: none"> <li>• A list of the drill hole coordinates, orientations and metrics are provided as an appended table</li> </ul>
<b>Data aggregation methods</b>	<ul style="list-style-type: none"> <li>• No metal equivalents are used</li> </ul>
<b>Relationship between mineralisation widths and intercept lengths</b>	<ul style="list-style-type: none"> <li>• The geometry of the Li mineralisation is currently unknown although preliminary interpretation suggests the pegmatite intrusive sills and bodies are orientated sub-parallel to the Mt Ida Granitic intrusion and the northwest trending amphibolite mafic units which bound the western and eastern limbs of the intrusive</li> </ul>
<b>Diagrams</b>	<ul style="list-style-type: none"> <li>• Figures have been included in the announcement</li> </ul>
<b>Balanced reporting</b>	<ul style="list-style-type: none"> <li>• It is not practical to report all historical exploration results from the Mount Ida Project. Relevant collars and details are contained within the body of the announcement</li> </ul>
<b>Other substantive exploration data</b>	<ul style="list-style-type: none"> <li>• Sighter Metallurgical testwork programme was undertaken on material sourced from 21.7m of mineralised ½ HQ diameter core selected from IDDD002 (251.7-274m) and submitted to Nagrom Laboratories</li> <li>• Testwork include, HLS separation, Comminution, Mag Separation, DMS separation and Flotation testwork to ascertain amenability of the Mt ida pegmatite material to DMS and flotation treatment routes</li> </ul>
<b>Further work</b>	<ul style="list-style-type: none"> <li>• Drilling is continuing at Mt Ida with an initial 25,000m programme consisting of a mix of RC and diamond drilling underway</li> <li>• Aircore and geochemical drilling will also be commenced along strike from the Mt Ida central area with the objective of targeting the pegmatite outcrops located in the mafic sequence sitting to the west of the Mt Ida granitic complex</li> </ul>
