

# **Oracle Ridge Copper Mine Update**

## **Highlights**

- Resource development activities continue with expansion and infill drilling focussed on the Talon:
  - Assay results for 22 holes received, including the following resource expansion holes:
    - 12.5m at 2.08%Cu, 18.81g/t Ag and 0.33g/t Au (WT-22-88)
    - 10.7m at 2.23% Cu, 19.62g/t Ag and 0.35g/t Au (WT-22-110)
    - 9.2m at 2.20% Cu, 35.72g/t Ag and 0.45g/t Au (WT-22-140)
    - 8m at 2.98% Cu, 27.46g/t Ag and 0.33g (WT-22-143)
  - Updated Mineral Resource Estimate ongoing with the next update on schedule for the end of September 2022
  - Mapping and sampling of historical mines adjacent to Oracle Ridge underway to refine the local geology model, aid the Mineral Resource Estimate (MRE) and identify new drill targets
- Project development activities are progressing at an accelerated pace:
  - Underground refurbishment:
    - Mining contractor engaged and currently on site
    - Maintenance of existing electrical and ventilation infrastructure ongoing
    - Generator installed with the mine planned to be re-energised by the end of August allowing more active underground work including drilling and mapping and sampling to commence shortly
  - Metallurgical consultant engaged to review historical metallurgical test work and recommend further studies to optimise metallurgical recoveries
  - Hydrological studies planned

## Commenting on the ongoing activities, Eagle Mountain Mining's CEO, Tim Mason, said:

"With drilling continuing, we have concurrently launched several initiatives to continue to advance the Project.

The mining contractor is currently on site refurbishing the underground mine, with the generator already delivered and installed and the electrical equipment currently being serviced with the ventilation fans to follow shortly thereafter. Our goal is to leverage the existing infrastructure to drill and sample underground. We are only two months away from driving our first underground rig through the Oracle Ridge portals.

Metallurgical studies have commenced to review and update existing information that we will need for the upcoming mining studies.

On the geological front, the team is currently mapping the historical workings peripheral to the Oracle Ridge mine and also fine tuning our drilling plans for OREX. "

Eagle Mountain Mining Limited (ASX:EM2) (Eagle Mountain, or the Company) is pleased to provide an update on its 100% owned Oracle Ridge Copper Mine Project (Oracle Ridge, or the Project) in Arizona, USA.

## **Resource Development Activities**

#### Drilling

The Company continues to drill from surface at Oracle Ridge. Drilling is still focused on the Talon area with a few holes also testing peripheral extensions to the west and north of the mine. Assay results have been received for 22 holes which are detailed below.

#### Resource Expansion Results

Results for 17 resource expansion holes have been received (Table 1, Attachment 1) which continue to support the potential for growth of the Company's MRE at a 1% copper cut-off grade. Key observations are presented below.

#### Eastern Talon

Further assays have been received from drilling in the eastern Talon (Figure 1), a target that was sparsely drilled by previous explorers.

#### Results include:

- 8.1m at 2.28% Cu, 18.07g/t Ag and 0.40g/t Au and 8.0m at 2.98% Cu, 27.46g/t Ag and 0.33g/t Au across two zones in drill hole WT-22-143. This is the northern part of the eastern Talon target with assays pending from three nearby holes.
- 9.2m at 2.20% Cu, 35.72g/t Ag and 0.45g/t Au in drill hole WT-22-140 to the south of WT-22-143. The drill hole intersected a second, lower grade mineralised zone spatially consistent with that observed in WT-22-143.
- WT-22-130, WT-22-133, WT-22-136, WT-22-142 and WT-22-147 returned the following zones above the reporting cut-off (1% Cu). Results include:
  - o 1.6m at 2.04% Cu, 16.10g/t Ag and 0.33g/t Au (WT-22-130)
  - o 3.5m at 1.59% Cu, 14.40g/t Ag and 0.32g/t Au (WT-22-133)
  - o 3.5m at 1.71% Cu, 19.92g/t Ag and 0.33g/t Au (WT-22-136)
  - o 2.2m at 2.23% Cu, 36.01g/t Ag and 0.67g/t Au (WT-22-142)
  - o 1.6m at 3.17% Cu, 28.30g/t Ag and 0.38g/t Au (WT-22-147).

Mineralisation across the eastern Talon target appears thinner and more discontinuous than in the southern and western Talon, with thickness and grade increasing from south to north. These results are likely to have an impact on the next update to the MRE.

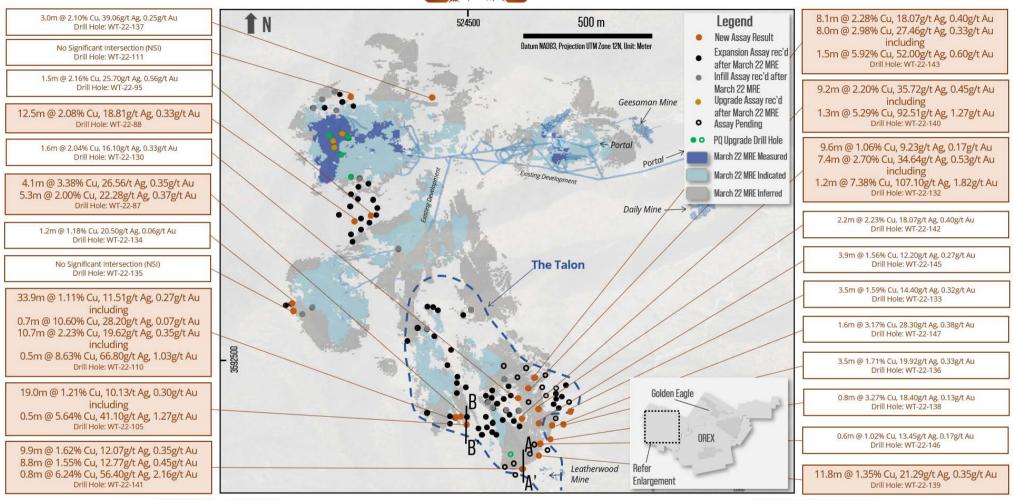

Figure 1 – Plan view of the mine area showing holes with new assays received. Selected results shown, refer to Attachment 1 for all assay results. Drill holes used to define the JORC Resource have been omitted for clarity. The points shown represent the approximate midpoint of each intercept.

The Company has also completed a surface mapping and sampling program across outcropping mineralisation in the eastern Talon. Results will be incorporated into the geological model and used to improve confidence in the upcoming MRE.

#### Southern Talon

Drilling in the southern Talon returned:

- 9.9m at 1.62% Cu, 12.07g/t Ag and 0.35g/t Au and 8.8m at 1.55% Cu, 12.77g/t Ag and 0.45g/t Au in drill hole WT-22-141 (Figure 2). This is the southernmost hole completed at Oracle Ridge in the current drilling program. Results are approximately 80 metres from topography to the south. Strong mineralisation in outcrop and historical workings at the nearby Leatherwood mine firmly suggests this mineralisation is continuous between WT-21-141 and surface.
- 11.8m at 1.35% Cu, 21.29g/t Ag and 0.35g/t Au in drill hole WT-22-139. Mineralisation is localised near the Leatherwood contact and shows thickness consistent with historical hole C-118, approximately 80 metres to the east. Results from WT-22-139 also strongly support the interpretation that mineralisation at the southern Talon is continuous to surface and daylights in the Leatherwood mine area.

#### Western Talon

Drilling at the western Talon tested potential southern extensions to mineralisation as well as gaps in the previous drilling.

Positive results were returned on both fronts including:

- 10.7m at 2.23% Cu, 19.62g/t Ag and 0.35g/t Au (including 0.9m at 8.63% Cu, 66.80g/t Ag and 1.03g/t Au); 10.5m at 1.23% Cu, 11.07g/t Ag and 0.31g/t Au and 33.9m at 1.11% Cu, 11.51g/t Ag and 0.27g/t Au (including 0.7m at 10.60% Cu, 28.20g/t Ag and 0.07g/t Au) in WT-22-110. The drill hole confirmed the thick mineralised intersection in nearby drill hole WT-21-45.
- 19.0m at 1.21% Cu, 10.13g/t Ag and 0.30g/t Au in WT-22-105 (Figure 3). This result has extended mineralisation southwards by approximately 50 metres.
- 4.1m at 3.38% Cu, 26.56g/t Ag and 0.35g/t Au and 5.3m at 2.00% Cu, 22.28g/t Ag and 0.37g/t Au in WT-22-87. Results were across three zones including a thin, high-grade interval at the top and two broader zones with lower grade mineralisation in the bottom section of the hole.

#### Other areas

Five holes were drilled at the western and northern end of Oracle Ridge:

- Holes WT-22-88 and WT-22-95 were drilled to the south of the main mine area. WT-22-95 returned narrow mineralisation while WT-22-88 encountered an unexpected zone of 12.5m at 2.08% Cu, 18.81g/t Ag and 0.33g/t Au. This latter intercept is significantly thicker than mineralised intervals in nearby holes. A geological review is ongoing to establish if a different mineralisation structure can be ascertained from this interesting intercept.
- WT-22-111 and WT-22-137 were drilled at the northern end of the mine area. The former did not return intersections above the cut-off grade. The latter returned a best interval of 3m at 2.10% Cu, 39.06g/t Ag and 0.25g/t Au in a thick, lower grade mineralised zone.

• WT-22-135 was designed to test for extensions to Inferred mineralisation in the western mine area. The drill hole intersected narrow, low grade mineralisation. This result, together with that reported for infill hole WT-22-134, is expected to have a negative impact on the next MRE in this area.

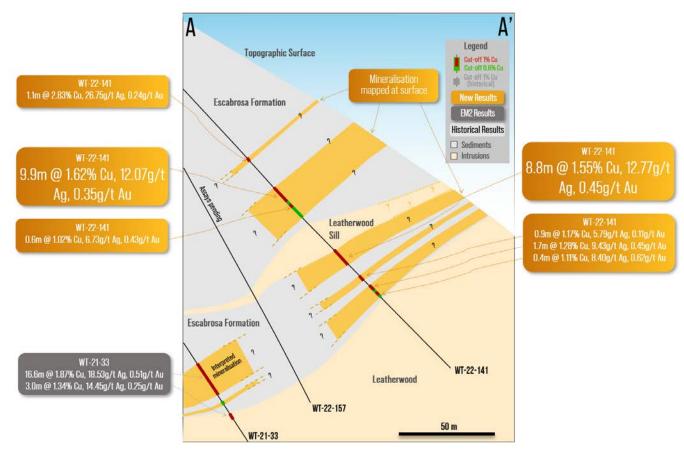

Figure 2 – Southern Talon – North-south cross-section including drill hole WT-22-141, showing mineralised intersections and relationships with nearby drill holes and local geology (refer Figure 1 and ASX announcement 1 December 2021).

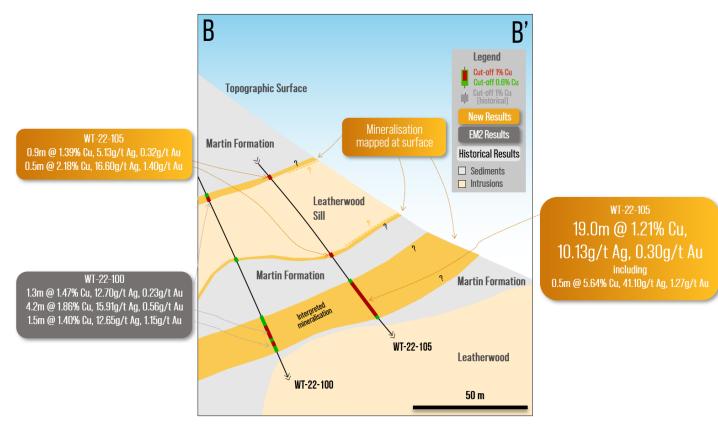

Figure 3 – Western Talon – North-south cross-section including drill hole WT-22-105, showing mineralised intersections and relationships with nearby drill holes and local geology (refer Figure 1 and ASX announcement 6 June 2022).

*Note – intercepts shown are downhole widths and not true widths* 

#### Resource Infill Results

Results from five infill holes were received. These holes were drilled at a nominal Inferred spacing of 50 metres within the footprint of the existing MRE at a 1% copper cut-off grade. These holes are designed to improve resource confidence and are a necessary step for future studies.

Key observations from the results of resource infill holes include:

- 9.6m at 1.06% Cu, 9.23g/t Ag and 0.17g/t Au and 7.4m at 2.70% Cu, 34.64g/t Ag and 0.53g/t Au (including 1.2m at 7.38% Cu, 107.10g/t Ag and 1.82g/t Au) in WT-22-132. The drill hole was completed in the southern Talon area and broadly confirmed results from surrounding holes.
- WT-22-138 and WT-22-146 were drilled in the eastern Talon and confirmed the thin nature of the mineralisation in this part of Oracle Ridge. Best results include:
  - o 0.8m at 3.27% Cu, 18.40g/t Ag and 0.13g/t Ag (WT-22-138)
  - o 0.6m at 1.02% Cu, 13.45g/t Ag and 0.17g/t Au (WT-22-146)
- 3.9m at 1.56% Cu, 12.20g/t Ag and 0.27g/t Au in WT-22-145 drilled in the eastern Talon.
- 1.2m at 1.18% Cu, 20.50g/t Ag and 0.06g/t Au in WT-22-134 testing the Inferred resource in the western mine area. The drill hole returned thinner and lower grade mineralisation than expected and will have an adverse impact on the resource estimate in this area.

Table 2 – Summary of significant Resource Infill results above 1% Copper cut-off grade

Hole ID	From	То	Width	Cu	Ag	Au
	[m]	[m]	[m]	[%]	[g/t]	[g/t]

#### Mineral Resource Estimate

SRK Consulting has been engaged to assist with the next update of the MRE which is expected to be announced by the end of September 2022.

#### **OREX** drilling

The Company is working closely with the United States Forest Service to finalise the drilling permit over the OREX target. OREX represents a high priority exploration opportunity due to its geological similarities and proximity to the Oracle Ridge mine as well as the significant mineralisation mapped and sampled during previous geological mapping campaigns (see ASX announcement 16 April 2021).

The planned drilling program is designed to minimise surface disturbance by using predominantly existing roads and establishing drill pads in areas requiring minimal clearing.

Figure 4 – Photo of the OREX prospect (foreground) with Oracle Ridge mine portals in the background (arrow). Note historical drill roads and the gentle terrain which will simplify access to OREX

## Geological mapping

There are several small-scale historical mines in the area surrounding the Oracle Ridge mine. These are now believed to be accessing the same mineralised system which the Company has been drilling over the last two years.

Geological mapping and sampling have been completed over some of these mines to improve the understanding of the local geology and assist with the compilation of a geological model. This work has supported the concept that the mineralisation currently being drilled daylights in the southern Talon area (e.g. Leatherwood mine, Figure 1) and the eastern Talon.

Further work is currently ongoing at historical prospects at the western end of the Project, where high-grade copper samples are documented in historical reports. Mapping will help understand the local geology, its correlation with the main mineralisation at Oracle Ridge and possibly identify drill targets to be tested as part of the resource expansion program.

## Further Underground Activities

The Company has now planned key underground activities to be implemented after the underground infrastructure refurbishment provides working access to the mine. These include underground drilling and sampling.

#### Underground drilling

Underground drilling is expected to commence in early Q4 2022. The contract has been awarded to Boart-Longyear on the back of the positive relationship built after two years of successful surface drilling at the Project.

The drilling program will focus on increasing resource confidence and achieving a drill spacing capable of supporting additional Measured and Indicated resources. Measured and Indicated resources are critical to the Company's development journey because they can be converted into Proven and Probable reserves after completion of a pre-feasibility or feasibility study. A small portion of the planned drilling will also test for near mine targets.

Underground drilling offers several advantages over surface drilling namely:

- Shorter holes, resulting in lower costs and faster drilling time; and
- Improved accuracy, an important consideration when drilling at the tighter Measured and Indicated spacing where hole deviations must be minimised.

#### Underground sampling

Large sections of mineralised skarn material are intersected within the 18 kilometres of existing underground development. Eagle Mountain is planning an extensive underground sampling program to:

- Channel sample the mineralised skarn (results of which can be used for future MRE updates);
- Map and model the structures that control mineralisation, again benefitting future MREs; and
- Provide bulk samples for large metallurgical tests such as crushing and grinding, blending, optimising
  recovery of copper, silver and gold and possible recovery of by-products such as magnetite and
  garnet. Just as important will be assessing how actual grades of bulk samples compare to the
  estimated local MRE grade.

It is likely that underground sampling could commence before underground drilling.

## **Project Development Activities**

#### Underground Refurbishment

The Company has engaged an experienced mining contractor, GMS Mine Repair & Maintenance, and a former Mine Safety Health and Administration (MSHA) Inspector as our mine safety specialist, to bring the underground and surface infrastructure up to the required safety and operational standards. This is to comply with the local mining regulations due to the Oracle Ridge mine transitioning from an exploration only status to an active, non-producing status.

The contractor is currently on site and working to re-establish power and ventilation to the mine. Maintenance of the electrical infrastructure is ongoing including the transformer, high-voltage cables and power station. A generator has been leased and delivered to site, ready to power the electrical system after maintenance is completed. The primary and auxiliary fans will also undergo major maintenance to ensure all components are in good working order and replaced if needed. It is currently expected that the mine will be energised before the end of August.

Following this initial phase, the contractor will commence actual underground work by testing the existing ground support infrastructure and repairing or augmenting it as required. Specific attention will be devoted to drill stations where additional ground support will be installed. Several of the planned drill stations were actively used in the most recent underground drilling program completed by previous owners in 2014. It is expected that only minimal work will be required at these drill sites.

Following establishment of initial drill stations, the underground drill rig is expected to commence early in Q4 2022. Subsequently, the refurbishment and drilling program will continue in parallel. It is currently expected that the underground refurbishment will take between three to six months, depending on the amount of new or additional ground support required.

Photo 2 - Existing equipment being serviced

### Metallurgy

The metallurgy of the Project has been significantly de-risked by actual production in the early 1990s when a saleable, clean copper-silver-gold concentrate was produced. The mine did encounter some processing challenges due to the lack of comprehensive studies covering different types of skarn mineralisation and poor crushing and grinding processes. During the 2010-2015 period, the previous owners of the project completed additional testwork which highlighted favourable copper, silver and gold recoveries.

The Company has engaged a metallurgist to review the historical production records and metallurgical studies and to recommend additional work to confirm and possibly improve on the previous results. This work will focus on:

- Completing initial metallurgical studies on Talon area mineralisation;
- Reviewing the different mineralogical characteristics of the different skarn and mineralisation styles
  across the mine. Due to the intrinsic variability of skarn mineralisation, it is important to understand
  the unique metallurgical characteristics of each area of the mine to assist with mine scheduling and
  processing down the track;
- Reviewing and optimising crushing and grinding requirements as the early 1990s mill carried up to a 50% recirculating load;
- Reviewing the potential presence of minerals or deleterious elements which could impact processing or concentrate saleability. As discussed above, based on previous processing and concentrate sales it is expected these will not be an issue;
- Evaluating the viability of recovering additional by-product minerals such as magnetite and garnet; and
- Assessing the potential benefits of ore sorting technology to reduce the material to be processed and, consequently, mill size and capital costs.

#### Water

While Arizona is a dry and hot state, it is endowed with substantial underground water resources. As part of the preliminary work to ensure a pathway to production, the Company is planning hydrogeological studies to identify sources of water for a potential mining operation. A consultant will be engaged to review existing information on geology and hydrology of the area, including water production from existing and historical water wells. After this desktop review, it is expected that one to three suitable sites will be proposed for the drilling of test wells.

Historical wells in the area have returned production rates capable of supporting a mine operation of the size currently envisioned at Oracle Ridge.

#### Permitting

Several permits required to recommence mining operations are already in place at Oracle Ridge, including Right of Way, Air Quality Permit and Aquifer Protection Permit. These permits were issued to the previous owners of the Project. Notwithstanding the requirement for revisions in the future, these existing permits are highly valuable as they show a successful history of approval with the local regulatory authorities. Specific support for the development of the Project was also obtained from Pima County in 2012.

As a result, the Company is keeping these permits active by engaging with the relevant authorities as they become due for renewal. The Company has also engaged an external consultant to review the permit status

of the Project and provide recommendations on the best way forward to initiate applications for permits which have not yet been obtained.

#### **COMPETENT PERSON STATEMENT**

The information in this document that relates to new Exploration Activities is based on information compiled by Mr Fabio Vergara and Mr Brian Paull who are both Members of The Australasian Institute of Mining and Metallurgy (MAusIMM) and have sufficient experience relevant to the activity which they are undertaking to qualify as a Competent Persons as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code 2012). Mr Vergara is the Chief Geologist and Mr Paull is the Director of Exploration of Eagle Mountain Mining Limited and both consent to the inclusion in this document of the information in the form and context in which it appears. Mr Vergara and Mr Paull hold shares and options in Eagle Mountain Mining Limited.

Where the Company references historic exploration results including technical information from previous ASX announcements including 25 May 2020, JORC Table 1 disclosures are included within them. The Company confirms that it is not aware of any new information or data that materially affects the information included in those announcements, and all material assumptions and technical parameters underpinning the results within those announcements continue to apply and have not materially changed. In addition, the form and context in which the Competent Persons findings are presented have not been materially modified from the original reports.

The information in this report that relates to historic production results was prepared and first disclosed under a pre-2012 edition of the JORC Code. The data has been compiled but NOT validated by Eagle Mountain geologists. At this stage, Eagle Mountain is unable to conclude that the production data is reliable. However, nothing has come to the attention of Eagle Mountain that causes it to question the accuracy or reliability of the historic production results and the various source reports.

#### ABOUT EAGLE MOUNTAIN MINING

Eagle Mountain is a copper-gold explorer focused on the strategic exploration and development of the Oracle Ridge Copper Mine and the highly prospective greenfields Silver Mountain Project, both located in Arizona, USA.

Arizona is at the heart of America's mining industry and home to some of the world's largest copper discoveries such as Bagdad, Miami and Resolution, one of the largest undeveloped copper deposits in the world.

# JORC Code, 2012 Edition - Table 1

# Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul> <li>Diamond drilling. Nominal sampling interval of 3m adjusted as required for local geological conditions. Core was sawn and half-core was crushed, pulverised and split to produce a representative sample for assaying.</li> <li>For WT-series drilling, samples returning weighted average Cu ≥ 1% are reported in the announcement. Wider intercepts are reported using a 0.6% Cu cut-off grade.</li> <li>For GE-series drilling, samples returning weighted average Au ≥ 0.5g/t or Cu ≥ 1% are reported in the announcement.</li> <li>Visual results presented are based on geological observations, and for WT-series drilling consider the copper content of different sulphide species at a 0.6% Cu nominal cut-off.</li> </ul>
Drilling techniques	<ul> <li>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul> <li>Diamond drilling completed by Boart Longyear using an LF-90 drill rig.</li> <li>Core is HQ3 and PQ3</li> <li>Downhole deviation surveys are performed approximately every 30.5m (100 feet)</li> <li>The core is oriented with a Boart Longyear Truecore™ system to allow measurement of structural information.</li> </ul>
Drill sample recovery	<ul> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul> <li>Core recoveries are recorded by the drillers at the rig and verified by Company's personnel during core logging</li> <li>To maximise sample recovery and core quality drilling is performed with a "triple tube" set up where two splits are inserted in the barrel to minimize core displacement and core loss.</li> <li>No relationship has been determined between sample recoveries and grade.</li> </ul>

Criteria	JORC Code explanation Commentary
Logging	<ul> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> <li>A quick log is completed on site and detailed logging is performed at the Company's facility in Tucson.</li> <li>Logging is both qualitative and quantitative in nature. Portable XRF and magnetic susceptibility measurements are taken at regular intervals on the core.</li> <li>Core is photographed after mark-up, before sampling, wet and dry</li> <li>100% of the relevant intersections is logged.</li> </ul>
Sub-sampling techniques and sample preparation	<ul> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> <li>ALS Minerals or Skyline Assayers and Laboratories at their Tucson facilities. Half of the core is bagged and sent for assaying while the other half is left in the core box for future reference.</li> <li>Company-owned automatic core saw. Half of the core is bagged and sent for assaying while the other half is left in the core box for future reference.</li> <li>A cut line is drawn by a geologist to guide sawing and sampling of intervals where sample bias might occur (e.g. mineralised vein at small angle to core axis).</li> <li>ALS Minerals or Skyline Assayers and Laboratories conducted all preparation work: samples were weighed, dried, crushed and crushed to better than 70% passing 2mm; sample was split with a riffle splitter and a split of up to 250g pulverised to better than 85% passing 75µm.</li> <li>Duplicates are used to assess the sampling representativeness. When duplicates are collected the core is quartered: one quarter is sent to the laboratory as the duplicate and the remaining half of the core is left in the box for future reference.</li> <li>Sample sizes are considered appropriate to the grain size of the material being sampled.</li> </ul>
Quality of assay data and laboratory tests	<ul> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors</li> <li>ALS Minerals assay methods: ME-MS61 (48 element four acid ICP-MS) and Au-AA23 (Au 30g charge Fire Assay with Atomic Absorption finish). The technique is considered a near total digest of relevant minerals. Above detection samples are re-assayed with Au-GRA21, Ag-OG62, Cu-OG62, Pb-OG62, Zn-OG62</li> <li>Skyline Assayers and Laboratories methods: TE-5 (47 element</li> </ul>

Criteria	JORC Code explanation	Commentary
	<ul> <li>applied and their derivation, etc.</li> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	<ul> <li>multi acid digestion with ICP-MS) and FA-01 (Au Fire Assay with Atomic Absorption finish). The technique is considered a near total digest of relevant minerals.</li> <li>Certified Reference Material (CRM), blanks and duplicates were inserted/collected at a ratio of 1:10 with a minimum of 1 CRM per assays batch. CRMs are inserted at intervals never exceeding 20 samples. Acceptable levels of accuracy and precision have been established.</li> <li>Before releasing results from geological observations (e.g. visual mineralisation), the Company adopts the following QA/QC procedures: <ul> <li>Core is dispatched to the laboratory and cut. Samples are bagged, crushed and pulverised (sample preparation)</li> <li>After sample preparation is finalised, a sub-sample is returned to the Company while assays are being completed at the laboratory</li> <li>Returned sub-samples are analysed with the Company's portable XRF instrument</li> <li>Portable XRF readings are compared with the visual logs</li> <li>Visual results are approved for release to the market</li> </ul> </li></ul>
Verification of sampling and assaying	<ul> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>Discuss any adjustment to assay data.</li> </ul>	<ul> <li>Significant intersections have been verified by Company's Principal Geologist</li> <li>No twinned holes reported</li> <li>Logging and sampling data are collected using tablet computers and Logchief software to ensure data integrity. The data is transferred weekly to the Datashed database after further data validation by the database manager</li> <li>No assay adjustment performed</li> </ul>
Location of data points	<ul> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>	<ul> <li>NAD83 Arizona State Plane Central (International feet). Data is presented in NAD83 UTM Zone 12N (meters)</li> <li>National Elevation Dataset. Horizontal resolution of approximately 10m and vertical resolution of 1m</li> <li>Drill holes are located with a hand-held GPS with an estimated horizontal accuracy of ±5m. Collar location is subsequently recaptured using a DGPS system with an estimated accuracy of ±0.5m</li> </ul>
Data spacing and distribution	<ul> <li>Data spacing for reporting of Exploration Results.</li> <li>Whether the data spacing and distribution is sufficient to establish</li> </ul>	The data spacing of the new drilling results reported is insufficient to establish the degree of geological and grade continuity

Criteria	JORC Code explanation	Commentary
	<ul> <li>the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>Whether sample compositing has been applied.</li> </ul>	appropriate for Mineral Resource estimation
Orientation of data in relation to geological structure	<ul> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	The relationship between drilling orientation and orientation of key mineralised structures is yet to be determined
Sample security	The measures taken to ensure sample security.	<ul> <li>Core boxes are collected at the drill rig by Company personnel and transported to the Tucson logging facility. After logging the core is delivered by Company personnel to ALS Minerals' Tucson facilities for cutting, sampling, sample preparation and assaying.</li> </ul>
Audits or reviews	<ul> <li>The results of any audits or reviews of sampling techniques and data.</li> </ul>	<ul> <li>No audits or reviews of sampling techniques have been completed.</li> </ul>

# Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul> <li>The Oracle Ridge Mine Project (Project) is located in the Marble Peak area, approximately 30 kilometres by air northeast of Tucson, Arizona, U.S.A. It is located in Sections 17, 18, 19 and 20 of Township 11 South, Range 16 East, Gila and Salt River Base and Meridian of the U.S. cadastral system. The geographical coordinates are approximately Latitude 32°28' North, Longitude 110°41' West.</li> <li>The Project is 100% owned by Eagle Mountain Mining Limited through its Arizona subsidiaries Wedgetail Operations LLC (100%) and Wedgetail Holdings LLC (100%).</li> <li>The Project consists of four main areas: Oracle Ridge, OREX, Golden Eagle and Red Hawk.</li> <li>Oracle Ridge (including historical Tailings Storage Facility)</li> </ul>
		<ul> <li>Oracle Ridge comprises 57 Patented Mining Claims and 45 Unpatented Mining Claims within the Coronado National Forest (United States Forest Service).</li> <li>100% of the mineral rights starting from 15.2m (50 feet) below surface are owned by Wedgetail Operations LLC</li> <li>In 2009, the surface rights for the area necessary for potential mining access (e.g. portals), processing facilities and offices have been secured by an industrial property lease. Under the agreement, Wedgetail Operations LLC leases the surface rights to the project for the purpose of carrying out its exploration, potential development and mining. The lease has an initial term of three years and is renewable for nine additional extensions of three years each.</li> </ul>
		<ul> <li>A separate surface access agreement is in place to allow access to drill sites and drill pads construction.</li> <li>The mineral rights of Patented Claims at Oracle Ridge are likely to have a reversionary interest to Marble Mountain Ventures, which have a reversionary interest to Marble Mountain Ventures, which have a reversional to the Company exercises its.</li> </ul>
		occurs on 18 February 2025, unless the Company exercises its Extension Option upon which the Company's interests in the mineral rights are extended to 18 February 2040.  • There is a 3% net smelter returns royalty on the future sale of any metals and minerals derived from the Oracle Ridge mine

Criteria	JORC Code explanation	Commentary
		OREX
		<ul> <li>The OREX area is covered by 93 Unpatented Mining Claims within the Coronado National Forest (United States Forest Service).</li> <li>100% of the mineral rights are owned by Wedgetail Operations LLC</li> <li>The OREX area is also partly covered by Patented Mining Claims controlled by Pima County. The Company has an agreement in place for non-ground disturbing exploration work to occur on Pima County's Patented Mining Claims. The Company does not currently control the Mineral Rights over Pima County's claims Golden Eagle</li> </ul>
		<ul> <li>The Golden Eagle area is covered by 3 Patented Mining Claims and 32 Unpatented Mining Claims within the Coronado National Forest (United States Forest Service).</li> <li>100% of the mineral rights are owned by Wedgetail Operations LLC</li> <li>The Golden Eagle area is also partly covered by Patented Mining Claims controlled by Pima County. The Company has an agreement in place for non-ground disturbing exploration work to occur on Pima County's Patented Mining Claims. The Company</li> </ul>
		does not currently control the Mineral Rights over Pima County's claims  Red Hawk
		<ul> <li>The Red Hawk area is covered by 24 Unpatented Mining Claims within the Coronado National Forest (United States Forest Service).</li> </ul>
		<ul> <li>100% of the mineral rights are owned by Wedgetail Operations LLC</li> <li>The land tenure is secure at the time of reporting and there are no linear processing the content of th</li></ul>
Exploration do	• Acknowledgment and appraisal of exploration by other parties.	known impediments to obtaining permits to operate in the area.  Oracle Ridge
by other partie		The Oracle Ridge Mining District was discovered in 1873. In 1881, an 18 tonne per day copper smelter was erected at nearby Apache Camp. The ore for this smelter was supplied from the Hartman, Homestake, Leatherwood, Stratton, Geesman and other small mines in the area.

Criteria	JORC Code explanation	Commontary
Criteria	JOKC Code explanation	Commentary
		<ul> <li>Phelps Dodge Copper Company (Phelps Dodge) entered the District in 1910 and undertook considerable development and exploration work.</li> <li>Continental Copper, Inc began exploring in the District in the 1950s. Continental leased the property in 1968 with an option to purchase and undertook a large exploration and development program. This was the first time there was a large scale assessment of the mineralisation.</li> <li>Union Miniere began a new exploration program in April 1980. In 1984, a feasibility study for an 1,814 short ton per day operation was completed.</li> <li>In October 1988, South Atlantic Ventures acquired Union Miniere's interest and entered into a 70-30 partnership with Continental to develop the mine. Minproc Engineers Inc. was contracted to supervise the confirmatory metallurgical test work. A detailed design was started in November 1989 on a column flotation plant. Construction of the facility commenced in April 1990 and the first ore was processed through the plant on March 3, 1991. The capacity of the mill was initially set at 771 short ton per day. The mill capacity was later expanded to approximately 1,000 short ton per day.</li> <li>The mine closed in 1996. Production records show that approximately 1,200,000 short tons were milled since commencement of the operation.</li> <li>Between 2009 and 2015 the project was owned by Oracle Ridge Mining, a TSX-V listed company, which drilled approximately 130 surface and underground holes.</li> <li>Golden Eagle</li> </ul>
		<ul> <li>Small scale mining occurred in the Golden Eagle area in the first half of the 1900s focussed on gold. The largest operation was the Sanderson Mine. The mine is part of the Golden Eagle mineralised system but is located outside the Company's landholding. It reported smelter returns between 1936 and 1941 averaging 0.4 Oz/short ton Au (13.7 g/t Au), 0.65 Oz/ton Ag (22.3 g/t Ag) and 0.46% Cu (small tonnage).</li> <li>Oracle Ridge mining conducted exploration at Golden Eagle in the mid-1990s. A geophysical magnetic survey was flown over the area. Few magnetic anomalies, postulated to be magnetite-rich</li> </ul>

skarn were tested by reconnaissance drilling. Results were not deemed sufficiently encouraging and no further drilling was conducted in the area.  REX  Details of historical (pre-1980s) exploration and mining activities in the OREX area are not known. Few small-scale workings were found during mapping.  In 1980 a Joint Venture between Gulf Minerals Corporation and
the OREX area are not known. Few small-scale workings were found during mapping. In 1980 a Joint Venture between Gulf Minerals Corporation and
W.R. Grace Company completed mapping of the area and drilled 7 holes. Results of the program were reviewed by Oracle Ridge Mining Partners and summarised in an internal communication in 1992.
ed Hawk
No historical exploration nor mining activities are known for the Red Hawk area
The deposit is classified as copper dominated skarn. Minerals representative of both prograde and retrograde skarn development are present, the former being represented by diopside and garnets, the latter by epidote, magnetite and chlorite. Copper dominated mineralisation generally contain chalcopyrite and bornite. The deposits are most commonly associated with Andean-type plutons intruded in older continental-margin carbonate sequences. The associated intrusive rocks are commonly porphyritic stocks, dikes and breccia pipes of quartz diorite, granodiorite, monzo-granite and tonalite composition, intruding carbonate rocks, calcareous-volcanic or tuffaceous rocks. The deposits shapes vary from stratiform and tabular to vertical pipes, narrow lenses, and irregular zones that are controlled by intrusive contacts.  The copper rich skarn deposits at Oracle Ridge are found in conformable lens along the contact with the Leatherwood Granodiorite or associated with faults and shear zones which intersect the Leatherwood. These have acted as feeders into the reactive carbonate horizons. The latter can form a "Christmas Tree" type shape.

Drill hole Information	<ul> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:         <ul> <li>easting and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> <li>hole length.</li> </ul> </li> <li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should</li> </ul>	deposit type for Golden Eagle is ongoing. The majority of elevated gold and base metals (copper, lead, zinc) from drill results are hosted within granitic rocks. These granites are bounded by what are interpreted to be younger intrusive rocks to the east and schists to the west.  • The gold-rich system is proximal to the lithological contact between the granites and younger intrusion. Although not visible in core, the gold is coincident with increased brecciation and oxidation. The base metal or polymetallic system occurs within the granites and occur as disseminations and veinlets.  • See body of announcement including Attachment 1.
Data aggregation methods	<ul> <li>clearly explain why this is the case.</li> <li>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>	<ul> <li>For WT-series drilling, exploration results are reported as weighted averages of assays equal or above a 1% copper cut-off. Lower grade intersections are reported as weighted averages of assays equal or above a 0.6% copper cut-off. Intersections start and end at a sample at or exceeding the specified cut-off.</li> <li>For GE-series drilling, exploration results are reported as weighted averages of assays equal or above a 0.5g/t gold cut-off or 1% copper cut-off. Intersections start and end at a sample at or exceeding the specified cut-off.</li> <li>No metal equivalents reported</li> </ul>
Relationship between mineralisation widths and intercept lengths	<ul> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> <li>If it is not known and only the down hole lengths are reported, there</li> </ul>	All intervals reported are down hole length. True widths are not known at this stage.

Criteria	JORC Code explanation	Commentary
	should be a clear statement to this effect (eg 'down hole length, true width not known').	
Diagrams	<ul> <li>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	See body of announcement
Balanced reporting	<ul> <li>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</li> </ul>	All exploration results obtained so far have been reported.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	No other meaningful and material exploration data beyond this and previous ASX announcements by the Company
Further work	<ul> <li>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> <li>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li> </ul>	<ul> <li>Further work will include interpretation of logging and assay results when they become available. Additional drill holes will be completed at Oracle Ridge in the coming weeks.</li> </ul>
