ASX ANNOUNCEMENT

## Maroochydore Copper – Cobalt Project Final RC Drilling Results

### HIGHLIGHTS

- Drilling extends massive Maroochydore copper-cobalt oxide resource potential
- Maroochydore is the 8<sup>th</sup> largest copper development project in Australia, ranked by contained copper metal
- Near-surface oxide copper-cobalt mineralisation extended to 3,000m long, up to 500m wide and up to 100m thick

### Significant Copper results include:

- 38m @ 1.04 % Cu & 508 ppm Co from 82m in 21MDRC027 including:
  - 20m @ 1.60 % Cu & 794 ppm Co from 86m
- 61m @ 0.92% Cu & 543 ppm Co from 71m in 21MDRC030 including:
  - 5m @ 1.39 % Cu & 795 ppm Co from 73m
  - 4m @ 1.92 % Cu & 794 ppm Co from 90m
  - 13m @ 1.77 % Cu & 818 ppm Co from 96m
- 61m @ 0.35 % Cu & 203 ppm Co from 56m in 21MDRC033 including:
  - 2m @ 0.45 % Cu & 146 ppm Co from 62m
  - 5m @ 0.46 % Cu & 244 ppm Co from 69m
  - 4m @ 1.27 % Cu & 212 ppm Co from 88m
  - 6m @ 0.46 % Cu & 342 ppm Co from 102m

### Significant Cobalt results include:

- 22m @ 0.19 % Cu & 529 ppm Co from 25m in 21MDRC022 including:
  - 4m @ 0.16 % Cu & 1,659 ppm Co from 42m
- 35m @ 0.31 % Cu & 743 ppm Co from 39m in 21MDRC024 including:
  - 7m @ 0.48 % Cu & 1,775 ppm Co from 48m
  - 6m @ 0.54 % Cu & 1,186 ppm Co from 60m

Managing Director Barry Cahill commented:

*“Repeated significant intersections demonstrate the robustness and size of this deposit at Maroochydore. Our initial drilling programme at Maroochydore targeted the oxide zones of the deposit and has returned better than expected results. We look forward to further developing the oxide and sulphide resource base of this large greenfield project in the next phase of drilling.”*

Cyprium Metals Limited (“CYM”, “Cyprium” or “the Company”) is pleased to report the remaining assay results from the initial drilling campaign which was completed in 2021 at the Maroochydore copper-cobalt project (refer to Figure 1).

The 50 RC drillhole programme included 46 resource definition and extension holes (5,990m) and 4 water monitoring bores (228m) for a total of 6,218 metres as detailed in Figure 2, Images 1 to 5 and Table 1.

The initial results from 18 resource extension drillholes and 1 water bore were the subject of the Cyprium announcement titled Maroochydore Cu-Co Project Initial RC Drilling Results released 14 February 2022.

Oxide mineralisation at Maroochydore has currently been drilled over a strike length of 3,000m, has a width up to 700m and thicknesses up to 100m, as outlined in Figure 2 and Sections 1 to 3. The 2021 RC drilling programme targeted oxide, supergene and transitional mineralisation at the project, the results of which will inform a mineral resource update for the project in the second half of 2022 to be utilised in a scoping study. Cyprium will release to the market the results of the mineral resource estimate and scoping study as and when they become available.

**Competent Person**

The information in this report that relates to Exploration Targets and Exploration Results is an accurate representation of the available data and is based on information compiled by external consultants and Mr. Daniel Noonan who is a member of the Australian Institute of Mining and Metallurgy (204063). Mr. Noonan is the Senior Resource Geologist for Cyprium Metals Limited, in which he is also a shareholder. Mr. Noonan has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person (CP). Mr. Noonan consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Cyprium confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and, in the case of estimates of Mineral Resources, which all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not materially changed from the original market announcement.

## About Cyprium Metals Limited

Cyprium Metals Limited (ASX: CYM) is an ASX listed company with copper projects in Australia. The Company has a highly credentialed management team that is experienced in successfully developing sulphide heap leach copper projects in challenging locations. The Company's strategy is to acquire, develop and operate mineral resource projects in Australia which are optimised by innovative processing solutions to produce copper metal on-site to maximise value.

The Company has projects in the Murchison and Paterson regions of Western Australia that is host to a number of base metals deposits with copper and gold mineralisation.

### Paterson Copper Projects

This portfolio of copper projects comprises the Nifty Copper Mine, Maroochydore Copper Project and Paterson Exploration Project.

The Nifty Copper Mine ("Nifty") is located on the western edge of the Great Sandy Desert in the north-eastern Pilbara region of Western Australia, approximately 330km southeast of Port Hedland. Nifty contains a 2012 JORC Mineral Resource of 940,200 tonnes of contained copper<sup>i</sup>. Cyprium is focussed on a heap leach SX-EW operation to retreat the current heap leach pads as well as open pit oxide and transitional material. Studies will investigate the potential restart of the copper concentrator to treat open pit sulphide material.

The Maroochydore deposit is located ~85km southeast of Nifty and includes a shallow 2012 JORC Mineral Resource of 486,000 tonnes of contained copper<sup>ii</sup>. Aeris Resources Limited (ASX: AIS, formerly Straits Resources Limited) holds certain rights to "buy back up to 50%" into any proposed mine development in respect of the Maroochydore Project, subject to a payment of 3 times the exploration expenditure contribution that would have been required to maintain its interest in the project.

An exploration earn-in joint venture has been entered into with IGO Limited on ~2,400km<sup>2</sup> of the Paterson Exploration Project. Under the agreement, IGO is to sole fund \$32 million of exploration activities over 6.5 years to earn a 70% interest in the Paterson Exploration Project, including a minimum expenditure of \$11 million over the first 3.5 years. Upon earning a 70% interest, the Joint Venture will form and IGO will free-carry Paterson Copper to the completion of a pre-feasibility study (PFS) on a new mineral discovery.

### Murchison Copper-Gold Projects

Cyprium has an 80% attributable interest in a joint venture with Musgrave Minerals Limited (ASX: MGV) at the Cue Copper-Gold Project, which is located ~20km to the east of Cue in Western Australia. Cyprium will free-carry the Cue Copper Project to the completion of a definitive feasibility study (DFS). The Cue Copper-Gold Project includes the Hollandaire Copper-Gold Mineral Resources of 51,500 tonnes contained copper<sup>iii</sup>, which is open at depth. Metallurgical test-work has been undertaken to determine the optimal copper extraction methodology, which resulted in rapid leaching times (refer to 9 March 2020 CYM announcement, "*Copper Metal Plated*", <https://cypriummetals.com/copper-metal-plated/>).

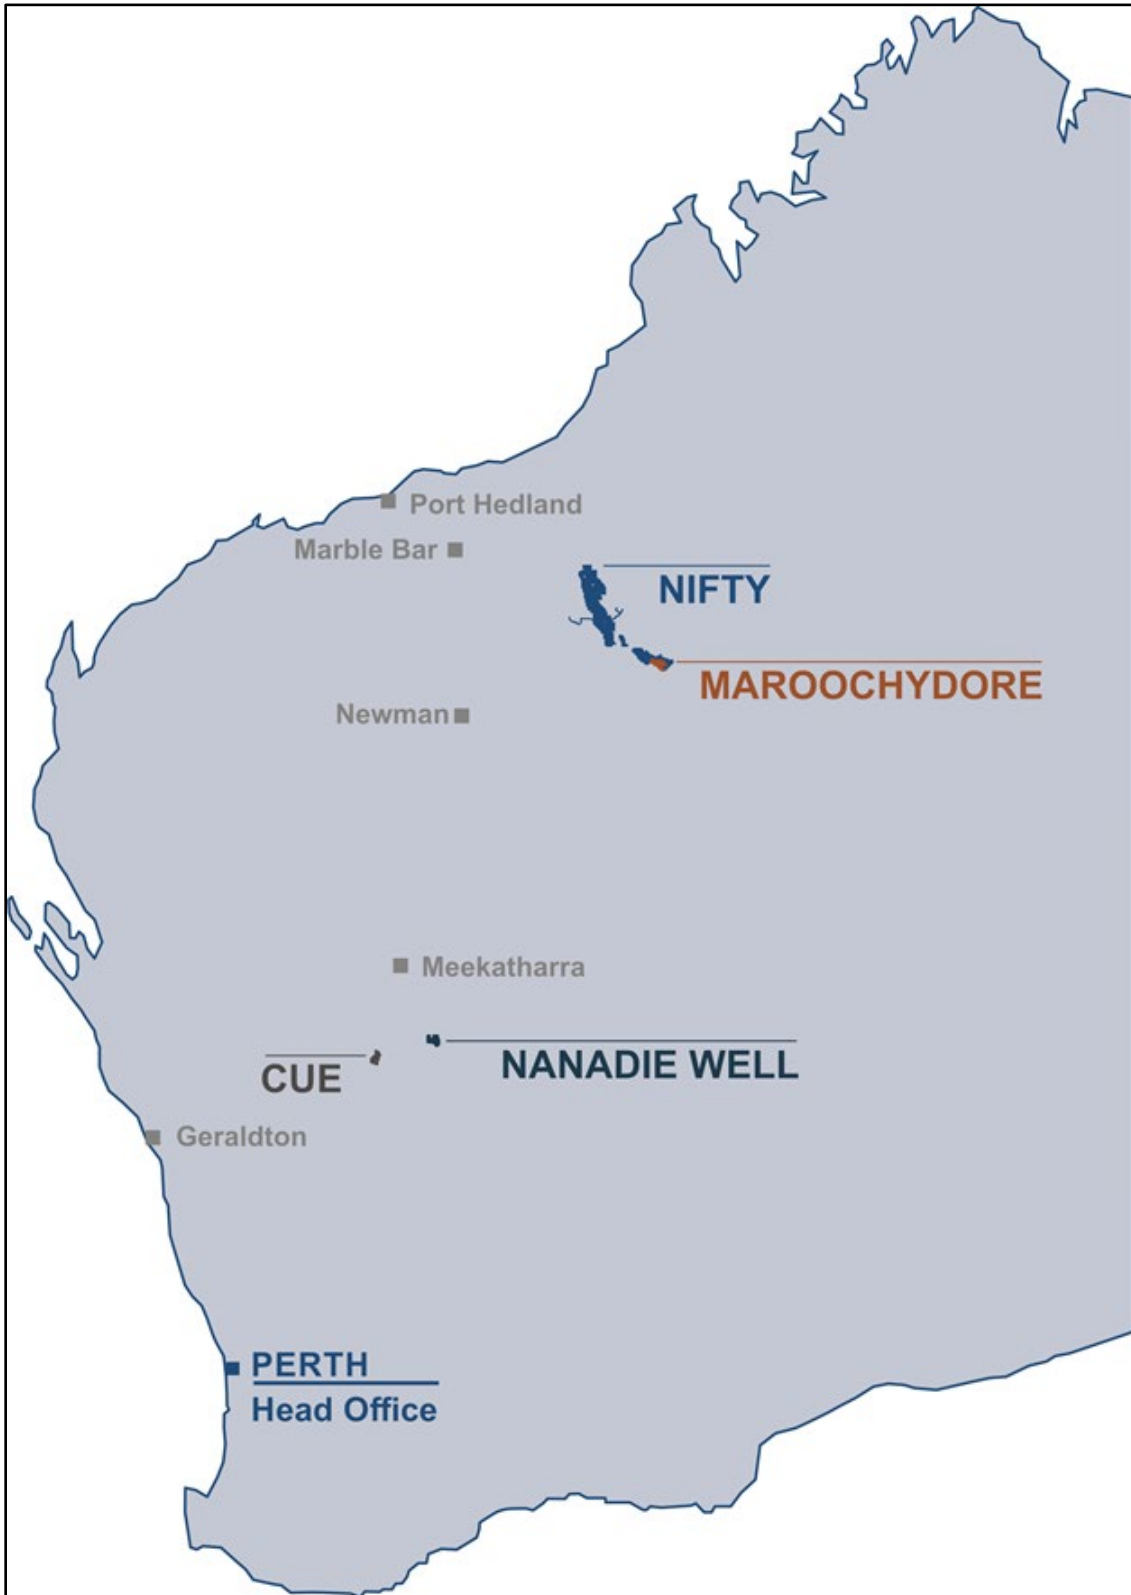

The Nanadie Well Project is located ~650km northeast of Perth and ~75km southeast of Meekatharra in the Murchison District of Western Australia, within mining lease M51/887.

The Cue and Nanadie Well Copper-Gold projects are included in an ongoing scoping study, to determine the parameters required to develop a copper project in the region, which provides direction for resource expansion work.

<sup>i</sup> Refer to CYM ASX announcement dated 16 May 2022 "28.4% increased Nifty Copper MRE to 940,200t copper metal"

<sup>ii</sup> Refer to MLX ASX announcements: 10 March 2020, "Nifty Copper Mine Resource Update" and 18 August 2016, "Annual Update of Mineral Resources and Ore Reserves"

<sup>iii</sup> Refer to CYM ASX announcement: 29 September 2020, "Hollandaire Copper-gold Mineral Resource Estimate"

Minimum interval Cu equivalent:

- 1m if Cu eq > 0.40 %, 3m if Cu eq < 0.40 %. Minimum interval grade 0.10% Cu. No internal waste - break interval if result < 0.10% Cu eq.

Minimum interval Co:

- 1m if Co > 400 ppm, 3m if Co < 400 ppm. Minimum interval grade 100 ppm Co. No internal waste - break interval if result < 100 ppm Co.

## JORC Code, 2012 Edition – Table 1 report

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i>	1m RC drill chip samples weighing 3.0kg were taken from the splitter on the NDRC drill rig for analysis at Bureau Veritas (BV) Canning vale laboratory which is standard industry practice for geochemical analysis of RC drill ships. A 3.0kg reference sample is retained by Cyprium at the Maroochydore core yard which can be used for further analysis if required.
	<i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i>	For all RC drilling programmes, regular air and manual cleaning of cyclone was carried out to remove wet material as and when it was present.  Cyprium RC drilling utilises certified standards and blanks (CRMs) added to the submitted assay batches to test laboratory equipment calibration. Excessive variance or inaccuracy of the CRMs will be investigated by Cyprium Metals staff for causes and corrective actions if required.
	<i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where ‘industry standard’ work has been done this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i>	Cyprium sampling techniques are considered by the company to be industry standard for the 2021 RC drilling programme.  3kg RC samples have been submitted to Bureau Veritas Canning Vale WA for base and precious metal analysis. Samples will be crushed and pulverised, then 40g subsampled and fire assayed with AAS finish (FA002) for Au, Pt and Pd; mixed acid digest (MA200) with ICP-AES finish (MA201) for Al, Ca, Cr, Fe, K, Mg, Mn, Na, Ni, P, S, Ti and V and ICP-MS finish (MA202) for Ag, As, Ba, Be, Bi, Cd, Co, Cu, Mo, Pb, Sb, Tl, U and Zn.
Drilling techniques	<i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	Cyprium 2021 RC drilling programme was carried out with a Schramm 64 – Mounted on an International 2670 8 x 4 truck, capable of 350m @ 4” RC. On-board Sullair 350/900 cfm compressor, rig mounted sample system through a cone splitter. Auxiliary truck mounted Ingersoll Rand 350/1,070 cfm compressor coupled to a 2010 Air Research Booster compressor capable of 900 psi @ 1,800cfm booster
Drill sample recovery	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i>	The 2021 Cyprium RC drilling programme was noted by field staff to have excellent sample return. Quantitative sample return measurements will be taken during phase 2 drilling.
	<i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i>	During the 2021 Cyprium RC drilling programme, 1m samples were collected from the cone splitter - 90% section in a 25-litre bucket and placed on the ground in rows of 10 for logging. Two 3kg to 5kg samples are collected directly from the drill rig cone

Criteria	JORC Code explanation	Commentary
		<p>splitter - 10% offtakes in calico bags, one of which was retained on site for reference purposes and the other sent to BV Perth for analysis. No low sample return was observed by Cyprium geologists during the January 2021 drilling campaign.</p> <p>The drill cyclone/splitter and sample buckets were cleaned between rod changes and after each drill hole was completed to minimise down-hole and cross-hole contamination.</p>
	<i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	The 2021 RC drill sample recovery was observed to be satisfactory during the campaign and it is believed that no preferential loss/gain of material was recorded by Cyprium technical staff.
Logging	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i>	Detailed logging of lithology, mineralisation, alteration, veining and weathering was completed for all RC holes. All logging details were collected using an Ocris logging template and subsequently transferred to the company's main drilling database.
	<i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i>	<p>The RC logging was qualitative.</p> <p>The RC chip trays were photographed by Cyprium.</p>
	<i>The total length and percentage of the relevant intersections logged.</i>	All RC intervals were logged.
Sub-sampling techniques and sample preparation	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	All holes and assay results commented upon in this release relate to RC drill holes.
	<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i>	<p>6m composite samples were analysed through the Tertiary and Permian cover sequence and 1m RC split samples were analysed within the underlying Proterozoic basement sequence.</p> <p>The RC composite samples were collected from the drill rig by scooping a sub-sample from each original 1m sample split into a fresh calico bag to generate a 6m composite sample.</p> <p>All the original 1m sample splits taken through the cover sequence are held onsite. If any anomalous results are reported from the 6m composite analyses, the corresponding Individual 1m sample splits are held at the Maroochydore sample bag storage area. These will only be despatched to the laboratory for follow-up analysis in the event that anomalous results are reported from the 6m composite analyses. To date no anomalies have been identified from the composite analyses.</p> <p>Wet intersections were left to dry before sampling and noted by the geologist in the relevant logs.</p>
	<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	2021 Cyprium programme utilises standard sample preparation procedures of oven drying at 105°C, jaw crushing to <3mm, riffle splitting only if the sample mass exceeds 3kg, pulverisation of the 3kg sub-sample split (PR001, PR103 & PR303). A 200g subsample pulp is then split from the pulverised mass for subsequent analysis.

Criteria	JORC Code explanation	Commentary
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	The 2021 Cyprium programme was sampled from the drill rig cone splitter as detailed above. Any material from the 1m drilling interval has an equal chance of being sampled in the 3kg sample bag sent to the laboratory for analysis.
	<i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i>	Field duplicates are being taken from the 3kg reference sample bag to test the representivity of the samples taken by the drill rig sampling equipment.
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	RC drilling sample sizes were industry standard and are considered by the company to be appropriate to sample the sedimentary hosted copper mineralisation at the Maroochydore Project.
<i>Quality of assay data and laboratory tests</i>	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i>	<p>A nominal 3kg RC sample split was submitted to Bureau Veritas Canning Vale WA for base and precious metal analysis. Samples were crushed and pulverised and a nominal 40g subsample was then fire assayed with ICP-AES finish (FA002) for Au, Pt and Pd which is an industry standard total analysis technique considered by Cyprium to be suitable for identifying any anomalous precious metal mineralisation within the Maroochydore Permian sedimentary cover / tertiary paleochannels.</p> <p>A further 0.15g sub-sample was taken for four acid digest (MA200) with ICP-AES finish (MA201) for Al, Ca, Cr, Fe, K, Mg, Mn, Na, Ni, P, S, Ti and V and ICP-MS finish (MA202) for Ag, As, Ba, Be, Bi, Cd, Co, Cu, Mo, Pb, Sb, Tl, U and Zn which is an industry standard total analysis technique and is considered by Cyprium to be appropriate for the Maroochydore sediment hosted base metal mineralisation.</p>
	<i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i>	No geophysical results are discussed or included with this report. No XRF analyses are commented upon in this release.
	<i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i>	<p>Certified Reference Materials (CRM) and blanks were submitted with the laboratory samples at a rate of 1 CRM in every 20 and 1 blank sample in every batch of 50 samples. The CRM/blank results have been analysed by Cyprium metals technical team and no adverse analyses were identified. All CRM results were within 1 standard deviation of the expected result. There was a slight bias in that the majority of the CRM assays reported slightly lower than the expected value.</p> <p>Bureau Veritas also conducts their own inhouse quality control programme that includes regular repeats, standards and blanks, the results of which are provided to Cyprium Metals.</p>
<i>Verification of sampling and assaying</i>	<i>The verification of significant intersections by either independent or alternative company personnel.</i>	Cyprium Geologists visually verified and logged significant mineralisation intersections in RC chips and drill core in the 2021 Maroochydore drilling campaign.

Criteria	JORC Code explanation	Commentary
	<i>The use of twinned holes.</i>	None drilled – proposed for subsequent drilling campaigns.
	<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i>	Cyprium 2021 logging data was collected using Ocris software on Panasonic Toughbook laptop computers. Data is then sent to WPData consultants for validation and compilation into an SQL database hosted by WPData for Cyprium.
	<i>Discuss any adjustment to assay data.</i>	No adjustments have been made to any of the data.
<i>Location of data points</i>	<i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i>	Drillhole collars surveyed with an RTK-DGPS, accuracy +/-0.5m.
	<i>Specification of the grid system used.</i>	GDA94, zone 51 and Maroochydore mine grid. Maroochydore Mine grid is calculated from zone 51 GDA94 using the following parameters: <ul style="list-style-type: none"> <li>• Scale factor: 0.999609619</li> <li>• Rotation: 314° 41' 22" mine grid = 000° GDA north</li> <li>• North shift: -7,498,104.249</li> <li>• East shift: -419,459.409</li> <li>• Elevation shift: +10,000 m</li> </ul>
	<i>Quality and adequacy of topographic control.</i>	Utilising digital terrain models developed by previous project operators Metals X. To be reviewed by Cyprium Metals in 2022.
<i>Data spacing and distribution</i>	<i>Data spacing for reporting of Exploration Results.</i>	Drillhole spacing is considered by Cyprium to be appropriate for the sediment hosted copper mineralisation being tested at Maroochydore.
	<i>Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i>	Cyprium is undertaking infill and extensional drilling to complete a 2012 JORC compliant Mineral Resource Estimate update for Maroochydore.
	<i>Whether sample compositing has been applied.</i>	Cyprium created 6m composite samples in the Permian overburden of the Maroochydore deposit. The 1m sample splits will be analysed if any geochemical anomalism is noted from any of the preliminary composite analyses. To date, no significant results have been reported from analysis of the cover sequence.
<i>Orientation of data in relation to geological structure</i>	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i>	The strike of the Maroochydore oxide/supergene mineralisation is North-West / South-East and generally flat lying. The 2021 drilling pattern is designed to achieve unbiased sampling along the strike of the deposit. The horizontal to sub-horizontal nature of the oxide/supergene mineralisation will not be biased by the vertical drillholes of the 2021 drilling programme.
	<i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	The angle of the drill holes is close to normal to the mineralisation, no sample bias has been introduced through the drill orientation.

<b>Criteria</b>	<b>JORC Code explanation</b>	<b>Commentary</b>
<i>Sample security</i>	<i>The measures taken to ensure sample security.</i>	2021 Cyprium RC samples were delivered to the Nifty store's facility for delivery via VPL Transport company to Bureau Veritas Laboratories Canning Vale WA. The 3 kg calico lab samples are collected in groups of 6 to 10 in 600 mm x 900 mm green plastic bags and transported in 1.5t bulka bags on pallets. Bureau Veritas did not note any irregularities with the samples delivered to the laboratory.
<i>Audits or reviews</i>	<i>The results of any audits or reviews of sampling techniques and data.</i>	Cyprium 2021 sampling techniques or data have not yet been externally reviewed or audited.

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i>	<p>The Maroochydore Copper Project consists of:  M45/314, M45/315, M45/317, M45/318, M45/492, E45/1840, E45/1841, E45/3011, E45/4318, E45/4319, P45/2924, P45/2925, P45/2926, P45/2927, P45/3055, P45/3150, P45/3151. Granted, 100% Maroochydore Copper PL (MCPL - 100% owned Cyprium Metals subsidiary) ownership.  E45/1018. Granted, 75% MIM Ltd / 25% MCPL. 75% MIM interest currently being transferred to MCPL.  E45/5705. Application, 100% MCPL.  M45/711, M45/712, M45/713, M45/745. Applications, 75% MIM Ltd / 25% MCPL. 75% MIM interest currently being transferred to MCPL.  M45/746. Application, 100% MIM currently being transferred to MCPL.</p> <p>The Maroochydore Project copper/cobalt resource occurs on granted mining leases M45/314, M45/315, M45/317 and M45/318. These mining leases were granted prior to the commencement of the Native Title Act 1993 (Cth) and, as such, are excluded from the requirements of Cyprium's project-wide agreement with the relevant native title party. The mining leases have been the subject of previous Aboriginal Heritage site clearance surveys.</p> <p>The balance of the tenements was determined to have Native Title for the Martu People in 2002. An Indigenous Land Use Agreement was signed by Metals X limited in 2020 which set out how Metals X and subsequently MCPL may access the land for exploration purposes.</p> <p>Maroochydore claw back right:</p> <p>Under an agreement between Omega Mines Ltd and Mount Isa Mines Ltd, there are certain Buy Back Rights pertaining to certain tenements at the Maroochydore Project.</p> <p>Maroochydore Copper Pty Ltd now hold the Omega rights and Aeris Resources (formerly Straits Resources) hold the Mt Isa Mines rights. The terms of the agreement are summarised as follows:</p> <p>The Maroochydore Project area originally formed part of the separate Broadhurst Range Joint Venture, the interests in which were originally held by Omega Mines Ltd and Mount Isa Mines. In 1994 however, the Maroochydore area was extracted from the Broadhurst Range Joint Venture as part of a sole risk operation by Omega Mines Ltd. This sole risk interest became the Maroochydore Project Joint Venture, all interests in which are now owned by Maroochydore Copper Pty Ltd. The other joint venture participant in the Broadhurst Range Joint Venture, Mount Isa Mines, held certain rights to "buy back" into any proposed mine development in respect of the Maroochydore Project. In 2003 Mount Isa Mines transferred its interest in the Broadhurst Range Joint Venture to Aeris Resources (formerly Straits Resources).</p>

Criteria	JORC Code explanation	Commentary
		The buyback rights now held by Aeris Resources included the right to elect to participate in any proposed development to establish a mine with respect to the tenements comprised in the Maroochydore Project. The election can be up to a maximum of a 50% interest in the proposed development, subject to a payment being made by Aeris Resources to Maroochydore Copper Pty Ltd. Such amount is (i) the exploration expenditure contribution that Straits would have been required to have made, had it held the relevant Participating Interest it has elected to buy, during the period it was held as a sole risk area, plus (ii) an additional sum of money equal to two times the amount in (i).
	<i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	The tenements are in good standing.
<i>Exploration done by other parties</i>	<i>Acknowledgment and appraisal of exploration by other parties.</i>	<p>Copper anomalism was identified at Maroochydore by Esso Australia Ltd between 1984 to 1986 conducting mapping geophysical surveys. 673 rock chip, 86 soil and 731 stream sediment samples. 1,440 RAB, 24 RC and 16 diamond drillholes.</p> <p>City Resources Ltd acquired project in December 1986. Data compilation and re-logging of Esso core to August 1988.</p> <p>Chevron Exploration / City Resources JV from August 1988 Chevron as managers. Data compilation and thematic mapping. Chevron sold their JV interest to Barrack Mines in August 1989.</p> <p>Barrack Mines / City Resources JV held the project from August 1989. 94 RC drillholes were completed. First resource estimate of 14Mt @1.6% Cu at 1% cut off was completed in 1990. Preliminary mineralogical and metallurgical studies were undertaken.</p> <p>Mount Isa Mines (MIM) acquired Barrack's JV interest in July 1991 and Omega Mines Ltd acquired City Resources' JV interest in November 1991. Together they completed detailed mapping, rock chip sampling and trialled lag sampling. They also undertook Petrographic sampling and analysis. Genetic model changed from epigenetic to diagenetic. R McNight UWA honours thesis. Gravity and EM geophysics. 330 RAB, 9 RC and 12 diamond drillholes were drilled.</p> <p>Murchison United Ltd acquires Omega Mines in March 1994</p> <p>MIM / Murchison United JV from March 1994. Dr A Reed PhD studies included detailed mapping and relogging of drill core and chips which resulted in reverting to an epigenetic ore genesis model. A further, 7 diamond drillholes were completed. Mineralogical studies were also undertaken.</p> <p>Straits Resources acquired MIM's JV interest in 1996. 83 RC and 4 diamond drillholes completed. Snowden Consulting oxide resource estimation of 14Mt @1.6% Cu and 0.07% Co at 1.0% cut off reported by Straits in 1996.</p> <p>Straits / Murchison JV from 1996 to 2003 completed a further 41 diamond drillholes and Snowden's on behalf of the JV completed an updated mineral resource estimate of 138Mt @ 0.57% Cu at 0.20% Cu cut off for 786.6Kt contained Cu metal. As part of the</p>

		<p>2000 scoping study, work was completed to determine a process path for the project. This included 1996/1997 mineralogical and acid digest work, the 1997/1998 ore characterisation, column leach, solvent extraction and flotation tests and the 1998/1999 Gravity separation, flotation and ferric leaching test work.</p> <p>Aditya Birla acquired Straits Resources interest in the Maroochydore Project in January 2003. Further, metallurgical and processing studies were undertaken. P. Muhling (CSA) completed a regional exploration targeting study and accompanying report. Gravity and VTEM geophysical surveys were completed. In 2008, Snowden's updated the Resource Estimate as 41.2Mt @ 0.82% Cu and 0.04% Co at a 0.50% Cu cut off. This resource was used for Hatch 2008, pre-feasibility study.</p> <p>Aditya Birla (ABY) acquires Renison Bell's JV interest in January 2010 and then operated the project as sole owner until 2016. IP and aeromagnetic geophysical surveys were completed during this period. CSA consulting completed further reviews. These included metallurgical and processing study reviews, flotation test work and a revised scoping study in 2008/2009. ABY drilled 120 RC and 59 diamond drillholes. The Resource was re-estimated in December 2013 (oxide) and March 2014 (sulphide) as 48.6 Mt @ 1.00% Cu and 0.038% Co which comprises the current JORC 2012 compliant mineral resource.</p> <p>Metals X (MLX) acquired Aditya Birla Australia on 31 August 2016. In 2017, MLX drilled 2 RC and 17 diamond drillholes. Maroochydore Business Opportunity review completed May 2020.</p> <p>Cyprium Metals acquired MCPL from Metals X on 31 March 2021. Cyprium drilled 46 resource definition RC and 4 water bore RC holes as well as 6 diamond drillholes during the 2021 field season. This report includes a summary of all the significant assay results (&gt;0.1% Cu) received to date from the 2021 RC drilling programme. The 6 diamond holes are undergoing processing and analysis for geochemical, metallurgical and waste characterisation properties.</p>
<i>Geology</i>	<i>Deposit type, geological setting and style of mineralisation.</i>	<p>Sediment hosted epigenetic copper mineralisation.</p> <p>Flat lying oxide/supergene copper mineralisation occurs at the top of the current and paleo water table levels.</p>
<i>Drill hole Information</i>	<p><i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i></p> <p><i>easting and northing of the drill hole collar</i></p> <p><i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i></p> <p><i>dip and azimuth of the hole</i></p> <p><i>down hole length and interception depth</i></p> <p><i>hole length.</i></p>	<p>Refer to Table 1 and Appendix 1 in the body of this announcement.</p>

Criteria	JORC Code explanation	Commentary
	<i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i>	Assay results below 0.1% Cu have been excluded from this release as they are not considered material by Cyprium. Where samples were lost due to bad ground, excessive groundwater and cavities during the campaign the interval is reported as No Sample Received (NSR) and no assay was completed for that interval.
`1Data aggregation methods	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i>	All intercepts are reported as down-hole length weighted averages. Drill intercepts are near normal to the flat lying oxide/supergene mineralised blanket.
	<i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i>	All sample intervals are 1m splits.
	<i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>	No metal equivalent values have been reported.
Relationship between mineralisation widths and intercept lengths	<i>These relationships are particularly important in the reporting of Exploration Results.</i>	The oxide/supergene mineralisation is flat lying to sub-horizontal and true mineralisation widths are 90% to 100% of downhole widths.
	<i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i>	As above.
	<i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i>	Down hole widths have been reported as all holes were drilled close to normal to the flat lying oxide/supergene mineralisation blanket.
Diagrams	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	Figures included in the body of the release show drillhole location, the approximate outline of the previously reported Metals X 2013 mineral resource and two representative sections to detail drill intercepts on those sections from the 2021 drill programme.
Balanced reporting	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	Values above 0.1% Cu have been reported in Appendix 1, as determined by Cyprium's significant intercept criteria .
Other substantive exploration data	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results;</i>	A summary of previous material geological work completed at the Maroochydore project is detailed in the Exploration by Other Parties section of this table.

Criteria	JORC Code explanation	Commentary
	<i>geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	Other modifying factors such as metallurgical, environmental, hydrological and geotechnical factors have been investigated by previous operators at Maroochydore as detailed in the Exploration by Other Parties section of this table.
<i>Further work</i>	<i>The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling).</i>	Further resource definition and extension drilling programmes are currently being planned.
	<i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	Undergoing compilation and review – to be released when available.
