Diamond Drilling Assays
31.9m @ 1.01% Li_2O

Red Dirt Metals Limited (ASX: RDT) ("Red Dirt" or the "Company") is pleased to provide an update on the latest batch of assays received from three diamond holes at its Mt Ida Lithium Gold Project. These results include the first diamond hole returned from the Timoni pegmatite with exceptional grades reported across the pegmatite interval.

Highlights include;

"Sister Sam" Pegmatite;

- ***31.9m @ 1.01% Li_2O*** *intersected in IDRCD204 from 367m*
  - ***including 8m @ 1.90% Li_2O*** *from 378m*
- ***26.3m @ 1.1% Li_2O*** *intersected in IDRCD172 from 299.9m*
  - ***including 3.5m @ 2.4% Li_2O*** *from 300.4m*

"Timoni" Pegmatite interval in first diamond hole;

- ***5.2m @ 2.42% Li_2O*** *intersected in IDRCD153 from 275.6m*
- *4 drill rigs now onsite completing expanded 60,000m programme*
- *Resource definition drilling on target for completion by end Q2 2022*

Drilling at the southern Sister Sam and Timoni Pegmatite has again reported exceptional grades of Li_2O over significant thicknesses. The first Timoni core from IDRCD153 intersected ***5.2m @ 2.42% Li_2O*** from 275.6m downhole with high contents of visible coarse spodumene crystals in the submitted core.

The Timoni pegmatite remains open at depth with IDRD006 intersecting 14.95m of pegmatite core from 404m downhole approximately 120m further down plunge from IDRCD153 (assays pending). This is indicating that the pegmatite is thickening with depth. Sister Sam drilling will now focus on the delineation of the shallower portion of the pegmatite body between 200m and 40m from surface for both metallurgical and resource definition purposes.

With a 4th drill rig now having arrived at site, and further rig (1 Aircore) planned to arrive by the end of May, the Company is advancing the resource drill-out and regional exploration programmes as quickly as practicable. Red Dirt is continuing its aggressive approach to exploration and development with an additional 60,000m of drilling now approved in addition to the 28,000m already completed at the project since November 2021.

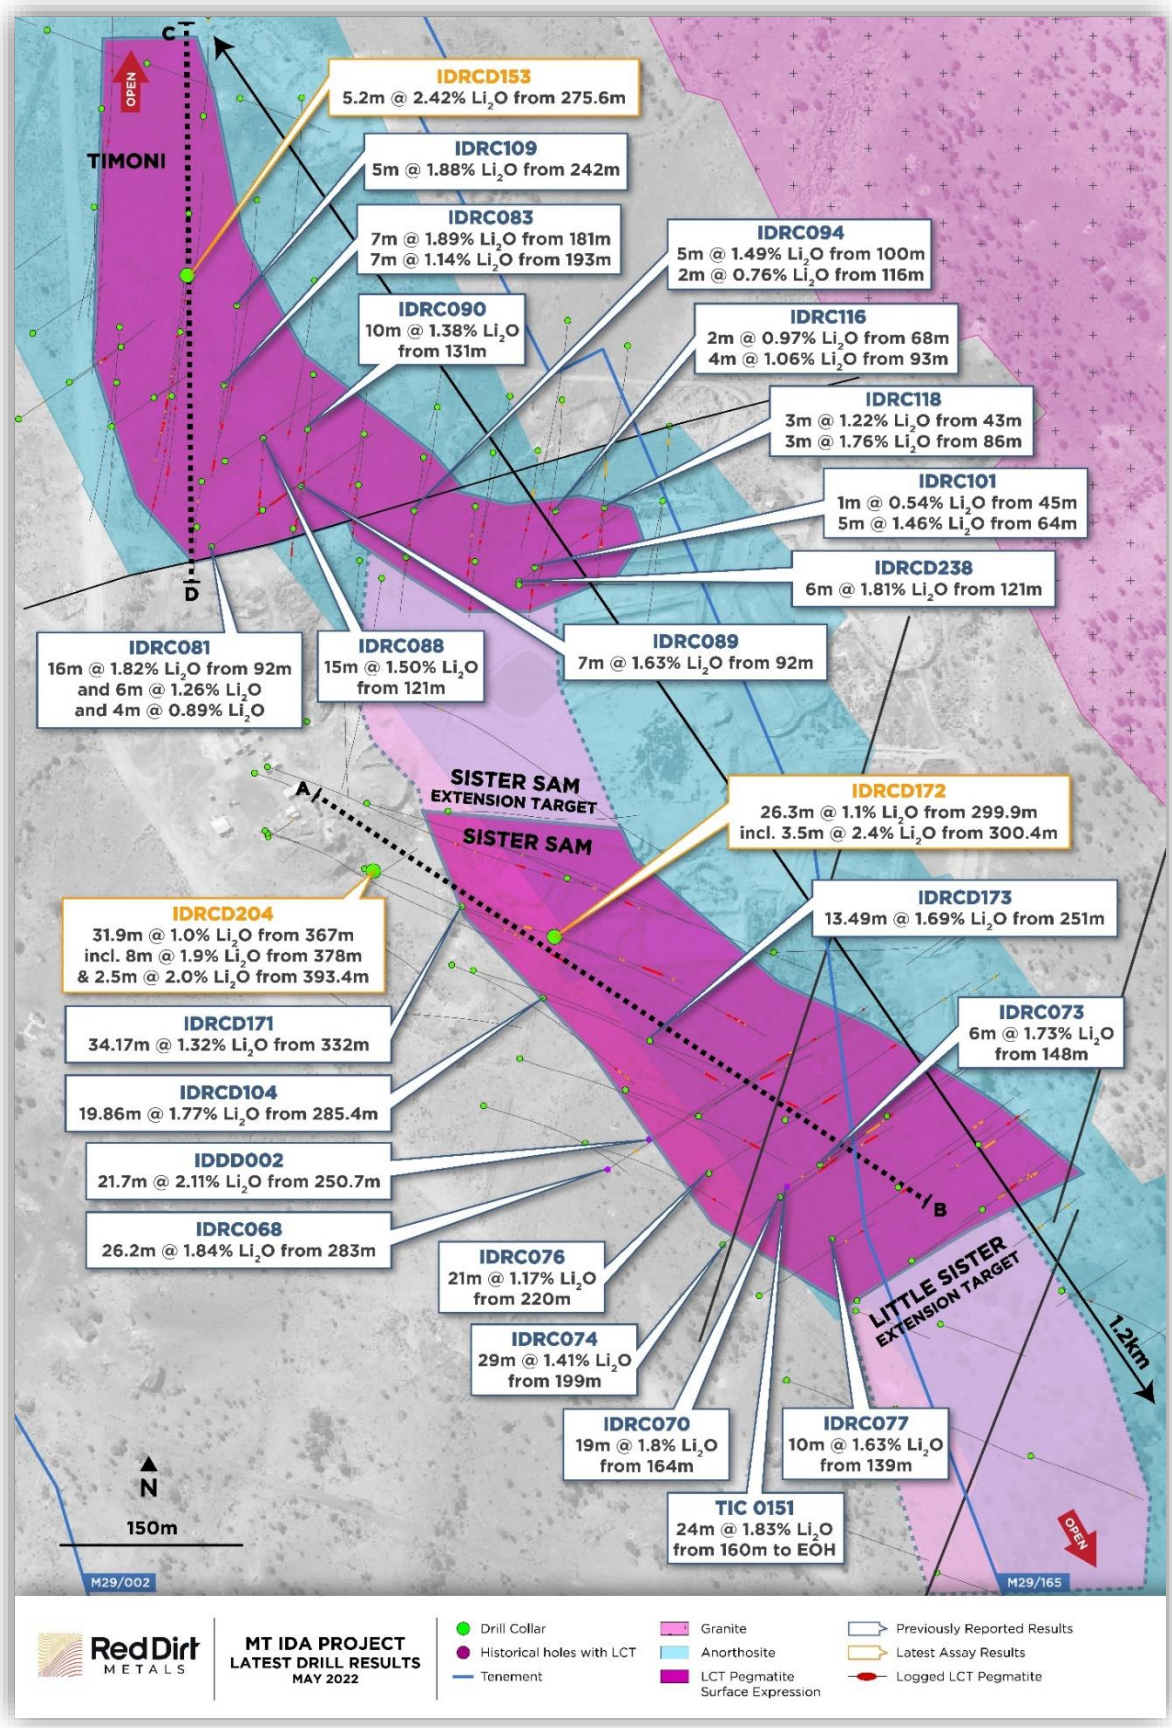

Figure 1; Planview of the Mt Ida pegmatites modelled and extrapolated to surface with significant Li_2O intervals

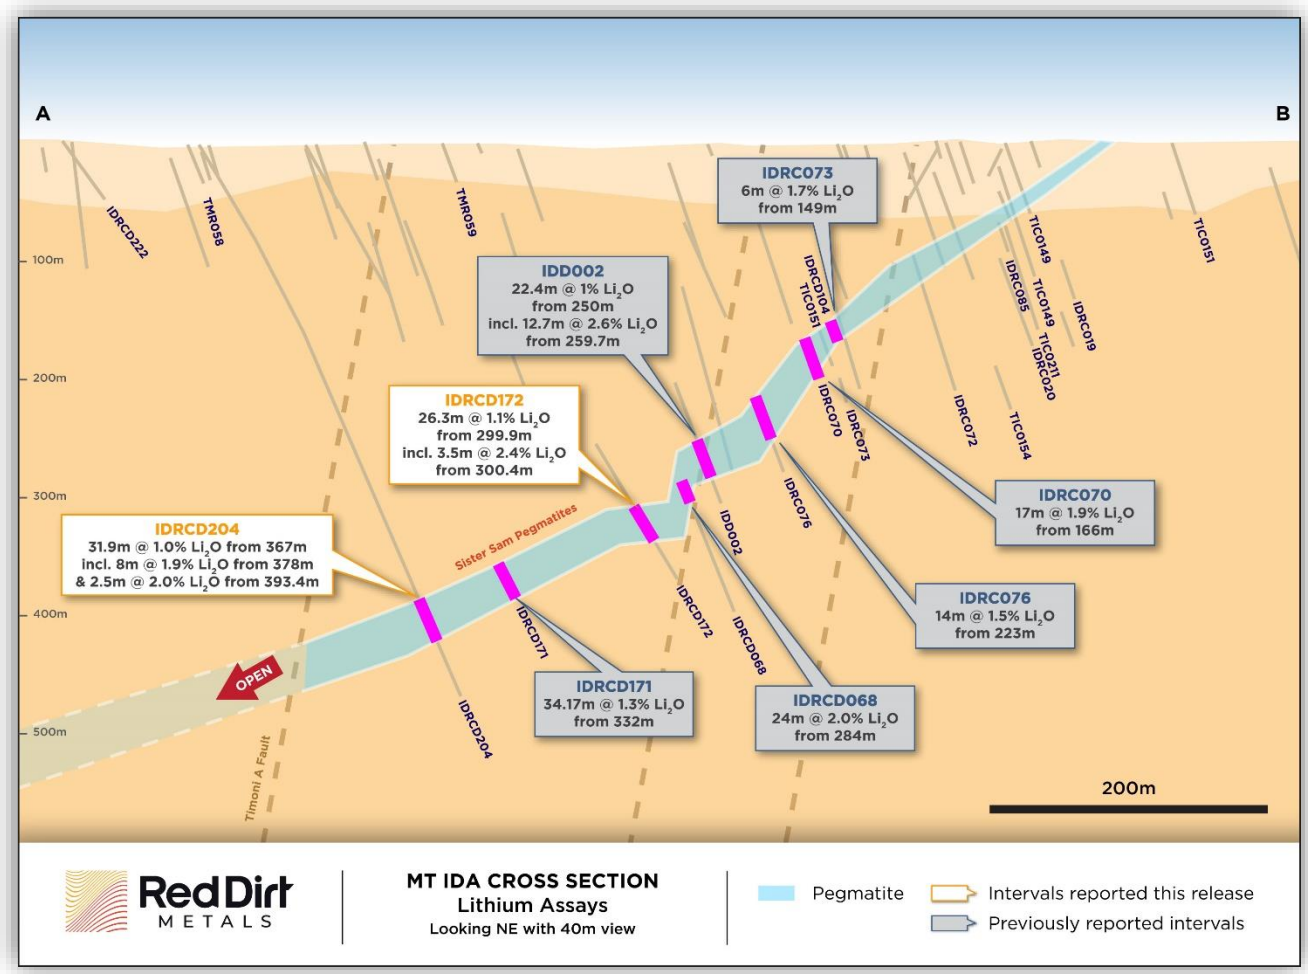

Figure 2; Section through Sister Sam pegmatite showing Li_2O grades reported to date with additional new intervals

After receiving very positive first round sighter testwork results (ASX release 4th May 2022), the collection of a 2.5 tonne representative metallurgical sample for the feasibility level metallurgical testwork programme is ongoing in conjunction with resource definition drilling targeted for completion by end of June 2022. Red Dirt is currently applying a 30th June cut-off date for the last drilling to be submitted for analysis and to be included into a maiden resource estimation.

The Company has an independent consulting group contracted to calculate and report the maiden resource estimate for the Sister Sam, Timoni and Sparrow pegmatites. In addition to the Lithium resource will be a review, re-calculation and report on an updated JORC 2012 resource of the existing gold-copper mineralisation at Mt Ida, as these resources are currently calculated under JORC 2004 and require updating for compliance purposes.

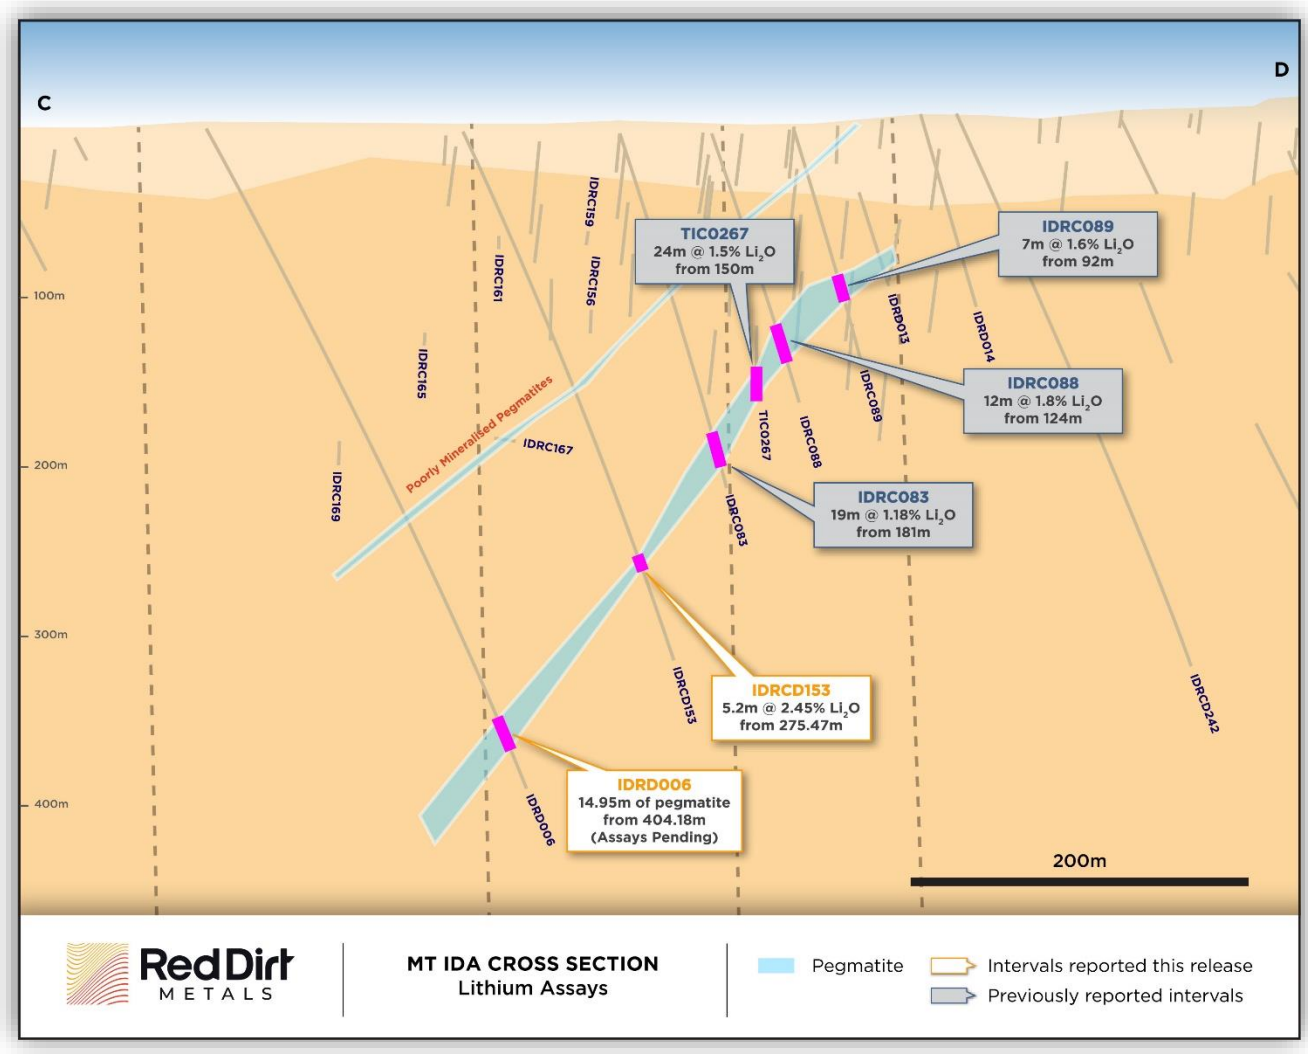

Figure 3; Timoni section with pegmatite outline and updated lithium assays

Managing Director Matthew Boyes commented on updated Drill results from Mt Ida;

"An excellent result again from the diamond core assays especially now with Timoni pegmatite also reporting very high-grade Lithium results over good widths. We've seen a steady increase in drill metre production rates with another two machines now onsite and we are on target for the completion of our resource definition drill out by the end of June 2022. I see the calculation of this resource estimate as our next major de-risking hurdle in the development of the Mt Ida Lithium project."

Authorised for ASX lodgement by the Board.

Competent Persons Statement

Exploration information in this Announcement is based upon work undertaken by Mr Matthew Boyes who is a Fellow of the Australasian Institute of Mining and Metallurgy (AUSIMM). Mr Boyes has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a 'Competent Person' as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (JORC Code). Mr Boyes is an employee of Red Dirt Metals Limited and consents to the inclusion in the report of the matters based on their information in the form and context in which it appears.

The information in this release that references previously reported exploration results is extracted from the Company's ASX market announcements released on the date noted in the body of the text where that reference appears, or above. The previous market announcements are available to view on the Company's website or on the ASX website (www. asx.com.au). The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

Criteria	Commentary
Sampling techniques	**Red Dirt Metals** • Sampling activities have included reverse circulation (RC) and diamond (DD) drilling, and rock chip sampling at the Mt Ida project. Core sampling of one hostorical drillhole has also been carried out, with assaying, petrological and XRD analysis completed • RC are samples collected from a static cone splitter mounted directly below the cyclone on the rig • DD core has not yet been processed **Hostorical Data** • Limited hostorical data has been supplied, hostorical sampling referenced has been carried out by Hammill Resources, International Goldfields, La Mancha Resources, Eastern Goldfields and Ora Banda Mining, and has included rock chip sampling, and RC, DD and rotary air blast (RAB) drilling • Sampling of hostorical RC has been carried out via riffle split for 1m sampling, and scoop or spear sampling for 4m composites, hostorical RAB drilling was sampled via spear into 4m composites • Hostorical core has been cut and sampled to geological intervals • These methods of sampling are considered to be appropriate for this style of exploration
Drilling techniques	**Red Dirt Metals** • Drilling is being carried out by Orlando Drilling, RC drilling is utilising an Explorac 220RC rig with a 143 mm face sampling hammer bit and DD drilling is carried out by a truck mounted Sandvik DE820 and a KWL 1500 and is HQ2 and NQ2 diameter • Diamond tails average 200m depth **Hostorical Data** • Hostorical drilling has been completed by various companies including Kennedy Drilling, Wallis Drilling, Ausdrill and unnamed contractors utilising purpose-built RAB, RC and DD rigs as well as combination rigs • Hostorical DD drilling was NQ sized core • It is assumed industry standard drilling methods and equipment were utilised for all hostorical drilling
Drill sample recovery	**Red Dirt Metals** • Sample condition is recorded for every RC drill metre including noting the presence of water or minimal sample return, inspections of rigs is carried out daily • Recovery on diamond core is recorded by measuring the core meter by meter **Hostorical Data** • Limited sample recovery and condition information has been supplied or found
Logging	**Red Dirt Metals** • Quantitative and qualitative geological logging of drillholes adheres to company policy and includes lithology, mineralogy, alteration, veining and weathering • Diamond core logging records lithology, mineralogy, alteration, weathering, veining, RQD, SG and structural data is recorded • All chip trays and drill core are photographed in full **Hostorical Data** • A complete quantitative and qualitative logging suite was supplied for

Criteria	Commentary
	hostorical drilling including lithology, alteration, mineralogy, veining, weathering • It is unknown if all hostorical core was oriented, limited geotechnical logging has been supplied • No hostorical core or chip photography has been supplied • Logging is of a level suitable to support Mineral resource estimates and subsequent mining studies
Sub-sampling techniques and sample preparation	**Red Dirt Metals** • DD sampling is undertaken by lithology/alteration domain to a maximum of 1.1m and a minimum of 0.3m. Core is cut in half with one half sent to the lab and one half retained in the core tray. • RC samples are collected from a static cone splitter mounted directly below the cyclone on the rig, sample weights are kept under 3kg to ensure total inclusion at the pulverisation stage • Occasional wet samples are encountered, extra cleaning of the splitter is carried out afterward • Chip samples have been analysed for Li suite elements via ICPMS, and for Au by 50g fire assay by Nagrom, NAL and ALS. • Hostorical core sampled by Red Dirt Metals was collected for ICPMS analysis via selection from NQ half and quarter core, and submitted to Nagrom • Samples analysed by Nagrom, NAL and ALS were dried, crushed and pulverised to 80% passing 75 microns before undergoing a selected peroxide fusion digest or 4 acid digest with ICPMS finish or fire assay with ICPMS finish • Semi-Quantitative XRD analysis was carried out by Microanalysis Australia using a representative sub-sample that was lightly ground such that 90% was passing 20 µm to eliminate preferred orientation • RC duplicate field samples were carried out at a rate of 1:20 and were sampled directly from the splitter on the rig. These are submitted for the same assay process as the primary samples and the laboratory are unaware of such submissions **Hostorical Data** • Hostorical chip sampling methods include single metre riffle split and 4m composites that were either scoop or spear sampled, while hostorical core was cut onsite and half core sampled • Hostorical samples were analysed at LLAS, Genalysis and unspecified laboratories • Hostorical Au analysis techniques generally included crushing, splitting if required, and pulverisation, with aqua regia or fire assay with AAS finish used to determine concentration • Hostorical multielement analysis was carried with mixed acid digest and ICP-MS determination
Quality of assay data and laboratory tests	**Red Dirt Metals** • Samples have been analysed by external laboratories utilising industry standard methods • The assay methods utilised by Nagrom, NAL and ALS for RC chip, rock chip and core sampling allow for total dissolution of the sample where required • Standards and blanks are inserted at a rate of 1 in 20 in RC and DD sampling, All QAQC analyses were within tolerance • No QAQC samples were submitted with rock chip analysis • No standards were used by Red Dirt Metals in the hostorical core ICP analysis or XRD quantification process. Internal duplicate and repeat analyses were carried out as part of the assay process by Nagrom, NAL

Criteria	Commentary
	and ALS, as well as internal standard analysis. • A standard mica phase was used for the XRD analysis. It is possible that a lithium bearing mica such as lepidolite is present. A subsequent analysis technique would be required for confirmation **Hostorical Data** • All hostorical samples are assumed to have been prepared and assayed by industry standard techniques and methods • Limited hostorical QAQC data has been supplied, industry standard best practice is assumed
Verification of sampling and assaying	**Red Dirt Metals** • Significant intercepts have been verified • No specific twinned holes have been completed, but drilling has verified hostorical drilling intervals • Primary data is collected via excel templates and third-party logging software with inbuilt validation functions, the data is forwarded to the Database administrator for entry into a secure SQL database. Hostorical data was supplied in various formats and has been validated as much as practicable • No adjustments to assay data have been made other than conversion from Li to Li2O and Ta to Ta2O5 **Hostorical Data** • Data entry, verification and storage protocols remain unknown for hostorical operators
Location of data points	**Red Dirt Metals** • MGA94 zone 51 grid coordinate system is used • Current drilling collars have been pegged using a handheld GPS unit, all collars will be surveyed upon program completion by an independent third party • Downhole surveys are completed by the drilling contractors using a true north seeking gyro instrument • Topography has been surveyed by recent operators. Collar elevations are consistent with surrounding holes and the natural surface elevation **Hostorical Data** • Hostorical collars are recorded as being picked up by DGPS, GPS or unknown methods and utilised the MGA94 zone 51 coordinate system • Hostorical downhole surveys were completed by north seeking gyro, Eastman single shot and multi shot downhole camera
Data spacing and distribution	• Drill hole spacing is variable throughout the programme • Spacing is considered appropriate for this style of exploration and resource development drilling • Sample composting has not been applied
Orientation of data in relation to geological structure	• Drill holes are orientated perpendicular to the regional trend of the mineralisation previously drilled at the project; drill hole orientation is not considered to have introduced any bias to sampling techniques utilised
Sample security	**Red Dirt Metals** • Samples are prepared onsite under supervision of Red Dirt Metals staff and transported by a third party directly to the laboratory. **Hostorical Data** • Sample security measures are unknown
Audits or reviews	• Internal audits are routinely carried out on significant intercepts.

Section 2; Reporting of Exploration Results

Criteria	Commentary
Mineral tenement and land tenure status	• Drilling and sampling activities have been carried on M29/2, M29/165 and E29/640 • The tenements are in good standing • There are no heritage issues
Exploration done by other parties	• The area has a long history of gold and base metals exploration and mining, with gold being discovered in the district in the 1890s. Numerous generations of exploration have been completed including activities such as drilling, geophysics and geochemical sampling • Targeted Li assaying was first carried out in the early 2000s by La Mancha Resources and more recently, lithium assays were completed by Ora Banda Mining
Geology	• The Mt Ida project is located within the Eastern Goldfields region of Western Australia within the Mt Ida/Ularring greenstone belt • Locally the Kurrajong Antiform dominates the regional structure at Mount Ida, a south-southeast trending, tight isoclinal fold that plunges at a low angle to the south. The Antiform is comprised of a layered greenstone sequence of mafic and ultramafic rocks. • Late stage granitoids and pegmatites intrude the sequence.
Drill hole Information	• A list of the drill hole coordinates, orientations and metrics are provided as an appended table
Data aggregation methods	• No metal equivalents are used
Relationship between mineralisation widths and intercept lengths	• The geometry of the Li mineralisation is currently unknown although preliminary interpretation suggests the pegmatite intrusive sills and bodies are orientated sub-parallel to the Mt Ida Granitic intrusion and the northwest trending amphibolite mafic units which bound the western and eastern limbs of the intrusive
Diagrams	• Figures have been included in the announcement
Balanced reporting	• It is not practical to report all hostoricalal exploration results from the Mount Ida Project. Relevant collars and details are contained within the body of the announcement
Other substantive exploration data	• None completed at this time
Further work	• Drilling is continuing at Mt Ida with a 60,000m programme consisting of a mix of RC and diamond drilling underway • Aircore and geochemical drilling will also be commenced along strike from the Mt Ida central area with the objective of targeting the pegmatite outcrops located in the mafic sequence sitting to the west of the Mt Ida granitic complex
