

## SCALE OF NdPr RARE EARTHS TARGET GROWS AT ELPHINSTONE CREEK

Sunshine Gold Limited (ASX:SHN, "Sunshine Gold", "the Company") is pleased to provide an update on recent rare earth element ("REE") soil sampling at the Elphinstone Creek REE-Au prospect, Ravenswood West (Sunshine Gold 100%).

### HIGHLIGHTS

- Assay results from a further 171 soils samples at Elphinstone Creek continue to demonstrate the highly anomalous rare earth nature of the Barrabas Adamellite – a regionally "unique" alkali intrusion.
- Elevated REE from recent soil sampling at Elphinstone Creek include 17 results >1,000 ppm total rare earth oxides ("TREO") with a peak value of 1,327 ppm. The margins of the Adamellite are clearly defined in soils >400 ppm TREO with 30.7% of Adamellite samples exceeding 700 ppm TREO. Pleasingly, the average Neodymium ( $Nd_2O_3$ ) + Praesodymium oxides ( $Pr_6O_{11}$ ) content of TREO is 19.8%.
- Samples have been sent to rare earths specialists at Australian National University for mineralogical characterisation.
- Award of a recent \$34,050 Collaborative Exploration Incentive grant from the Queensland Department of Resources will cover the assay costs of the soils campaign. We acknowledge and appreciate the support of the Queensland Department of Resources.

Figure 1. Geologist Oliver Buchanan sampling.

Sunshine Gold's Managing Director, Damien Keys commented: *"Elphinstone Creek shapes as a significant rare earth system. It is located within a regionally "unique" alkali intrusion that is importantly high in the permanent magnet metals being Neodymium and Praseodymium (which constitute an estimated 90% of global rare earth values). We have engaged rare earth specialists from the Australian National University to expedite our understanding of the mineralogy and nature of the rare earth mineralisation."*

*Soil sampling continues at Elphinstone Creek and is anticipated to have covered the whole of the highly prospective Barrabas Adamellite in July 2022. Furthermore, Elphinstone Creek is located on the southern end of a 15km long corridor of Cu-Au-Ag-Mo and rare earth targets, where drilling is set to recommence once the current rain events subside in late May 2022."*

### NEXT STEPS AT ELPHINSTONE CREEK

The initial soil sampling campaign is scheduled for completion in July 2022. The soils data will be integrated with existing geophysics and mapping to refine targets for drill testing. Samples have been dispatched to rare earth element specialists from the Australian National University to complete a characterisation study on the REE mineralogy and the likely nature of the REE enrichment in the Barrabas Adamellite.

### ELPHINSTONE CREEK

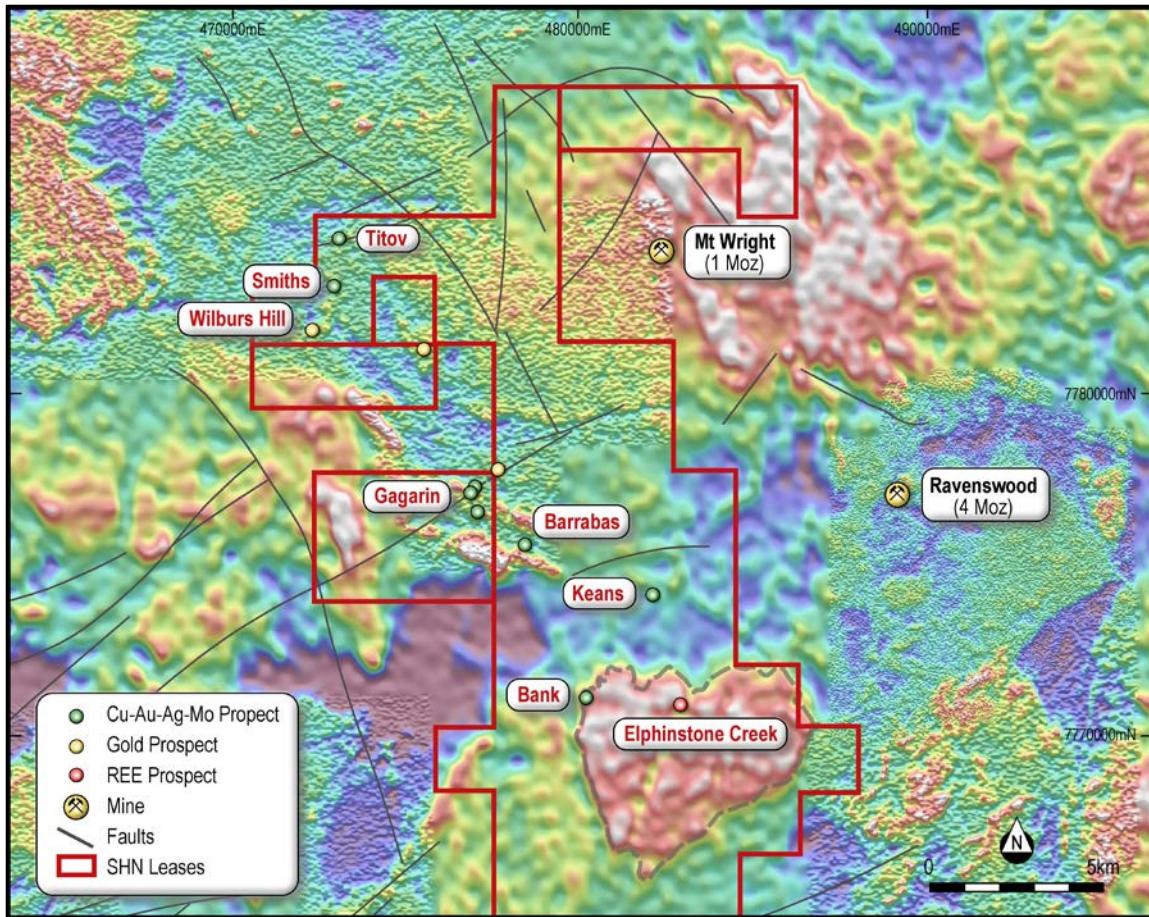

The Elphinstone Creek and Bank Breccia targets are hosted in the Barrabas Adamellite, a quartz monzonite, comprising medium to coarse-grained plagioclase and alkali feldspar (~60%) with lesser quartz (~35%) and biotite (~5%). The Barrabas Adamellite is distinguishable as having broad, moderate magnetics. The Barrabas Adamellite is also highlighted in the radiometrics as having a strong potassium signature (Figure 3).

The prospective Barrabas Adamellite is large-scale and occupies ~27km<sup>2</sup>. To date, assays returned from soil sampling cover only 5.5km<sup>2</sup> (20%) of the area. Soil sampling coverage over the entire Adamellite will be completed in July 2022. Sunshine Gold collected 480 soil samples across the northern margin of the Barrabas Adamellite (Figure 4).

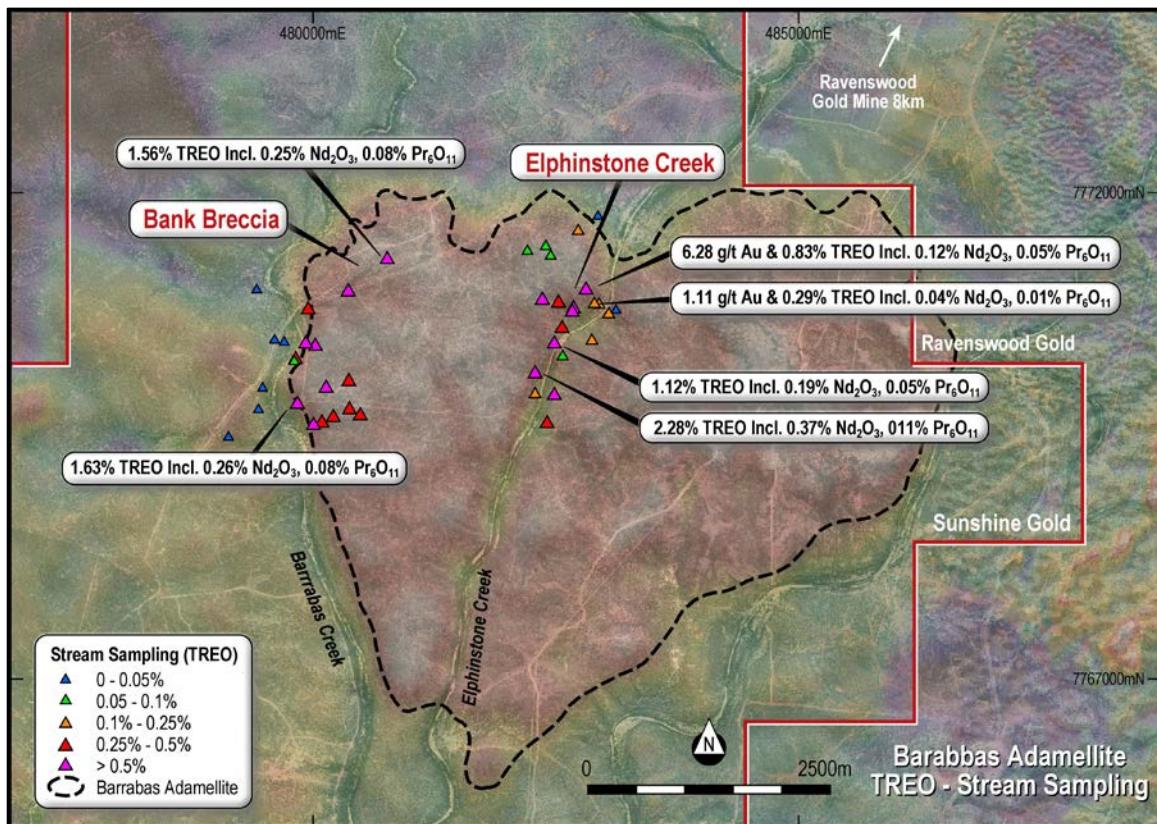

The sampling confirmed that the Barrabas Adamellite is enriched in REE, with all Barrabas Adamellite soil samples grading >400 ppm TREO. A coherent 800m long, ENE striking REE soil anomaly grading (>900 ppm TREO) is observed in the vicinity of the Bank Breccia. The anomaly is supported by elevated stream sediment samples grading up to 1.56% TREO. The anomaly is located immediately east of the historic Bank Breccia drilling.

In addition, a coherent soil anomaly grading >1,000 ppm TREO extends for over 230m in the south of the current survey. Stream sediment sampling from a nearby tributary graded 2.28% TREO including 0.37% Nd<sub>2</sub>O<sub>3</sub>, 0.11 % Pr<sub>6</sub>O<sub>11</sub> (SRS10163). Further REE soil anomalism occurs close to the Adamellite margins on either side of Elphinstone Creek. A peak value of 1,091 ppm TREO (Sample 256157) was recorded immediately east of Elphinstone Creek.

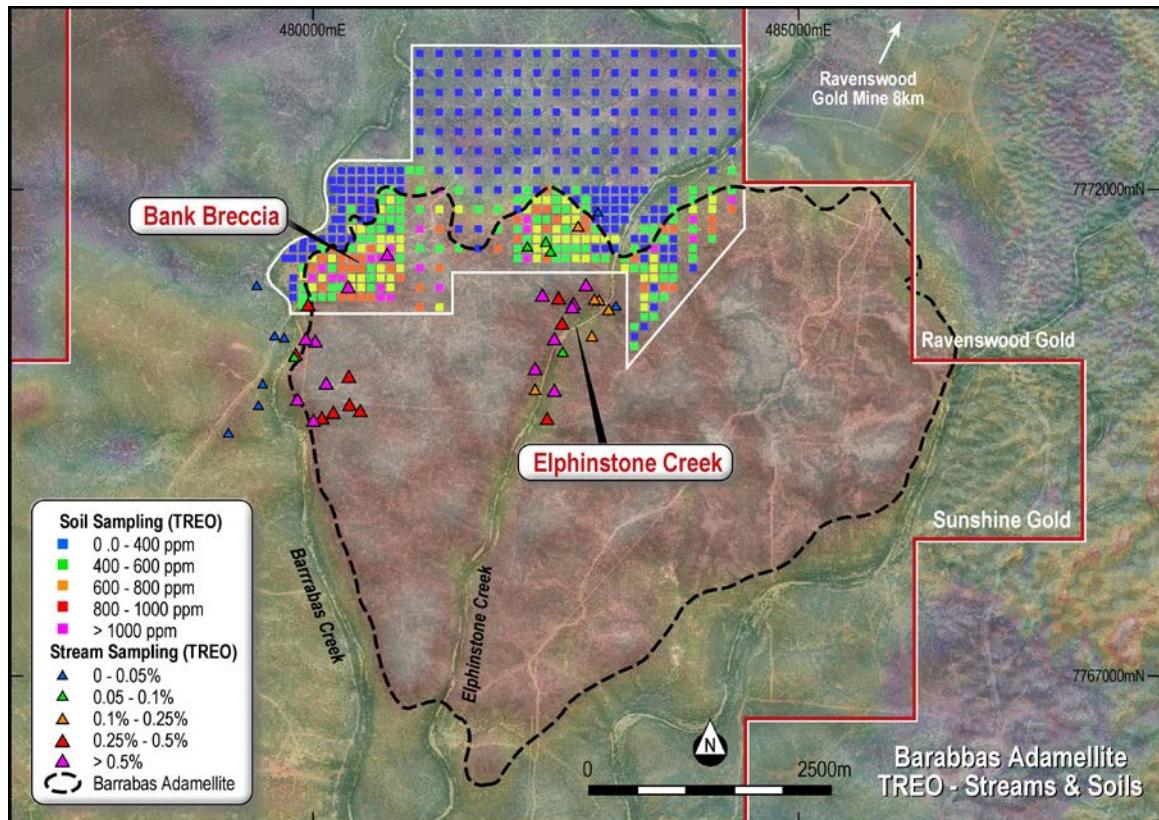

Importantly, the average Neodymium + Praesodymium oxide content of the TREO is 19.8%. Nd+Prare used in permanent magnets and constitute an estimated 90% of global REE value. The soil survey will be extended to the south during 2022 to better refine targets for drill testing.

**Figure 3.** The Barrabas Adamellite (dashed) is also a distinct feature in the potassium radiometrics.

**Figure 4.** Stream sediment sampling locations at the Barrabas Adamellite over potassium radiometrics and air photo.

**Figure 5. TREO distribution in soils. Only 20% of the Barabbas Adamellite has been sampled to date with the remaining 80% to be sampled in 2022.**

## PLANNED ACTIVITIES

- May 2022: Triumph metallurgical Test work results
- June 2022: IP/MT survey Wilburs Hill – Smiths, Ravenswood West
- June 2022: RC drilling, Titov & the Bank, Ravenswood West
- June 2022: Gagarin IP Survey, Ravenswood West
- June 14-15, 2022: Australian Gold Conference, Sydney
- June 23-24, 2022: RIU Investment Showcase Conference, Gold Coast
- July 2022: Electromagnetic & magnetic geophysical survey, Investigator
- July 20-22, 2022: Noosa Mining Conference
- July 2022: Quarterly Report

## ABOUT RARE EARTH ELEMENTS

The unique chemical and physical properties of REEs have positioned them as a critical material across a number of rapidly evolving markets and industrial applications.

NdPr constitutes ~90% of global REE value.

NdPr are critical elements in the manufacture of permanent magnets used for motors, turbines and in mobile phones. Permanent magnet production accounts for ~90% of the total value of TREO consumption. Permanent magnets and catalysts are the largest, rare earth demand drivers.

Key global megatrends are driving strong and diversified demand for NdPr:

- Automation: accelerating technological progress
- Low carbon transition: environmental decarbonisation
- Sustainable resource security: increasing scarcity of and global competition for resources
- Supply chain security: against backdrop of heightened national protectionism

There are currently no acceptable substitutes for NdPr in permanent magnets for electric vehicles (EVs) and wind turbines.

### *Competent Person's Statement*

*The information in this report that relates to Exploration Results is based on, and fairly represents, information compiled by Dr Damien Keys, a Competent Person who is a Member of the Australian Institute of Geoscientists (AIG). Dr Keys has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the JORC Code. Dr Keys consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.*

## **ABOUT SUNSHINE GOLD**

Sunshine Gold is focused on its high-quality gold and copper projects in Queensland comprising a 100% interest in the Triumph, Hodgkinson, Investigator and Ravenswood West projects.

### ***Ravenswood West Gold-Copper-Rare Earth Project***

**(EPM 26041, EPM 26152, EPM 26303, EPM 26304, EPM 27824, EPM 27825: 100%)**

Ravenswood West is comprised of a significant holding (392 km<sup>2</sup>) of highly prospective gold-copper ground within 5 kms of the Ravenswood Mining Centre (4 Moz Au produced, a further 4.3 Moz Au in Resource and 1.8 Moz in Ore Reserves). The Ravenswood Mining Centre was purchased by EMR Capital and Golden Energy & Resources Ltd. (SGX:AUE) in 2020 for up to \$300m and is presently subject to a ~\$200m upgrade. In addition, there are three other gold mills within 100 km, two of which are toll treating.

The Project is highly prospective for intrusion-related and orogenic gold, porphyry gold-copper-molybdenum and rare earth elements. Ravenswood West covers 20-25 km of strike along a major fault that links Pajingo (4 Moz) and Ravenswood (9.8 Moz) and contains numerous historic gold workings.

### ***Triumph Gold Project (EPM18486, EPM19343: 100%)***

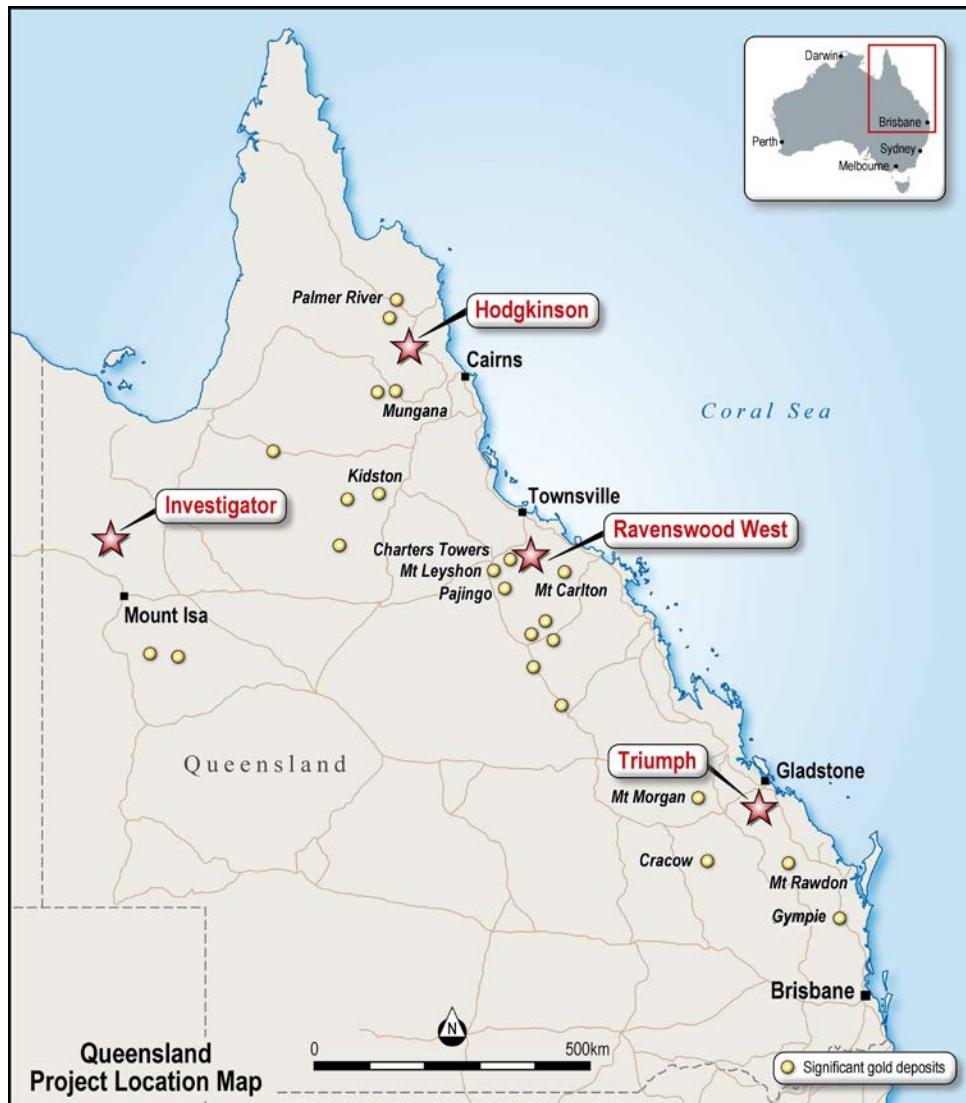

Triumph is centred around the historical Norton gold field from which ~20,000 oz of gold was extracted between 1879-1941. The project is located 50km south of the mining hub of Gladstone and comprises tenements covering 138km<sup>2</sup>. Triumph is located within the Wandilla Province of the New England Orogen. Nearby large gold deposits include Mt Rawdon (2.8 Moz Au), Mt Morgan (8 Moz Au and 0.4 Mt Cu) and Cracow (2 Moz Au). Triumph is a 15km<sup>2</sup> intrusion related gold system which has the potential to host both discrete high-grade vein deposits and large-scale, shear hosted gold deposits.

### ***Hodgkinson Gold Copper Project (EPM18171, EPM19809, EPM25139, EPM27539, EPM27574, EPM27575: 100%)***

Hodgkinson is located 100km north east of Cairns in North Queensland. The project comprises tenements covering 365km<sup>2</sup>. The project is situated between the Palmer River alluvial gold field (1.35 Moz Au) and the historic Hodgkinson gold field (0.3 Moz Au) and incorporates the Elephant Creek Gold, Peninsula Gold-Copper and Campbell Creek Gold prospects. Hodgkinson has been extensively explored for tungsten, owing to its proximity to the Watershed and Mt Carbine tungsten deposits, but underexplored for gold. BHP-Utah International completed stream sediment sampling across the project in the late 1980's and confirmed that the area was anomalous in gold as well as tungsten.

### ***Investigator Copper Project (EPM27344, EPM27345: 100%)***

Investigator comprises tenements covering 115km<sup>2</sup>. It is located 110km north of Mt Isa and 12km south of the Mt Gordon Copper Mine. Investigator has seen no modern exploration and importantly, no holes have been drilled in the most prospective stratigraphic and structural positions.

## JORC Code, 2012 Edition TABLE 1

Section 1 Sampling Techniques and Data (Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>• Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>• Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>• Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<p><b>Historical Drilling:</b></p> <p><b>Stavely Minerals</b> – Sulphide bearing intervals were sampled as half core and submitted to laboratory for analysis. Sample intervals were based on lithology and typically 1m length, with no intervals smaller than 0.4m and none larger than 1.2m.</p> <p><b>Rock Chip Sampling:</b></p> <p><b>BHP Exploration</b> – Sampling methodology unknown</p> <p><b>Stream Sediment Samples:</b></p> <p><b>BHP Exploration</b> – Stream sediments were collected as -2mm BLEG samples with -80 mesh samples also collected for re-assay if required.</p> <p><b>Stavely Minerals</b> – The stream sediment samples were taken from a reasonably straight section of the stream away from turbulent flow. The surface sand was removed and a sample was taken from a depth of between 5 and 20cm. The sample was sieved with a 4mm mesh to remove the larger fraction and placed in labelled calico bags. Sample preparation was completed by Stavely Minerals' personnel. Preparation involved mechanical sieving using a -80 mesh sieve stack to produce an &gt; 100g sample, which was weighed on a digital kitchen scale and was subsequently placed in a corresponding numbered brown paper geochem bag. Damp samples were sun dried prior to sieving. The fines were submitted to ALS Laboratory in Townsville.</p> <p><b>Soil Samples</b></p> <p><b>Stavely Minerals</b> – Soils were collected from the B-Horizon and sieved to -2mm using a coarse mesh. This was placed in a ziplock bag and subsequently sieved again to -80mesh out of field by Stavely personnel and placed in corresponding paper geochem bags, of weight 100 – 150g.</p> <p><b>Sunshine Gold</b> – Samples were collected from between 5 – 15cm below existing surface and sieved to -80 mesh size. A sampling pick is used to remove the top 5cm of vegetation and dirt (A-Horizon) and then a roughly 40cm x 40cm sized hole is dug and turned over. The dirt is sieved to -80 mesh and approximately 100g of sample is placed within a numbered paper bag. The samples were transported by SHN to the laboratory for assay.</p>

Criteria	JORC Code explanation	Commentary
<b>Drilling techniques</b>	<ul style="list-style-type: none"> <li>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</li> </ul>	<p><b>Historical Drilling:</b></p> <p><b>Stavely Minerals</b> – Holes collared in PQ and completed in HQ size. Standard tube. Core was orientated using Reflex ACT III orientation tool.</p>
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<p><b>Historical Drilling:</b></p> <p><b>Stavely Minerals</b> – Core recoveries are recorded in the database, with holes reportedly returning excellent recovery throughout. Diamond core is reconstructed into continuous runs on an angle iron cradle for orientation markings. Depths are checked against the depth given on the core blocks and rod counts are routinely carried out by the driller.</p>
<b>Logging</b>	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<p><b>Historical Drilling:</b></p> <p><b>Stavely Minerals</b> – Geological logging of samples following Company and industry common practice. Qualitative logging of samples including (but not limited to); lithology, mineralogy, alteration, veining and weathering. Diamond core logging included additional fields such as structure and geotechnical parameters.</p> <p>Magnetic Susceptibility measurements were taken for each 1m diamond core interval. All logging is quantitative, based on visual field estimates. Systematic photography of the diamond core in the wet and dry form was completed.</p> <p><b>Rock Chip Sampling:</b></p> <p><b>BHP Exploration</b> – No record of rock-chip description for sample BKR-060, although some rocks collected at the same time were described.</p> <p><b>Historical Streams &amp; Soils:</b></p> <p>Partial logging was undertaken to record substrate</p> <p><b>Sunshine Gold</b> – No geological information has been logged whilst directly taking the soil sample. All samples are ensured they are not collected on top of infrastructure (e.g. historical workings) or from alluvial sources (e.g. creeks).</p>
<b>Sub- sampling techniques, sample preparation</b>	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</li> </ul>	<p><b>Historical Drilling:</b></p> <p><b>Stavely Minerals</b> – The half core for the HQ diameter was sampled at Terra Search's yard in Townsville, Queensland. The sample sizes are considered to be appropriate to correctly represent the sought</p>

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	mineralisation.  <b>Rock Chip Sampling:</b> <b>BHP Exploration</b> – Sampling methodology unknown  <b>Stream Sediments:</b> <b>BHP Exploration</b> – BLEG samples sieved to -2mm were taken, as well as corresponding -80mesh samples. The BLEG samples were sent to the laboratory, with follow up using the -80 mesh is required. <b>Stavely Minerals</b> – Approximately 100 – 150g of -80mesh sample was collected. The sample sizes are considered to be appropriate to correctly represent the sought mineralisation.  <b>Soil Sampling:</b> <b>Stavely Minerals</b> – Approximately 100 – 150g of -80mesh sample was collected. The sample sizes are considered to be appropriate to correctly represent the sought mineralisation. <b>Sunshine Gold</b> – Approximately 100g of -80 mesh sample is collected. This is deemed representative of the B-Horizon soil as a point location. Laboratory in-house QAQC protocols are solely used.
<b>Quality of data and laboratory tests</b>	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc..</li> <li>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</li> </ul>	<b>Historical Drilling:</b> <b>Stavely Minerals</b> – The core samples were analysed by multielement ICPAES Analysis – Method ME-ICP61. The core samples were also analysed for gold using a 30g fire assay. Laboratory QAQC involved the submission of standards and blanks. For each 20 samples, either a Certified Reference Material (CRM) standard or a blank was submitted. The analytical laboratory also provide their own routine quality controls within their own practices. The results from their own validations were provided to Stavely Minerals. Results from the CRM standards and the blanks gives confidence in the accuracy and precision of the assay data returned from ALS. <b>Rock Chip Sampling:</b> <b>BHP Exploration</b> – No methodologies are reported, but soils and stream samples at the same time used 2 to 3 acid digest with ICP-OES finish on for multi-element, including REEs.

Criteria	JORC Code explanation	Commentary
		<p><b>Stream Sediment Samples:</b></p> <p><b>BHP Exploration</b> – Stream sediment samples of -2mm size were analysed for Au by active cyanide solvent extraction, carbon rod finish. This is a partial extraction technique. Some of these were followed up by using 2 to 3 acid digest with ICP-OES finish on select samples for multi-element, including REEs.</p> <p><b>Stavely Minerals</b> – The sieved -80 mesh stream sediment samples were analysed for gold by using an aqua regia extraction and ICP-MS finish. The determination of gold by aqua regia digest offers very low detection limits, making it an attractive option for soil and stream sediment sampling surveys. Multi-element data, including REEs, were assayed by four-acid digest and ICP-MS finish. Only internal laboratory QAQC was applied.</p> <p><b>Soil Sampling:</b></p> <p><b>Stavely Minerals</b> – The sieved -80 mesh samples were analysed for gold by using an aqua regia extraction and ICP-MS finish. The determination of gold by aqua regia digest offers very low detection limits, making it an attractive option for soil and stream sediment sampling surveys. Multi-element data, including REEs, were assayed by four-acid digest and ICP-MS finish. Only internal laboratory QAQC was applied.</p> <p><b>Sunshine Gold</b> – Soils were assayed using a 25g fire assay with ICP-AES finish, which is considered appropriate for this style of mineralisation. Fire assay is considered total assay for gold. All other elements, including REEs, were assayed using ICP-MS.</p>
<b>Verification of sampling and assaying</b>	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>Discuss any adjustment to assay data.</li> </ul>	<p><b>Historical Drilling:</b></p> <p>Historical data is reported as per the open file or ASX reports. No twinned holes are available for direct correlation to drill hole. Primary assay data is available for the Stavely Minerals. No conversions on assays have been undertaken here.</p> <p><b>Soil and Stream Sediment Sampling:</b></p> <p>Samples will be collected by SHN near historical data and will be compared in due course. However, both Stavely Minerals and Sunshine Gold samples confirm anomalous within the boundaries of the Barrabas Adamellite.</p> <p>REE assays have been converted to their economic oxide</p>

<b>Location of data points</b>	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>	<p><b>Historical:</b></p> <p><b>BHP</b> data was recorded in AGD84, Zone 55.</p> <p><b>Stavely Minerals</b> – The grid system used by Stavely Minerals was GDA94, Zone 55.</p> <p><b>Sunshine Gold</b> – Samples are located as points using handheld GPS in GDA94, Zone 55 format.</p>																																																												
<b>Data Spacing and distribution</b>	<ul style="list-style-type: none"> <li>Data spacing for reporting of Exploration Results.</li> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>Whether sample compositing has been applied.</li> </ul>	<p><b>Historical Drilling:</b></p> <p>Historical drill holes were exploration holes only and therefore did not have a set spacing. The holes were considered appropriately located for the target.</p> <p>Sample intervals were based on lithology but in general were 1m. No intervals were less than 0.4m or greater than 1.2m.</p> <p><b>Rock Chip Sampling:</b></p> <p><b>BHP Exploration</b> – No spacing due to the nature of the sampling method.</p> <p><b>Stream Sediments:</b></p> <p><b>BHP Exploration</b> – Typically took 1 sample within 1.5km of stream</p> <p><b>Stavely Minerals</b> – Due to the nature of the sampling method, no specific spacing is recorded and can vary between 30m to over 300m.</p>																																																												

Criteria	JORC Code explanation	Commentary
		<p><b>Soil Sampling:</b></p> <p><b>Stavely Minerals</b> – A nominal 100m x 100m grid was used over the Bank area.</p> <p><b>Sunshine Gold</b> – A nominal 200m x 200m grid was used on the edges of the sample area, closing to 100m x 100m in the core of the grid.</p>
<b>Orientation of data in relation to geological structure</b>	<ul style="list-style-type: none"> <li>• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>• If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<p><b>Historical Drilling:</b></p> <p><b>Stavely Minerals</b> – At the Bank Breccia, diamond drill hole SRD002 was oriented at -60° towards 130° magnetic azimuth to intercept the breccia. The hole was reportedly positioned to test at depth rock chip samples which returned up to 0.25 g/t Au and 45.7 g/t Ag, which are coincident with a Ag-Sb-As-Cu-Bi soil anomaly.</p> <p><b>Stream Sediment Sampling:</b></p> <p>Sample locations are limited by stream location.</p> <p><b>Soil Sampling:</b></p> <p><b>Stavely Minerals</b> – The soil sampling grid was not orientated (100m by 100m sampling) and is considered to have achieved unbiased sampling.</p> <p><b>Sunshine Gold</b> – An evenly spaced, unbiased N – S 100m x 100m grid is used to cover the Barrabas Adamellite in order to assist in distinguishing any mineralised orientations within the core of the unit.</p>
<b>Sample security</b>	<ul style="list-style-type: none"> <li>• The measures taken to ensure sample security.</li> </ul>	<p><b>Historical Drilling:</b></p> <p><b>Stavely Minerals</b> – Samples were hand delivered in closed poly-weave bags by Terra Search contractors to the ALS laboratory in Townsville. At the laboratory the samples are stored in a locked yard before being processed and tracked through preparation and analysis.</p> <p><b>Rock Chips, Stream Sediment Samples and Soil Samples:</b></p> <p><b>BHP Exploration</b> – It is not known how samples were stored or transported.</p> <p><b>Stavely Minerals</b> – The brown paper geochem sample bags containing the sieved stream sediment samples were packaged in a sealed cardboard box for hand delivery to ALS in Townsville, Queensland.</p> <p><b>Sunshine Gold</b> – Samples were pre-numbered prior to collection. Samples are sieved when collected and placed</p>

Criteria	JORC Code explanation	Commentary
		immediately into a paper geochemical bag marked with the sample ID. The paper bags are then placed in boxes or calicos with a numbered range. The samples are then transported by SHN to the laboratory. No third party was involved with the handling of the sample between collection and drop off.
<b>Audits or reviews</b>	<ul style="list-style-type: none"> <li>The results of any audits or reviews of sampling techniques and data.</li> </ul>	<p><b>Historical Datasets</b> – Sampling techniques and data are considered standard for the time at which they were collected. As with all historical datasets, there is an acknowledged gap in the available information and as such should be treated with caution.</p> <p><b>Sunshine Gold</b> – The sampling techniques are regularly reviewed during the program and further review will take place prior to future drilling. No external audits have been undertaken.</p>

## Section 2 – Reporting of Exploration Results (Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<b>Mineral tenement and land tenure status</b>	<ul style="list-style-type: none"> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<p>The Ravenswood West Project consists of EPMs 26041, 26152, 26303, 26404, 27824 and 27825. All EPMs are owned 100% by Ukalunda Pty Ltd and XXXX Gold Pty Ltd, both wholly owned subsidiaries of Sunshine Gold Limited. The tenements are in good standing and no known impediments exist.</p> <p>Two current, third party Mining Leases exist on EPM 26041 – named ML 10243 (Delour) and ML 10315 (Podosky). One further current, third party Mining Lease exists partially on EPM 26152 – named ML 1529 (Waterloo).</p> <p>All of EPM 26303 and part of EPM 26041 are situated within the Burdekin Falls Dam catchment area.</p>

Criteria	JORC Code explanation	Commentary																
<b>Exploration done by other parties</b>	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<p>Numerous exploration companies have explored within the Ravenswood West Project area, namely North Broken Hill, New Consolidated Gold Fields, Noranda, Planet Metals, MAT, Nickel Mines Ltd, Minefields, Kennecott, Cormepar Minerals, Geopeko, Esso, Dampier Mining, IMC, CRA, Ravenswood Resources, Dalrymple Resource, BJ Hallt, Poseidon, Haoma Mining, Kitchener Mining, Placer, Goldfields, Carpentaria Gold, MIM, BHP, and Stavely Minerals.</p>																
<b>Geology</b>	<ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul>	<p>The Ravenswood West Project area is located within open file 100k map sheet area 8257.</p> <p>The project is hosted within the Ravenswood Batholith of the Charters Towers Province, which consists primarily of Ordovician to Silurian granitoids and lesser sedimentary packages. The area is considered by SHN to be prospective for orogenic and intrusion-related gold deposits, as well as granitoid-related copper, molybdenum, silver and rare earth deposits. There also appears to be prospectivity for MVT deposits on the fringes of the tenement area.</p>																
<b>Drill hole information</b>	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> <li>easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and intercept depth</li> </ul> </li> <li>hole length.</li> </ul>	<p><b>Stavely Minerals drill hole SRD002:</b></p> <table border="1" data-bbox="842 1321 1334 1620"> <tbody> <tr> <td>Hole ID</td> <td>SRD002</td> </tr> <tr> <td>Depth</td> <td>420.7</td> </tr> <tr> <td>Grid ID</td> <td>MGA94, Zone 55</td> </tr> <tr> <td>East</td> <td>480,045</td> </tr> <tr> <td>North</td> <td>7,771,233</td> </tr> <tr> <td>RL</td> <td>210</td> </tr> <tr> <td>Dip</td> <td>-60</td> </tr> <tr> <td>Azimuth (Grid)</td> <td>144.7</td> </tr> </tbody> </table>	Hole ID	SRD002	Depth	420.7	Grid ID	MGA94, Zone 55	East	480,045	North	7,771,233	RL	210	Dip	-60	Azimuth (Grid)	144.7
