

Ongoing drilling at Challenger's Hualilan Gold Project continues to significantly extend the high-grade mineralisation

Highlights

Drilling, designed to increase the maiden Hualilan Mineral Resource, at the Verde Zone and Magnata Fault continues to extend mineralisation. Results reported in this release include:

•	18.8m at 6.3 g/t AuEq ¹ 3.4m at 11.5 g/t AuEq ¹ 7.4m at 10.8 g/t AuEq ¹	 4.5 g/t Au, 22.3 g/t Ag, 3.3% Zn from 344.4m including 8.9 g/t Au, 42.5 g/t Ag, 4.5% Zn from 344.4m and 7.4 g/t Au, 36.8 g/t Ag, 6.3% Zn from 355.8m (GNDD-642);
•	11.0m at 9.1 g/t AuEq ¹	- 9.0 g/t Au, 5.7 g/t Ag from 356.0m including
	7.8m at 12.6 g/t AuEq ¹	- 12.5 g/t Au, 7.9 g/t Ag from 356.0m (GNDD-571);
•	46.0m at 1.7 g/t AuEq ¹	- 1.2 g/t Au, 4.4 g/t Ag, 0.9% Zn from 367.0 including.
	3.9m at 7.9 g/t AuEq ¹	 7.3 g/t Au, 18.7 g/t Ag, 0.7% Zn from 380.3m and
	5.1m at 6.6 g/t AuEq ¹	- 3.7 g/t Au, 19.7 g/t Ag, 5.9% Zn from 400.8m(GNDD-633)
•	24.7m at 2.8 g/t AuEq ¹	- 2.3 g/t Au, 6.4 g/t Ag, 1.0% Zn from 236.0m including
	1.2m at 45.3 g/t AuEq ¹	- 36.2 g/t Au, 92.1 g/t Ag, 17.3% Zn from 259.5m and
	0.9m at 26.7 g/t AuEq ¹	- 24.9 g/t Au, 15.3 g/t Ag, 3.5% Zn from 375.0m and
	2.3m at 7.5 g/t $AuEq^1$	- 3.3 g/t Au, 30.1 g/t Ag, 8.2% Zn from 417.6m (GNDD-604);
•	18.1m at 2.6 g/t AuEq ¹	- 2.3 g/t Au, 2.8 g/t Ag, 0.5% Zn from 281.4m including
	1.0m at 34.0 g/t AuEq ¹	- 32.6 g/t Au, 18.1 g/t Ag, 1.9% Zn from 289.7m and
	87.0m at 0.7 g/t AuEq ¹	- 0.7 g/t Au, 1.4 g/t Ag, from 314.0m (GNDD-588);

- Drilling continues to show no sign that it is nearing the limits of the mineralisation, which remains open in all directions.
- Additionally, the majority of infill drilling continues to achieve grades either above or in line with the current resource block model.

Commenting on the first drilling results after the resource, CEL Managing Director, Mr Kris Knauer, said

"These results are a prime example of why we have increased the planned drill program at Hualilan by 50,000 metres following last week's \$25 million financing by two leading resource investors.

This series of results are from the Verde Zone and Magnata Fault and several of these holes have extended the mineralisation by 200 metres and we are seeing no sign we are getting close to the limits of the deposit.

When we released our maiden Resource Estimate at Hualilan it was very much an interim and we expected it to increase significantly. It was based on 126,000 metres of a planned 254,000 metres of drilling and 2.2 of 3.5 kilometres strike. These results continue to support this expectation."

¹ Reported as Gold Equivalent (AuEq) values – for requirements under the JORC Code see page 22

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 1,044.9m shares 10m options 120m perf shares 16m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 Directors Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman Mr Sergio Rotondo, Exec. Director

Challenger Exploration (ASX: CEL) ("CEL" the "**Company**") is pleased to announce results from drilling at its flagship Hualilan Gold Project, San Juan Argentina. The results are from the Company's ongoing drill program targeting extensions to the current 2.1 million ounce AuEq¹ Mineral Resource Estimate ("**MRE**")². The holes reported in this release are primarily targeting extensions to the Verde and Gap Zone mineralisation. The drilling continues to show the presence of coherent zones of significantly higher-grade mineralisation at depth in the Verde Zone.

All results were received after the completion of the Company's maiden Hualilan Gold Project MRE. These results, and the remaining 29,000 metres of assays that remain pending from the recently completed 204,000 metre drill program, will be included in an updated MRE. The current MRE, which includes a high-grade core of 1.1 Moz at 5.6 g/t AuEq¹, was based on 125,700 metres of the Company's 204,000 metre diamond core drill program. Following the completion of the \$24.7 million dollar financing (see ASX release dated 9 September 2022) the Company has committed to a further 50,000 metres of drilling which will take total CEL drill metres at Hualilan to 254,000 metres.

The results continue to exceed the Company's expectations and confirm that mineralisation remains open in all directions and there is clear potential for the MRE to grow significantly via continued extension drilling. A summary of selected significant intercepts reported in this in this ASX Release and their impact on the mineralisation is given Table 1 below.

Drillhole	Intercept (AuEq)	Comment	Gram x Metres
GNDD-626	32.3m at 0.8 g/t AuEq	extends Verde mineralisation 25m up-dip of MRE boundary	25.8
GNDD-629	98.0m at 0.4 g/t AuEq inc 2.9m at 4.1 g/t AuEq	located approximately 400 metres north-west of the current MRE boundary	42.5 11.8
GNDD-554	46.1m at 0.9 g/t AuEq and 24.0m at 0.9 g/t AuEq	extends mineralisation 200 metres below the MRE boundary and intersected significantly higher-grade than MRE model	39.5 21.9
GNDD-591	14.0m at 1.2 g/t AuEq and 3.3m at 5.4 g/t AuEq	extends mineralisation 80 meters downdip of MRE boundary extends mineralisation 100 metres along strike	17.4 17.7
GNDD-570	22.2m at 0.9 g/t AuEq	extends Verde mineralisation 80 metres up-dip of MRE boundary	20.2
GNDD-612	97.6 metres at 0.8 g/t AuEq	intersection much thicker than MRE block model	78.1
GNDD-604	24.7m at 2.8 g/t AuEq and 0.9m at 26.7 g/t AuEq		
GNDD-571	11.0m at 9.1 g/t AuEq inc 7.8m at 12.6 g/t AuEq	extends Verde Zone 40 metres downdip of the MRE boundary and intersected significantly higher grade than MRE model	100.1 98.6
GNDD-577	17.0m at 1.6 g/t AuEq and 0.6m at 32.0 g/t AuEq	new zone of mineralisation above the main Verde Zone extends mineralisation 200 metres downdip of MRE boundary	27.5 17.6
GNDD-633	46.0m at 1.7 g/t AuEq and 71.0m at 0.4 g/t AuEq and 30.0m at 0.8 g/t AuEq	extends Verde mineralisation 40 metres below MRE boundary new zone of near surface mineralisation within \$1800 pit shell new zone of near surface mineralisation within \$1800 pit shell	76.5 26.2 25.0
GNDD-588	18.1m at 2.6 g/t AuEq and 87.0m at 0.7 g/t AuEq		
GNDD-642 GNDD-595	18.8m at 6.3 g/t AuEq 21.2m at 0.7 g/t AuEq and 39.8m at 0.5 g/t AuEq	extended high-grade mineralisation 40 metres up-dip extends mineralisation 40 metre below MRE boundary	119.3 15.0 18.8

HIGHLIGHTS

CURRENT MRE

Table 2 shows the contribution to the maiden 2.1Moz AuEq² MRE by domain. While drilling has been ongoing in all domains as mineralisation remains open in all directions, the majority of the drilling, following the completion of the maiden Hualilan MRE, has been focussed in five areas.

- 1. **The Magnata Fault:** where high-grade mineralisation remains open in both directions along strike and at depth
- 2. **Sentazon:** where in addition to the mineralisation remaining open to the south along strike a significant new high-grade discovery has been made at depth
- 3. Verde Zone (at Depth): where a significant new high-grade skarn/endoskarn zone is emerging down dip of parts of the Verde Zone
- 4. Verde Zone (north): where drilling continues to extend the mineralisation north along strike and at depth with mineralisation open in both these directions
- 5. **South Verde:** where drilling continues to extend the Verde Zone south of the Magnata Fault along strike and at depth with mineralisation open in both these directions

The results reported in this ASX Release comprise the first half of the Verde, Southern Verde, and Gap Zone drilling completed post the release of the maiden and interim MRE. This release also includes the results for the first holes targeting extensions on the Magnata Fault for which assays have been received. Results for the majority of the Magnata Fault, Sentazon and Sentazon Deeps, Sanchez Fault and the deeper high-grade zones within Verde remain pending.

Domain	Tonnes	ʻ000 oz AuEq ¹	Comments
Sanchez Fault	673,754	87,212	Open at depth and to the east
Norte Manto	510,533	97,954	Open north along strike
Magnata Fault	4,309,440	406,521	Open to the east and west and at depth (Drilling Focus)
Magnata Manto	571,746	63,106	Open up dip and along strike
Muchilera Manto	299,504	18,532	Open along strike and at depth
Sentazon MM and FW	1,967,110	334,655	Significant depth extensions, open south (Drilling Focus)
Verde Skarn Zones	2,151,908	177,503	Open at depth and along strike (Drilling Focus)
Skarn Mineralisation	10,483,995	1,185,484	Sub-total (high grade skarn domains)
Verde	17,472,119	470,233	Open at depth and north along strike (Drilling Focus)
Gap Zone	5,063,971	140,228	Open at depth and along strike
South Verde	14,654,682	336,855	Open at depth and south along strike (Drilling Focus)
Intrusion/Sediment-hosted	37,190,772	947,316	Sub-total (intrusion/sediment-hosted domains)
Total MRE	47,674,767	2,132,800	(Refer Table 3, 4, page 24 of this Release for additional data)

THE VERDE ZONE

The Verde Zone contributes almost 1 million ounces gold equivalent¹ (Table 2) to the current Hualilan MRE when the new high-grade zones at depth are included. The Verde Zone was a CEL discovery targeted using surface magnetics and IP (Induced Polarisation) at the Hualilan Gold Project. The discovery hole (ASX release 2/3/21) returned 125.5 metres at 1.1 g/t AuEq including 71.0 metres at 1.8 g/t AuEq (GNDD-169). The Verde Zone covers 2.0 kilometres of strike and mineralisation remains open along strike and at depth.

Mineralisation in the Verde Zone is oriented north-south, is 50 to 100 metres wide, and hosted by bedding parallel fault-fracture zones in sediments and steeply dipping fracture zones in intrusives. A lower grade halo of mineralisation extends into the overlying sedimentary rocks which have been locally brecciated by the hydrothermal fluids during mineralisation. The overlying mineralisation in the sedimentary rocks dips to the west at 30-50° and is up to 50 metres thick. This overlying halo of lower grade mineralisation is a useful exploration guide to vector to the deeper intrusion-hosted mineralisation. As drilling extends deeper, zones of high-grade skarn mineralisation are being intersected at both limestone-intrusive contacts and also within limestone which is analogous to the Main Norte and Sentazon Manto mineralisation.

The infill and extension drilling at the Verde and Gap Zones is designed as a series of fences of holes at 40 metre spacing along strike. Holes on each fence were collared to target the mineralisation 40 metres below the previous hole. The intention is to drill the entire 2.0 kilometre Verde Zone down to 400 metres vertically on 40 x 40 metre spacing . The infill portion of this program is ongoing as, mineralisation continues to be extended further north and south along strike, and at depth. Accordingly, the focus has been to continue expanding the footprint of the mineralisation rather than infill drilling. The results in this discussion are ordered from north to south along strike.

GNDD-570

GNDD-570 and GNDD-612 were collared on the northern most fence of drilling on the Verde Zone in an area that had seen limited drilling prior to the MRE cut-off date. GNDD-570 was collared to test 80 metres up-dip of GNDD-226 (16 metres at 0.6 g/t AuEq and 44.0 metres at 0.5 g/t AuEq), the most northerly Verde Zone intersection included in the current MRE.

The intersections in GNDD-570 of **22.2m at 0.9 g/t AuEq (0.6 g/t gold, 3.7 g/t silver, 0.4% lead, 0.4% zinc)** from 55.8m including **7.3m at 1.8 g/t AuEq (1.4 g/t gold, 9.0 g/t silver, 0.8% lead, 0.4% zinc)** and **10.0m at 0.4 g/t AuEq (0.3 g/t gold, 1.4 g/t silver, 0.2% zinc)** from 95.0m extend the Verde Zone mineralisation 80 metres up-dip of the current MRE boundary to near surface (Figure 1).

GNDD-612

GNDD-612 was drilled as an infill hole between GNDD-427 and GNDD-570 based on the mineralisation logged in GNDD-570. It intersected **35.3m at 1.2 g/t AuEq (0.9 g/t gold, 2.7 g/t silver, 0.3% lead, 0.5% zinc)** from 64.9 metres including **8.0 metres at 4.5 g/t AuEq (3.4 g/t gold, 8.4 g/t silver, 0.9% lead, 1.7% zinc)** and **14.0 metres at 1.1 g/t AuEq (1.0 g/t gold, 1.1 g/t silver, 0.2% zinc)** from 117.0m.

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 1,044.9m shares 10m options 120m perf shares 16m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 Directors Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman Mr Sergio Rotondo, Exec. Director

Additionally, GNDD-612 intersected a zone of deeper mineralisation with an intersection of 14.5 metres at 1.1 g/t AuEq (0.9 g/t gold, 6.3 g/t silver, 0.1% zinc) from 148.0 metres including 4.0 metres at 2.5 g/t AuEq (2.4 g/t gold, 4.7 g/t silver, 0.1% lead, 0.1% zinc).

These three intersections lie within a broad zone **of 97.6 metres at 0.8 g/t AuEq** (including internal dilution) confirming the continuity of the mineralisation and indicating that the Verde Zone has thickened considerably at this location. Additionally, the intersections are significantly higher-grade than the intersections in earlier drilling, confirming that the mineralisation at the northern limit of the Verde Zone remains strong and open to the north. Results for GNDD-680, collared to test 40 metres down dip of GNDD-427 are pending.

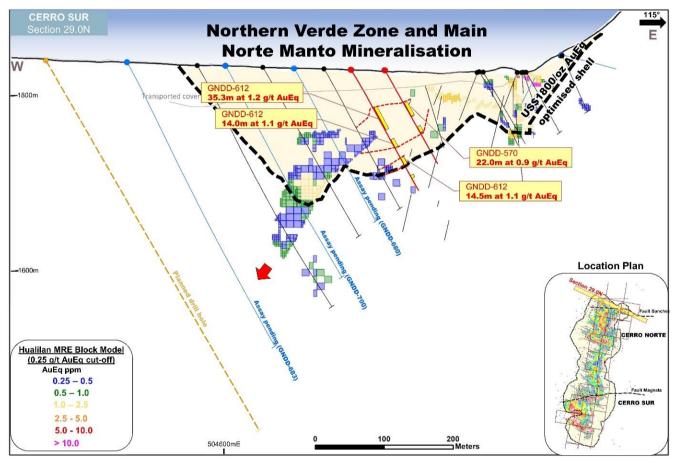

Figure 1 - Cross Section GNDD-570 and GNDD-612 Northern Verde Zone

GNDD-587 and GNDD-594, GNDD-711 (assays pending)

GNDD-587 and GNDD-594 were drilled on the fence of drilling 40 metres south of GNDD-570 and GNDD-612 where drilling is limited. They are part of a series of extension holes (some of which are still assays pending) collared as up and down-dip step-outs of GNDD-402 (37.0 metres at 0.3 g/t AuEq and 24.0 metres at 0.3 g/t AuEq) just inside the northern limit of the Verde Zone.

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 1,044.9m shares 10m options 120m perf shares 16m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 Directors Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman Mr Sergio Rotondo, Exec. Director

GNDD-587 intersected four zones of mineralisation including **35.0 metres at 0.3 g/t AuEq (0.2 g/t gold, 0.6 g/t silver, 0.1% lead, 0.1% zinc)** from 85.0m, including **1.6 metres at 1.5 g/t AuEq (1.1 g/t gold, 2.3 g/t silver, 0.4% lead, 0.7% zinc)** which extends the Verde Zone mineralisation 100 metres up-dip into a zone of no drilling. Additionally, the hole intersected **31.0 metres at 0.8 g/t AuEq (0.7 g/t gold, 1.9 g/t silver, 0.3% zinc)** from 182.0m including **5.8 metres at 3.0 g/t AuEq (2.3 g/t gold, 7.3 g/t silver, 1.4% zinc, 0.1% lead**). This deeper intersection extended the true width of the mineralisation by approximately 15 metres compared to the MRE block model.

GNDD-594 was effectively an infill hole between GNDD-587 and GNDD402 on a 40 metres spacing to allow the reporting of the MRE to indicated status. GNDD-594 confirmed the extension of the mineralisation between the two holes recording intercepts of **12.0 metres at 1.0 g/t AuEq (0.7 g/t gold, 1.8 g/t silver, 0.2% lead, 0.5% zinc)** from 104.0m including **2.0 metres at 3.9 g/t AuEq (3.1 g/t gold, 6.5 g/t silver, 1.5% zinc, 0.5% lead)** and **1.4 metres at 2.1 g/t AuEq (2.1 g/t gold, 0.3 g/t silver)** from 162.0m and **6.0 metres at 0.7 g/t AuEq (0.6 g/t gold, 3.3 g/t silver, 0.1% zinc)** from 198.0m.

GNDD-711 (assays pending) has been drilled as a test 80 metres downdip of GNDD-402 and has been logged as intersecting sulphides and skarn alteration. Accordingly, an infill hole is planned between GNDD-711 and GNDD-402.

Directors Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman Mr Sergio Rotondo, Exec. Director

GNDD-554 (Verde Zone)

GNDD-554 was collared on the next fence of drilling 40 metres south of GNDD-587 and GNDD-594 at the northern end of the Verde Zone. The hole intersected **46.1 metres at 0.9 g/t AuEq (0.8 g/t gold, 0.9 g/t silver, 0.1 % zinc)** from 259.9m, including **6.5 metres at 3.9 g/t AuEq (3.7 g/t gold, 2.6 g/t silver, 0.3 % zinc)** and **24.0 metres at 0.9 g/t AuEq (0.9 g/t gold, 0.8 g/t silver, 0.1 % zinc)** from 338.0m including **5.5 metres at 2.9 g/t AuEq (2.8 g/t gold, 1.9 g/t silver, 0.2 % zinc)**.

GNDD-554 confirmed both the continuity of, and that drilling is providing significant extensions to, the Verde Zone mineralisation. GNDD-554 was an infill hole between GNDD-422 (28.0 metres at 0.3 g/t AuEq and 64.0 metres at 0.4 g/t AuEq) and GNDD-459 (29.0 metres at 0.2 g/t AuEq and 43.0 metres at 0.5 g/t AuEq). GNDD-554 will allow the extension of the MRE between GNDD-422 and GNDD-549 which was not possible in the maiden MRE as the spacing between the holes had been too large (Figure 3). In addition to allowing the MRE to be extended across this 200 metre gap the intersections in GNDD-554 were significantly higher-grade than those in the surrounding holes.

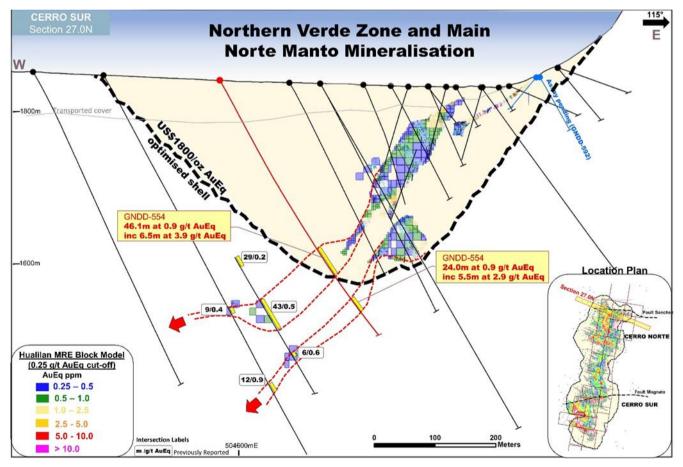

Figure 3 - Cross Section GNDD-554 Northern Verde Zone

GNDD-591

GNDD-591 was collared approximately 600 metres south of the Sanchez Fault in in a relatively lightly drilled section of the northern Verde Zone. The hole was collared to test 80 metres downdip of GNDD-

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 1,044.9m shares 10m options 120m perf shares 16m perf rights Australian Registered Office

Directors

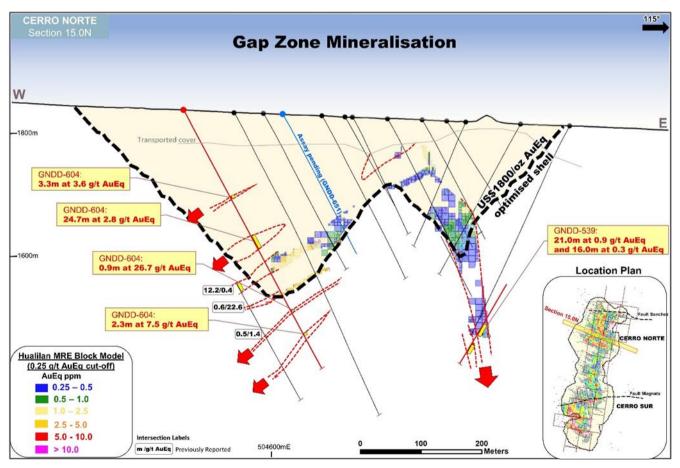

Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman Mr Sergio Rotondo, Exec. Director

242 (8.6 metres at 0.6 g/t AuEq and 0.7m at 2.3 g/t AuEq). The intersections of **14.0 metres at 1.2 g/t AuEq (1.2 g/t gold, 0.9 g/t silver)** from 224.0m including **2.8 metres at 4.5 g/t AuEq (4.4 g/t gold, 3.5 g/t silver, 0.1% zinc)** correlates with the intersections in GNDD242 and extends the Verde Zone mineralisation 80 metres downdip. Importantly, the mineralisation intersected in GNDD-591 is approximately 50% thicker and considerably higher-grade than surrounding holes.

GNDD-591 intersected several new zones of deeper mineralisation. The intersection of **4.0 metres at 2.0 g/t AuEq (1.7 g/t gold, 3.7 g/t silver, 0.4% zinc, 0.1% lead)** from 250.0m including **0.7 metres at 10.1 g/t AuEq (8.8 g/t gold, 17.7 g/t silver, 2.2% zinc, 0.4% lead)** is significant. This intersection extends a deeper zone of higher-grade Verde mineralisation that covers 200 metres of strike another 40 metres south along strike.

A third deeper intersection of **3.3 metres at 5.4 g/t AuEq (4.6 g/t gold, 12.4 g/t silver, 1.3% zinc)** from 382.0m including **0.7m at 23.8 g/t AuEq (20.5 g/t gold, 55.7 g/t silver, 5.6% zinc)** occurs in the same stratigraphic position as a series of high-grade intercepts in drill holes 100 metres south along strike and may represent the continuation of this zone of mineralisation into this relatively lightly drilled area of the project.

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 1,044.9m shares 10m options 120m perf shares 16m perf rights Australian Registered Office

1205 Hay Street West Perth WA 6005 Directors Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman Mr Sergio Rotondo, Exec. Director

GNDD-604

GNDD-604 was collared 40 metres south of GNDD-591 in the central Verde Zone and was drilled to test 80 metres downdip of GNDD-456 (12.4 metres at 2.8 g/t AuEq). GNDD-604 intersected 24.7m at 2.8 g/t AuEq (2.3 g/t gold, 6.4 g/t silver, 1.0% zinc) from 236.0m including 1.2m at 45.3 g/t AuEq (36.2 g/t gold, 92.1 g/t silver, 0.1% lead, 17.3% zinc) and 1.5m at 5.2 g/t AuEq (5.0 g/t gold, 3.4 g/t silver, 0.2% lead, 0.3% zinc). This intersection extends the main zone of Verde mineralisation 80 metres downdip from GNDD-456 with additional drilling planned down-dip of GNDD-604 as mineralisation remains strong and open at depth. Importantly this extension lies withing the current US\$1800 pit shell used for the initial MRE.

GNDD-604 also confirmed and extended deeper zones of high-grade mineralisation intersected in GNDD-591 and several holes along strike below the main Verde Zone mineralisation. These deeper intersections in GNDD-604 included **0.9m at 26.7 g/t AuEq (24.9 g/t gold, 15.3 g/t silver, 3.5% zinc)** from 375.0m, **2.3m at 7.5 g/t AuEq (3.3 g/t gold, 30.1 g/t silver, 8.2% zinc)** from 417.6m and **1.8m at 1.4 g/t AuEq (1.4 g/t gold, 0.1 g/t silver)** from 426.4m. These intercepts correlate with and extend intercepts in adjacent holes including 2.0 metres at 9.4 g/t AuEq, 0.9 metres at 10.8 g/t AuEq (GNDD-361), 0.6 metres at 22.6 g/t AuEq (GNDD-472), and 1.0 metres at 14.4 g/t AuEq (GNDD-367). This high-grade mineralisation now extends over 200 metres of strike.

GNDD-539

GNDD-539 was drilled in the central Verde Zone 120 metres south along strike from GNDD-604 and 700 metres south of the Sanchez Fault. The hole was oriented in the opposite direction to the majority of previous drilling as it was designed to test for extensions to the steeply east dipping Gap Zone mineralisation below the current MRE boundary. The hole intersected **21.0 metres at 0.9 g/t AuEq (0.9 g/t gold, 1.0 g/t silver)** from 373.0m. The intersection extended the Gap Zone mineralisation 100 metres deeper with mineralisation remaining open at depth.

GNDD571

GNDD-571 was drilled on the same fence of drilling as GNDD-539 however it was drilled 400 metres to the west and drilled eastwards as an infill hole in the central Verde Zone. GNDD-571 was drilled as an up-dip test of GNDD-368 (56.3m at 0.9 g/t AuEq including 5.5m at 5.6 g/t AuEq) with GNDD643 (assays pending) collared to test another 40 metres up-dip as part of the resource drill out (Figure 5).

The intersection of **11.0 metres at 9.1 g/t AuEq (9.0 g/t gold, 5.7 g/t silver, 0.1 % zinc)** from 356.0m, including **7.8 metres at 12.6 g/t AuEq (12.5 g/t gold, 7.9 g/t silver, 0.1 % zinc)** extends the Verde mineralisation 40 metres down dip from GNDD-368. Additionally, the intersection is considerably higher in grade than the existing MRE block model. GNDD-643 (assays pending) is logged as intersecting three zones of massive and semi massive sulphides and skarn alteration which could significantly extend this zone of high-grade mineralisation up-dip (Figure 5).

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 1,044.9m shares 10m options 120m perf shares 16m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 Directors Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman Mr Sergio Rotondo, Exec. Director

Additionally, GNDD-571 intersected **47.0 metres at 0.4 g/t AuEq (0.3 g/t gold, 1.1 g/t silver, 0.1 % zinc)** from 213.0m and **10.0 metres at 0.6 g/t AuEq (0.6 g/t gold, 0.5 g/t silver)** from 328.8m. Both these shallower intersections lie within the US\$1800 Pit Shell used for the MRE and expand the mineralisation expected to be able to be mined from surface.

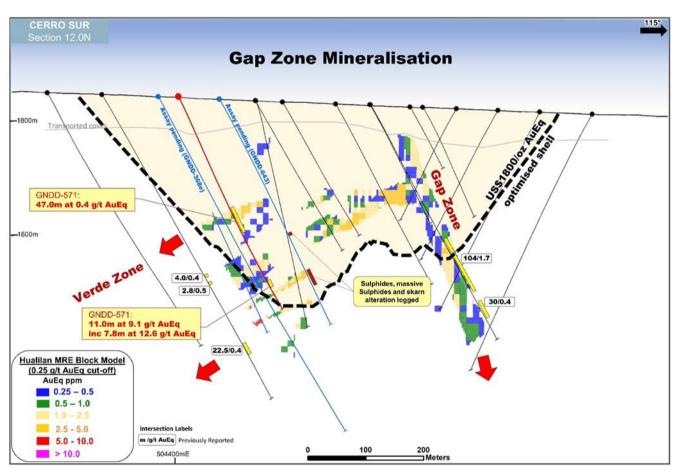

Figure 5 - Cross Section GNDD-571 Verde and Gap Zone mineralisation

GNDD-577

GNDD-577 was collared on the next fence of drilling 40 metres south of GNDD-570 as a 40 metre infill hole between GNDD-359 and GNDD-337. GNDD-577 intersected seven zones of mineralisation successfully extending the mineralisation. The first of intersection **17.0 metres at 1.6 g/t AuEq (1.6 g/t gold, 1.2 g/t silver, 0.1% lead, 0.1% zinc)** from 126.0m correlates with a zone of mineralisation intersected in GNDD-337 (7m at 0.5 g/t AuEq) and indicates significant increase in width and grade down dip. This mineralisation lies within the US\$1800 pit shell used for the current MRE.

The deepest of the seven zones of mineralisation produced an intersection of **0.6 metres at 32.0 g/t AuEq (22.8 g/t gold, 88.9 g/t silver, 17.6% zinc)**, located almost 200 metres below the current MRE boundary. This intercept continues the theme of intersecting higher grade mineralisation in the Verde Zone at the contacts between the intrusives and limestone due to this boundary being a pathway for

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 1,044.9m shares 10m options 120m perf shares 16m perf rights Australian Registered Office

the flow of mineralising fluids. Two additional holes GNDD-653 and GNDD-725 (both assays pending) have been completed to test downdip of GNDD-577 and the Company is planning for GNDD-359 to be re-entered and extended 200 metres deeper .

GNDD-633 and GNDD-546

GNDD-633 and GNDD-546 are located 40 metres south of GNDD-577 in the central Verde Zone. Prior to the intersection of 67.7 metres at 7.7 g/t AuEq in GNDD-458, the Company had only drilled two holes along this 200 metre strike section of the central Verde Zone. GNDD-633 was collared to test 40 metres down dip from GNDD-458. GNDD-633 extended the mineralisation intersected in GNDD-458 some 40 metres down dip with an intersection **46.0 metres at 1.7 g/t AuEq (1.2 g/t gold, 4.4 g/t silver, 0.9% zinc)** from 367.0 including **3.9 metres at 7.9 g/t AuEq (7.3 g/t gold, 18.7 g/t silver, 0.8% zinc)** from 380.3m and **5.1m at 6.6 g/t AuEq (3.7 g/t gold, 19.7 g/t silver, 5.9% zinc)**.

Additionally, GNDD-633 intersected three new zones of mineralisation up-dip intersecting **13.1 metres at 0.6 g/t AuEq (0.6 g/t gold, 0.8 g/t silver)** from 115.5m, **71.0 metres at 0.4 g/t AuEq (0.3 g/t gold, 0.6g/t silver)** from 147.0, and **30.0 metres at 0.8 g/t AuEq (0.8 g/t gold, 1.7 g/t silver, 0.1% zinc)** from 246.0m including **0.7 metres at 25.3 g/t AuEq (23.4 g/t gold, 46.4 g/t silver, 0.3% lead, 2.7% zinc)**.

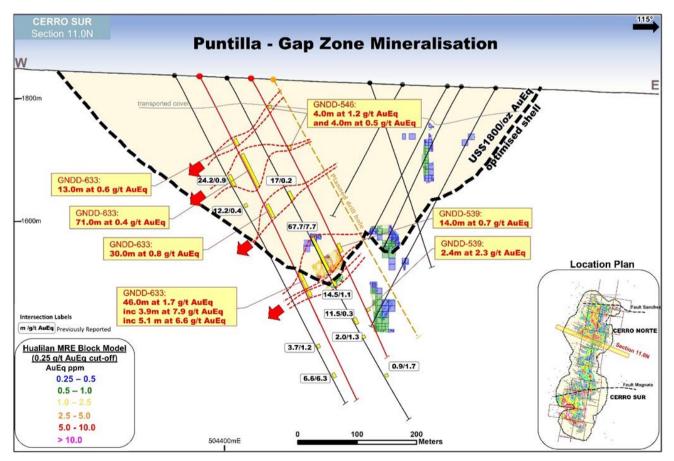

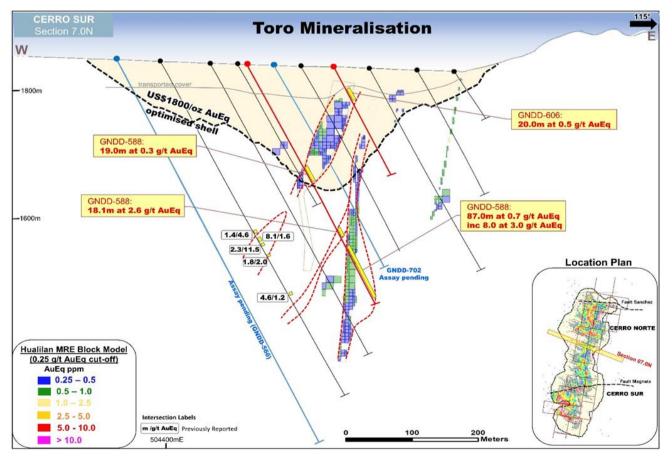

Figure 6 - Cross Section GNDD-633, GNDD-546 and GNDD-458 Central Verde Zone

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 1,044.9m shares 10m options 120m perf shares 16m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 Directors Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman Mr Sergio Rotondo, Exec. Director

As can be seen on Cross Section (Figure 6), which includes the block model for the maiden MRE, the intercept of 67.7 metres at 7.7 g/t AuEq in GNDD-458 was modelled conservatively in the maiden MRE due to the limited drilling. The intersection in GNDD-633 will allow this zone of mineralisation to be extended 40 metres down dip. The three shallower zones of mineralisation correlate with intersections in holes up and down dip and these new results will allow this mineralisation, that lies within the current US\$1800 pit shell to be included in the next MRE. An additional drill hole is planned to be collared to test 80 metres down-dip of GNDD-633.

GNDD-546 was drilled to test 40 metres up-dip of GNDD-458 and intersected **14.0 metres at 0.7 g/t AuEq (0.6 g/t gold, 1.8 g/t silver)** from 316.0m including **2.0 metres at 1.9 g/t AuEq (1.8 g/t gold, 2.9 g/t silver).** In GNDD-546 the intrusives that host the high-grade mineralisation intersected in GNDD-458 appear not to have extended up-dip with the intersection in GNDD-546 was hosted in limestones that have been baked; likely as they are adjacent to the intrusives that host the high-grade intersection down-dip. GNDD-546 Intersected two zones of mineralisation above this main zone intersecting **4.0 metres at 1.2 g/t AuEq (1.2 g/t gold, 0.3 g/t silver)** from 55.0m and **4.0 metres at 0.5 g/t AuEq (0.5 g/t gold, 0.4 g/t silver)** from 134.0. These intersections correlate with the new zones intersected in GNDD-633 80 metres downdip and are located within the \$1800 optimised pit shell.

GNDD-588 and GNDD-606

Figure 7 - Cross Section GNDD-588 and GNDD-606 Verde Zone

GNDD-588 is located 200 metres south of GNDD-633 in the Central Verde Zone. The hole was collared to test 15 metres up-dip of hole GNDD-303 and primarily targeted as a depth extension to GNDD-303 which was ended at 240 metres. This was subsequently interpreted to have been above the main zones of Verde mineralisation.

GNDD-588 intersected several zones of mineralisation. The intersection of **18.1 metres at 2.6 g/t AuEq (2.3 g/t gold, 2.8 g/t silver, 0.2% lead, 0.5% zinc)** from 281.4m including **1.0 metres at 34.0 g/t AuEq (32.6 g/t gold, 18.1 g/t silver, 1.6% lead, 1.9% zinc)** from 289.7m appears to be a new zone of mineralisation above the existing Verde Zone mineralisation (Figure 6 on preceding page). The intersection of **87.0 metres at 0.7 g/t AuEq (0.7 g/t gold, 1.4 g/t silver)**, from 314.0m including **8.0 metres at 3.0 g/t AuEq (2.9 g/t gold, 3.4 g/t silver)** and **10.0 metres at 1.3 g/t AuEq (1.2 g/t Au, 1.6 g/t silver, 0.1% zinc)** is interpreted as a north-east striking zone of Verde mineralisation below GNDD-303. The mineralisation intersected in this zone in GNDD-588 is considerable wider and contains higher-grade zones than in adjacent holes.

The intersection of **19.0 metres at 0.3 g/t AuEq (0.3 g/t gold, 0.7 g/t silver)** from 182.0m higher in the hole is the downdip extension of the near surface mineralisation intersected in GNDD-341 (110.4 metres at 0.5 g/t AuEq) and confirms its continuity 100 down-dip. Intersections of **7.0 metres at 0.6 g/t AuEq (0.6 g/t gold, 0.6 g/t silver)** from 213.0m and **12.0 metres at 0.3 g/t AuEq (0.2 g/t gold, 1.3 g/t silver, 0.1% lead, 0.2% zinc)** from 242.0m represent new zones of mineralisation.

GNDD-629

GNDD-629 is located 600 metres north of the Magnata Fault in the southern section of the Verde Zone. The hole was drilled as an infill hole between GNDD-295 (42.0 metres at 0.3 g/t AuEq) and GNDD-380 (22.0 metres at 0.4 g/t AuEq and 70.0 metres at 0.7 g/t AuEq). The hole intersected **98.0** metres at 0.4 g/t AuEq (0.4 g/t gold, 1.6 g/t silver, 0.1% zinc) from 117.0m including 2.0 metres at 2.0 g/t AuEq (1.9 g/t gold, 2.3 g/t silver, 0.1% zinc) and 2.9 metres at 4.1 g/t AuEq (3.1 g/t gold, 19.1 g/t silver, 0.3% lead, 1.4% zinc). The intersection is double the thickness of mineralisation intersected in GNDD-295 and will extend the mineralisation up dip in the MRE US\$1800 pit shell.

GNDD-538

GNDD-538 was collared just south of the Magnata Fault as a test for extensions to the Verde Zone 40 metres north along strike from GNDD-530 (54 metres at 0.4 g/t AuEq and 28.5 metres at 5.4 g/t AuEq; both hosted in intrusives) for which results were received after the MRE cut-off date. GNDD-538 extended these zones of intrusion-hosted mineralisation, which is the extension of the Verde Zone south of the Magnata Fault.

The hole produced several intersections, all of which are all outside the boundary of the current MRE. Results included 10.0 metres at 1.0 g/t AuEq (1.0 g/t gold, 0.7 g/t silver) from 176.0m and 2.0 metres at 3.1 g/t AuEq (3.1 g/t gold, 0.7 g/t silver) from 182.0m and 79.0 metres at 0.3 g/t AuEq (0.2 g/t gold, 1.3 g/t silver, 0.1% zinc) from 331.0m including and 1.0 metre at 4.7 g/t AuEq (4.0 g/t gold, 11.2 g/t silver, 1.1% lead, 0.6% zinc) from 404.0m.

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 1,044.9m shares 10m options 120m perf shares 16m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 Directors Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman Mr Sergio Rotondo, Exec. Director

THE MAGNATA FAULT

The Magnata and Sanchez Faults are two east-west striking sub-vertical faults. The faults can be seen in outcrop and magnetic data extending for tens of kilometres to the east and west of Hualilan. The Magnata Fault is located at Cerro Sur approximately 1.5 kilometres south of the Sanchez Fault and separates into the M1 and M2 Magnata Faults, both of which host high-grade shoots.

The Magnata and Sanchez Faults were historically recognised as hosting mineralisation at Hualilan. The mineralising fluids are interpreted to have migrated from a source below or along strike, within the faults forming steeply dipping zones of mineralisation in the Magnata and Sanchez Faults. These fluids migrating up the faults also formed nearby replacement Manto-style high grade lenses, oriented parallel to the limestone beds, dipping to the west.

GNDD-642 - Magnata Fault

GNDD-642 was an infill hole between the 80 metre spaced GNDD-399 (14.0m at 0.4 g/t AuEq) and GNDD-157 (12.0 metres at 20.9 g/t AuEq) on the Magnata fault. The hole intersected several zones of mineralisation including **18.8 metres at 6.3 g/t AuEq (4.5 g/t gold, 22.3 g/t silver, 3.3 % zinc, 0.1 % lead)** from 344.4m, including **7.4 metres at 10.8 g/t AuEq (7.4 g/t gold, 36.8 g/t silver, 6.3 % zinc, 0.1 % lead)** and **3.4 metres at 11.5 g/t AuEq (8.9 g/t gold, 42.5 g/t silver, 4.5 % zinc, 0.1 % lead)**. This extended the high grade mineralisation intersected in GNDD-157 40 metres up-dip. Additionally the hole intersected **64.0 metres at 0.5 g/t AuEq (0.4 g/t gold, 0.8 g/t silver, 0.1 % zinc)** from 18.0m hosted in intrusives. This upper intersection confirms the current MRE block model in this location.

As can be seen in Figure 8 over the page, the Magnata Fault mineralisation remains open at depth with GNDD-685 (assays pending) collared to test 40 metres below GNDD-157. GNDD-685 is logged as intersecting several zones of massive and semi massive sulphides and skarn alteration from 544 to 589 metres and 625 to 651 metres downhole. This (subject to assays) indicates that the Magnata Fault and associated mineralisation has swung to a steep northerly plunge in this location and remains strong and open at depth. A deeper follow up hole is planned to test an additional 40 metres below GNDD-685.

GNDD-586

GNDD-586 was drilled as a down-dip test below GNDD-348 (53.0 metres at 0.5 g/t AuEq) on the western limit of known mineralisation on the Magnata Fault. GNDD-586 intersected **57.7 metres at 0.4 g/t AuEq (0.3 g/t gold, 2.6 g/t silver, 0.2 % zinc)** including **8.0 metres at 1.8 g.t AuEq (1.3 g/t gold, 10.0 g/t silver, 0.9 % zinc)**.

Mineralisation remains open at depth, to the west along strike, and within the intrusives near the fault zone with additional drilling planned down-dip. The broad halo of lower grade mineralisation is similar to the near surface mineralisation intersected 80 metres east in drill holes GNDD-313 (24.0 metres at 0.7 g/t AuEq and 14.8 metres at 0.9 g/t AuEq) and GNDD-351 (4 metres at 0.5 g/t AuEq and 4.0 metres at 0.6 g/t AuEq) before deeper hole GNDD-491 intersected 16.8 metres at 11.7 g/t AuEq at depth.

GNDD-595

GNDD-595 was drilled as a downdip test below GNDD-540 (52.5 metres at 0.5 g/t AuEq and 30.0 metres at 0.6 g/t AuEq and 2.5 metres at 8.1 g/t AuEq) 40 metres east of GNDD-586. The hole intersected a similar broad zone of lower grade mineralisation to GNDD-540 with intersections including **13.8 metres at 0.4 g/t AuEq (0.3 g/t gold, 2.5 g/t silver)** from 198.4m and **21.2 metres at 0.7 g/t AuEq (0.6 g/t gold, 4.0 g/t silver, 0.1 % lead, 0.1% zinc)** from 226.0m, and **39.8 metres at 0.5 g/t AuEq (0.3 g/t gold, 2.9 g/t silver, 0.1 % lead, 0.3% zinc)** from 266.0m including **1.4 metres at 5.7 g/t AuEq (1.2 g/t gold, 28.5 g/t silver, 2.1 % lead, 8.0 % zinc)**.

The hole also intersected a fourth zone of deeper mineralisation intersecting **6.9 metres at 0.5 g/t AuEq (0.3 g/t gold, 3.8 g/t silver, 0.1 % lead, 0.3% zinc)** from 381.4m including **0.8 meters at 3.8 g/t AuEq (2.3 g/t gold, 30.8 g/t silver, 0.2 % lead, 2.3 % zinc) AuEq**. GNDD-615 (assays pending) has been collared to test another 40 metres down dip from GNDD-595 with deeper drilling contingent on the results on GNDD-615.

¹ Gold Equivalent (AuEq) values - Requirements under the JORC Code

• Assumed commodity prices for the calculation of AuEq is Au US\$1900 Oz, Ag US\$24 Oz, Zn US\$4,000/t, Pb US\$2000/t

- Metallurgical recoveries are estimated to be Au (95%), Ag (91%), Zn (67%) Pb (58%) across all ore types (see JORC Table 1 Section 3 Metallurgical assumptions) based on metallurgical test work.
- The formula used: AuEq (g/t) = Au (g/t) + [Ag (g/t) x 0.012106] + [Zn (%) x 0.46204] + [Pb (%) x 0.19961]
- CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

About Challenger Exploration

Challenger Exploration Limited's (ASX: CEL) aspiration is to become a globally significant gold producer. The Company is developing two complementary gold/copper projects in South America with a maiden **2.1 million ounce gold Resource Estimate** recently announced for the Hualilan Gold Project in San Juan, Argentina. Three rigs are currently drilling at Hualilan with 2-rigs operating at the Company's El Guayabo project in Ecuador.

The Company strategy is for the 100% owned Hualilan Gold Project to provide a high-grade low capex operation in the near term while it prepares for much larger bulk gold operations at both Hualilan and El Guaybo in Ecuador.

- 1. Hualilan Gold Project, located in San Juan Province Argentina, is a near term development opportunity. It has extensive drilling with over 150 historical and 700 CEL drill-holes and the Company has released an Interim JORC 2012 Compliant resource of 2,133,065 ounces which remains open in most directions. This resource contains a Skarn component 6.3 Mt at 5.6 g/t AuEq for 1.1 Moz AuEq and an intrusion/sediment-hosted component of 41.5Mt at 0.8 g/t AuEq for 1.0 Moz AuEq. The resource was based on 126,000 metres of CEL's 264,000 metre drill program. The project was locked up in a dispute for the 15 years prior to the Company's involvement and as a consequence had seen no modern exploration until CEL acquired the project in 2019. In the past 2 years CEL has completed over 700 drill holes for more than 200,000 metres of drilling. Results have included 6.1m @ 34.6 g/t Au, 21.9 g/t Ag, 2.9% Zn, 67.7m @ 7.3 g/t Au, 5.7 g/t Ag, 0.6% Zn, and 63.3m @ 8.5 g/t Au, 7.6 g/t Ag, 2.8% Zn. This drilling intersected high-grade gold over 3.5 kilometres of strike and extended the known mineralisation along strike and at depth in multiple locations. Recent drilling has demonstrated this high-grade skarn mineralisation is underlain by a significant intrusion-hosted gold system with intercepts including 209.0m at 1.0 g/t Au, 1.4 g/t Ag, 0.1% Zn and 110.5m at 2.5 g/t Au, 7.4 g/t Au, 0.90% Zn in intrusives. CEL's current program which is fully funded will include an additional 60,000 metres of drilling, an updated JORC Compliant Mineral Resource Estimate, and Scoping Study.
- 2. El Guayabo Gold/Copper Project covers 35 sq kms in southern Ecuador and is located 5 kilometres along strike from the 22-million ounce Cangrejos Gold Project¹. Prior to CEL the project was last drilled by Newmont Mining in 1995 and 1997 targeting gold in hydrothermal breccias. Historical drilling demonstrated potential to host significant gold and associated copper and silver mineralisation. Historical drilling has returned a number of intersections including 156m @ 2.6 g/t Au, 9.7 g/t Ag, 0.2% Cu and 112m @ 0.6 % Cu, 0.7 g/t Au, 14.7 g/t Ag which have never been followed up. CEL's maiden drilling program confirmed the discovery of a major Au-Cu-Ag-Mo gold system spanning several zones of significant scale. results from CEL's maiden drill program included 257.8m at 1.4 g/t AuEq including 53.7m at 5.3 g/t AuEq and 309.8m at 0.7 g/t AuEq including 397.1m at 0.6 g/t AuEq, and 528.7m at 0.5 g/t AuEq from surface to the end of the hole including 397.1m at 0.6 g/t AuEq from surface. The Company has drilled five of fifteen regionally significant Au-soil anomalies with over 500 metres of mineralisation intersected at all anomalies, confirming the potential for a major bulk gold system at El Guayabo. The Company has two rigs on site completing an additional 25,000 metres of diamond core drilling designed to allow the reporting of a maiden JORC 2012 Compliant resource for the main GY-A discovery zone.

COMPETENT PERSON STATEMENT – EXPLORATION RESULTS AND MINERAL RESOURCES

The information that relates to sampling techniques and data, exploration results, geological interpretation and Mineral Resource Estimate has been compiled Dr Stuart Munroe, BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results and Mineral Resources. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

The Mineral Resource Estimate for the Hualilan Gold Project was first announced to the ASX on 1 June 2022. The Company confirms it is not aware of any information or assumptions that materially impacts the information included in that announcement and that the material assumptions and technical parameters underpinning the Mineral Resource Estimate continue to apply and have not materially changed.

Criteria JORC Code explanation

Commentary

For drill holes from GNDD011 plus unsampled intervals from the 2019 drilling, 16 different multi-element Certified Standard Reference pulp samples (CRM) with known values for Au Ag Fe S Pb Cu and Zn. 7 different CRM's with known values for Au only have been submitted with samples of drill core, RC chips and channel samples to test the precision and accuracy of the analytic procedures of the MSA,ALS and SGS laboratories used. In the results received to date there has been no systematic bias is observed. The standards demonstrate suitable precision and accuracy of the analytic process. A summary of the standard deviations from the expected values for CRM's used is summarised below. Generally, an average of standard deviations close to zero indicates a high degree of accuracy and a low range of standard deviations with a low fail count indicates a high degree of precision.

Commentary

Replicate assay of 192 coarse reject samples from 2021 drilling has been done to verify assay precision. Original core samples were from the 2021 DD drilling which were analysed by SGS Laboratories (San Juan preparation and Lima analysis). Coarse reject samples were prepared and analysed by ALS (Mendoza preparation and Lima analysis). The repeat analysis technique was identical to the original. Except for Mo (molybdenum), the repeat analyses correlate closely with the original analyses providing confidence in precision of results between SGS and ALS. A summary of the results for the 192 sample pairs for key elements is provided below:

		Mean		Medi	an	Std Devia	ation	
								Correlation
Element	count	SGS	ALS	SGS	ALS	SGS	ALS	coefficient
Au (FA and GFA ppm)	192	1.754	1.680	0.432	0.441	20.8	21.5	0.9837
Ag (ICP and ICF ppm)	192	12.14	11.57	0.93	1.03	7085	5925	0.9995
Zn (ICP and ICF ppm)	192	6829	7052	709	685	4.54E+08	5.34E+08	0.9942
Cu (ICP and ICF ppm)	192	203.4	202.9	25.7	24.5	3.30E+05	3.35E+05	0.9967
Pb (ICP and ICF ppm)	192	1768	1719	94.7	91.6	5.04E+07	4.39E+07	0.9959
S (ICP and ICF %)	192	2.23	2.10	0.94	0.87	16.51	15.56	0.9953
Cd (ICP ppm)	192	43.9	42.4	4.1	4.0	19594	18511	0.9956
As (ICP ppm))	192	45.4	45.2	16.0	16.9	10823	9893	0.9947
Fe (ICP %)	189	3.07	3.30	2.38	2.31	4.80	9.28	0.9781
REE (ICP ppm)	192	63.5	72.8	39.4	44.3	3414	4647	0.9096
Mo (ICP and ICF ppm)	192	7.69	1.68	6.74	0.97	85.83	10.33	0.3026

Values below detection were set to half the detection limit

Limit of detection for Fe was exceeded for 3 samples submitted to SGS with no overlimit analysis

REE is the sum off Ce, La, Sc, Y. Values below detection were set at zero

CEL have sought to twin and triplicate some of the historic and recent drill holes to check the results of previous exploration. A preliminary analysis of the twin holes indicates similar widths and grades for key elements assayed. The twin holes are: GNDD003 – DDH34 and 04HD08 GNRC110 – DDH53 GNDD144 – GNDD021 – 05HD39 GNRC107 – GNDD008/008A GNDD206 – DDH54

Criteria	JORC Code explanation	Commentary
		GNDD421 – GNDD424
Location of data points	 Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys) trenches mine 	Following completion of drilling, collars are marked and surveyed using a differential GPS (DGPS) relative to a nearby Argentinian SGM survey point. The collars have been surveyed in POSGAR 2007 zone 2 and converted to WGS84 UTM zone 19s.
	workings and other locations used in Mineral Resource estimation. - Specification of the grid system	Following completion of the channel sampling, the location of the channel samples is surveyed from a survey mark at the entrance to the underground workings, located using differential GPS. The locations have been surveyed in POSGAR 2007 zone 2 and converted to WGS84 UTM zone 19s.
	used. Quality and adequacy of 	The drill machine is set-up on the drill pad using hand-held survey equipment according to the proposed hole design.
	topographic control.	Diamond core drill holes up to GNDD390 are surveyed down-hole at 30-40m intervals down hole using a down-hole compass and inclinometer tool. RC drill holes and diamond core holes from GNDD391 were continuously surveyed down hole using a gyroscope to avoid magnetic influence from the drill string and rocks. The gyroscope down-hole survey data is recorded in the drill hole database at 10m intervals.
		Ten diamond drill holes have no down hole survey data due to drill hole collapse or blockage of the hole due to loss of drilling equipment. These are GNDD036, 197, 212, 283, 376, 423, 425, 439, 445 and 465. For these holes, a survey of the collar has been used with no assumed deviation to the end of the hole.
		All current and previous drill collar sites, Minas corner pegs and strategic surface points have been surveyed using DGPS to provide topographic control for the Project. In addition, AWD3D DTM model with a nominal 2.5 metre precision has been acquired for the project and greater surrounding areas. Drone-based topographic survey data with 0.1 meter precision is being acquired over the project to provide more detail where required.
Data spacing and distribution	 Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the 	No regular drill hole spacing has been applied across the Project, although nominal 80m x 80m, 40m x 80m and 40m x 40m drill spacing is being applied to the drilling to define mineralised areas, where appropriate. Drilling has been completed to check previous exploration, extend mineralisation along strike, and provide some information to establish controls on mineralization and exploration potential. 80m x 80m drilling is designed for broad exploration of intrusion-hosted targets, whereas 40 m x 40m drilling is used to define and area that is expected to form part of a Mineral Resource Estimate in sedimentary and intrusive-hosted targets.
	Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. - Whether sample compositing has been applied.	Samples have not been composited for reporting.

Criteria	JORC Code explanation	Commentary
Orientation of data in relation to geological structure	 Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias this should be assessed and reported if material. 	As far as is currently understood and where practicable, the orientation of sampling achieves unbiased sampling of structures and geology controlling the mineralisation. Some exploration holes have drilled at a low angle to mineralisation and have been followed up with drill holes in the opposite direction to define mineralised domains. For underground channel sampling, the orientation of the sample is determined by the orientation of the workings. Where the sampling is parallel with the strike of the mineralisation, plans showing the location of the sampling relative to the orientation of the mineralisation, weighted average grades and estimates of true thickness are provided to provide a balanced report of the mineralisation that has been sampled. Drilling has been designed to provide an unbiased sample of the geology and mineralisation targeted.
Sample security	 The measures taken to ensure sample security. 	Samples were under constant supervision by site security, senior technical personnel and courier contractors prior to delivery to the preparation laboratories in San Juan and Mendoza.
Audits or reviews	 The results of any audits or reviews of sampling techniques and data. 	There has not yet been any independent reviews of the sampling techniques and data.

Commentary

- down hole length and interception depth
- hole length. -
- If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report the Competent Person should clearly explain why this is the case.

Ag US\$24 /oz, Zn US\$ 4,000 /t and Pb US 2,000/t.

Average metallurgical recoveries for Au, Ag, Zn and Pb have been estimated from the results of Stage 1 metallurgical test work completed by SGS Metallurgical Operations in Lakefield, Ontario using a combination of gravity and flotation combined metallurgical samples as detailed in the Criteria below.

For the AuEg calculation average metallurgical recovery is estimated as 94.9% for gold, 90.9% for silver, 67.0% for Zn and 57.8% for Pb.

Accordingly, the formula used for Au Equivalent is: AuEq (g/t) = Au (g/t) + [Ag (g/t) x (24/1900) x (0.909/0.949)] +[Zn (%) x (40.00*31.1/1900) x (0.670/0.949)] + (Pb (%) x 20.00*31.1/1900) x (0.578/.9490}.

Criteria	JORC Code explanation	Commentary
Relationship between mineralisation widths and intercept lengths	 These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known its nature should be reported. If it is not known and only the down hole lengths are reported there should be a clear statement to this effect (eg 'down hole length true width not known'). 	The mineralisation is moderately or steeply dipping and strikes NNE and ENE. For some drill holes, there is insufficient information to confidently establish the true width of the mineralized intersections at this stage of the exploration program. Apparent widths may be thicker in the case where the dip of the mineralisation changes and/or bedding-parallel mineralisation intersects NW or ENE-striking cross faults and veins. Representative cross section interpretations have been provided periodically with releases of significant intersections to allow estimation of true widths from individual drill intercepts.
Diagrams	 Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	Representative maps and sections are provided in the body of reports released to the ASX.
Balanced reporting	 Where comprehensive reporting of all Exploration Results is not practicable representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	All available final data have been reported where possible and plans of all drilling with results.
Other substantive exploration data	 Other exploration data if meaningful and material should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density groundwater geotechnical and rock characteristics; potential deleterious or contaminating substances. 	Geological context and observations about the controls on mineralisation where these have been made are provided in the body of the report. Specific gravity measurements have been taken from the drill core recovered during the drilling program. These data are used to estimate densities in Resource Estimates. Eight Induced Polarisation (IP) lines have been completed in the northern areas of the Project. Stage 1 surveying was done on 1 kilometre length lines oriented 115° azimuth, spaced 100m apart with a 50m dipole. The initial results indicate possible extension of the mineralisation with depth. Stage 2 surveying was done across the entire field on $1 - 3$ kilometre length lines oriented 090°, spaced 400m apart with a 50m dipole. On-going data interpretation is being done as drilling proceeds. Two ground magnetic surveys and a drone magnetic survey have been completed. The results of these data and subsequent geological interpretations are being used to guide future exploration.

Criteria	JORC Code explanation	Commentary
Further work	 The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step- out drilling). Diagrams clearly highlighting the areas of possible extensions including the main geological interpretations and future drilling areas provided this information is not commercially sensitive. 	 CEL Plans to undertake the following over the next 12 months Additional resource extension, infill and exploration drilling; Detailed interpretation of known mineralized zones; Geophysical tests for undercover areas. Structural interpretation and alteration mapping using high resolution satellite data and geophysics to better target extensions of known mineralisation. Field mapping program targeting extensions of known mineralisation. Further metallurgical and comminution test work. A preliminary economic assessment / scoping study for a mining project.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	 Measures taken to ensure that data has not been corrupted by for example transcription or keying errors between its initial collection and its use for Mineral Resource estimation purposes. Data validation procedures used. 	Geological logging completed by previous explorers was done on paper copies and transcribed into a series of excel spreadsheets. These data have been checked for errors. Checks have been made against the original logs and with follow- up twin and close spaced drilling. Only some of the historic drill holes have been used in the Resource Estimate, including the results presented in Section2. Some drill holes have been excluded where the geology indicates that the drill hole is likely mis-located or where the drill hole has been superseded by CEL drilling. For CEL drilled holes, assay data is received in digital format. Backup copies are backed up into a cloud-based file storage system and the data is entered into a drill hole database which is also securely backed up off site. The drill hole data is backed up and is updated periodically by the CEL GIS and data management team.
Site visits	 Comment on any site visits undertaken by the Competent Person and the outcome of those visits. 	The Competent Person has undertaken site visits during exploration. Site visits were undertaken from 3 to 16 October 2019 15 to 30 November 2019 and 1-19 February 2020 before COVID-19 closed international travel. Post COVID site visits were undertaken from 21 November – 4 December 2021 and 11 – 23 May 2022. The performance of the drilling program,
	 If no site visits have been undertaken indicate why this is the case. 	collection of data, sampling procedures, sample submission and exploration program were initiated and reviewed during these visits.
Geological interpretation	 Confidence in (or conversely the uncertainty of) the geological interpretation of the mineral deposit. Nature of the data used and of any assumptions made. The effect if any of alternative interpretations on Mineral Resource estimation 	The geological interpretation is considered appropriate given the drill core density of data that has been collected, access to mineralisation at surface and underground exposures. Given the data, geological studies past and completed by CEL, the Competent Person has a high level of confidence in the geological model that has been used to constrain the mineralised domains. It is assumed that networks of fractures controlled by local geological factors have focussed hydrothermal fluids and been the site of mineralisation in both the prograde zinc skarn and retrograde mesothermal – epithermal stages of hydrothermal evolution. The interpretation captures the essential geometry of the mineralised structure and lithologies with drill data supporting the interpretation captures the essential geometry of the mineralised domains have been built using available.
	estimation. - The use of geology in guiding and controlling Mineral Resource estimation. - The factors affecting continuity both of grade and geology.	the findings from the initial underground sampling activities. Mineralised domains have been built using explicit wireframe techniques from 0.2 – 0.5 g/t AuEq mineralised intersections, joined between holes by the instruction from the geology and structure. Continuity of grade between drill holes is determined by the intensity of fracturing, the host rock contacts (particularly dacite – limestone contacts) and by bedding parallel faults, particularly within limestone, at the limestone and overlying sedimentary rock contact and within the lower sequences of the sedimentary rocks within 40m of the contact. No alternative interpretations have been made form which a Mineral Resource Estimate has been made.
Dimensions	- The extent and variability of the Mineral Resource expressed as length (along strike or otherwise) plan width and depth below surface to the upper and lower limits of the	30 separate domains were interpreted over a strike length of 2.2kms. The domains vary in width and orientation from 2m up to 100m in width. The deepest interpreted domain extends from the surface down approximately 550m below the surface.

		5.0m (N) x 2.5m (RL) to maintain the resolution of the mineralised domains. The 20m Y and vertical block dimensions were chosen to reflect drill hole spacing and to provide definition for potential mine planning. The shorter 10m X dimension we used to reflect the geometry and orientation of the majority of the domain wireframes. Variography was carried out using Leapfrog Edge software on the two metre composited data from each of the 28 domains for each variable.
		All relevant variables; Au, Ag, Zn, Fe and S in each domain were estimated using Ordinary Kriging using only data from within that domain. The orientation of the search ellipse and variogram model was controlled using surfaces designed to reflect the local orientation of the mineralized structures.
		An oriented "ellipsoid" search for each domain was used to select data for interpolation. A 3 pass estimation search was conducted, with expanding search ellipsoid dimensions and decreasing minimum number of samples with each successive pass. First passes were conducted with ellipsoid radii corresponding to 40% of the complete range of variogram structures for the variable being estimated. Pass 2 was conducted with 60% of the complet range of variogram structures for the variable being estimated. Pass 3 was conducted with dimensions corresponding to 200% of the semi-variogram model ranges. Blocks within the model where Au was not estimated during the first 3 passe were assigned as unclassified. Blocks for Ag, Zn, Fe and S that were not estimated were assigned the average values on a per-domain basis.

Criteria .	JORC Code explanation	Commentary
		Validation checks included statistical comparison between drill sample grades and Ordinary Kriging block estimate results for each domain. Visual validation of grade trends for each element along the drill sections was also completed in additio to swath plots comparing drill sample grades and model grades for northings, eastings and elevation. These checks show good correlation between estimated block grades and drill sample grades.
Moisture -	 Whether the tonnages are estimated on a dry basis or with natural moisture and the method of determination of the moisture content. 	Tonnage is estimated on a dry basis.
Cut-off -	 The basis of the adopted cut-off grade(s) or quality parameters applied. 	The following metals and metal prices have been used to report gold grade equivalent (AuEq): Au US\$ 1900 / oz Ag US\$2 /oz, Zn US\$ 4,000 /t and Pb US 2,000/t. Average metallurgical recoveries for Au, Ag, Zn and Pb have been estimated from the results of Stage 1 metallurgical test work completed by SGS Metallurgical Operations in Lakefield, Ontario using a combination of gravity and flotation combined metallurgical samples as detailed in the Criteria below. For the AuEq calculation average metallurgical recovery is estimated as 94.9% for gold, 90.9% for silver, 67.0% for Zn and 57.8% for Pb. Accordingly, the formula used for Au Equivalent is: AuEq (g/t) = Au (g/t) + [Ag (g/t) × (24/1900) × (0.909/0.949)] + [Zn (%) (40.00*31.1/1900) × (0.670/0.949)] + (Pb (%) × 20.00*31.1/1900) × (0.578/.9490). Based on the break-even grade for an optimised pit shell for gold equivalent, a AuEq cut-off grade of 0.25 ppm is used to report the resource within an optimised pit shell run at a gold price of US\$1,800 per ounce and allowing for Ag, Zn and Pl credits. Under this scenario, blocks with a grade above the 0.25 g/t Au Eq cut off are considered to have reasonable prospects of mining by open pit methods. A AuEq cut-off grade of 1.0 ppm was used to report the resource beneath the optimised pit shell run as these blocks are considered to have reasonable prospects of future mining by underground methods.
Mining factors	 Assumptions made regarding possible mining methods minimum mining dimensions and internal (or if applicable external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case this should 	 The Resource estimate has assumed that near surface mineralisation would be amenable to open pit mining given that t mineralisation is exposed at surface and under relatively thin unconsolidated cover. A surface mine optimiser has been used to determine the proportion of the Resource estimate model that would be amenable to eventual economic extraction by open pit mining methods. The surface mine optimiser was bult using the following parameters with prices USD: Au price of \$1,800 per oz, Ag price of \$23.4 per oz, Zn price of \$3,825 per tonne and Pb price of \$1,980 per ton Average metallurgical recoveries of 94.9% for Au, 90.9% for Ag and 67% for Zn and 57.8% for Pb. Ore and waste mining cost of \$2.00 per tonne Unconsolidated cover removal cost of \$0.10 per tonne Processing cost of \$10.00 per tonne Transport and marketing of \$50 / oz of AuEq (road to Jan Juan then rail to Rosario Port) Royalty of \$60 per oz Au, 3% for Ag, Zn and Pb.

Criteria	JORC Code explanation	Commentary
	be reported with an explanation of the basis of the mining assumptions made.	 Assumed concentrate payability of 94.1% for Au, 82.9% for Ag, 90% for Zn and 95% for Pb. 45° pit slopes on the western side of the pit and 55° on the eastern side of the pit Blocks above a 0.25 g/t AuEq within the optimised open pit shell are determined to have reasonable prospects of future economic extraction by open pit mining and are included in the Resource estimate on that basis. Blocks below the open pit shell that are above 1.0 g/t AuEq are determined to have reasonable prospects of future economic extraction by underground mining methods and are included in the Resource estimate on that basis.
Metallurgical factors or assumptions	 The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the metallurgical assumptions made. 	 CEL has completed Stage 1 metallurgical test work on representative composite sample of mineralisation from: Two separate composite samples of limestone-hosted massive sulphide (manto) Sample A has a weighted average grade of 10.4 g/t Au, 31.7 g/t Ag, 3.2 % Zn and 0.46 % Pb. Sample B has a weighted average grade of 9.7 g/t Au, 41.6 g/t Ag, 4.0% Zn and 0.48 % Pb. One dacite (intrusive) composite sample with a weighted average grade of 1.1 g/t Au, 8.1 g/t Ag and 0.10 % Zn and 0.04% Pb. One sadiment hosted (fine grained sandstone and siltstone) composite sample with a weighted average grade of 0.68 g/t Au, 7.5 g/t Ag, 0.34 % Zn and 0.06 % Pb. One oxidised limestone (manto oxide) composite sample with a weighted average grade of 7.0 g/t Au, 45 g/t Ag, 3.7% Zn and 0.77% Pb. Gravity recovery and sequential flotation tests of the higher-grade limestone hosted mineralisation involved; primary P80 = 51 micron primary grind, gravity recovery, Pb-Cu followed by Zn rougher flotation, p80 = 29 micron regrind of the Zn rougher concentrate, four re-cleaning Stages of the Pb/Cu rougher concentrate, four re-cleaning Stages on the Zn rougher concentrate, and additional gravity recovery stages added to the Zn Rougher concentrate This results in the following products that are likely to be saleable Au-Ag concentrate (118 g/t Au, 765 g/t Ag) with low deleterious elements, Pb concentrate (55% Pb, 178 g/t Ag) 76 g/t Ag) with low deleterious elements, relatively high Cd, but at a level that i unlikely to attract penalties. tailing grades of 2 to 3 g/t Au which respond to intensive cyanide leach with recoveries of 70-80% of any residual gold and silver to a gold doré bar.
		 primary P80 = 120-80 micron primary grind, gravity recovery,

Issued Capital 1,044.9m shares 10m options 120m perf shares 16m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 Directors Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman Mr Sergio Rotondo, Exec. Director

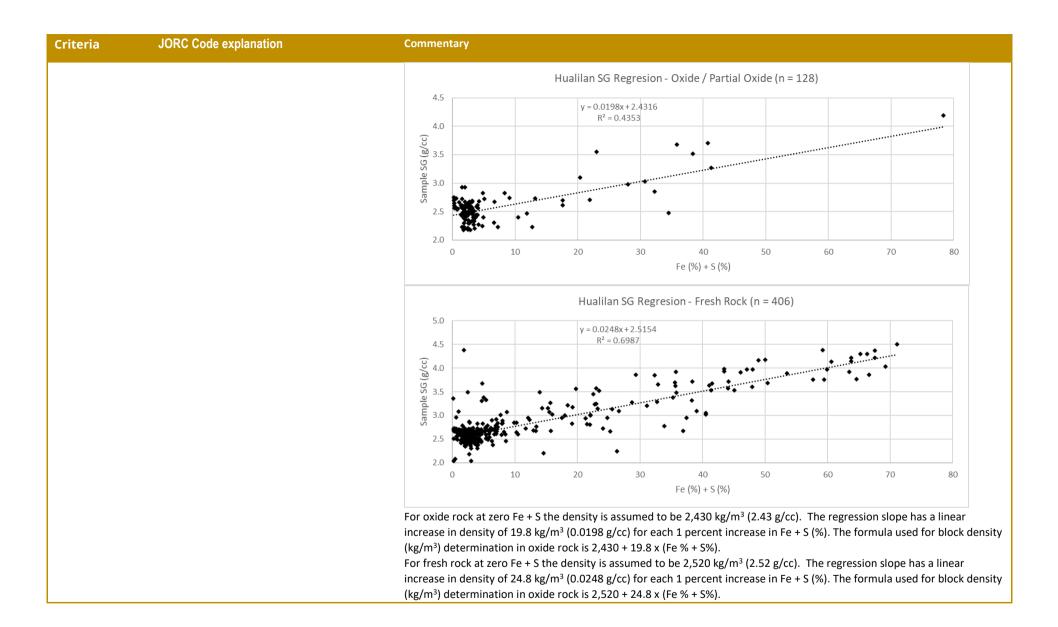

Criteria	JORC Code explanation	Commentary
		 3. single stage rougher sulphide flotation, 4. P80 = 20-30 micron regrind of the rougher concentrate (5-10% mass), 5. one or two re-cleaning stages of the Au-Ag Rougher concentrate At primary grind of p80 = 76 micron and regrind of p80 = 51 micron an AuAg concentrate can be produced grading states of 97% (Au) and 85% (Ag).
		One test of a sediment hosted composite sample (5-10% of the mineralisation at the Project) was a repeat of the testing done on the intrusive-hosted mineralisation. This produced an Au-Ag concentrate grading 23.6 g/t Au and 2 g/t Ag at total recoveries of 85% (Au) and 87% (Ag). Further test work is likely to be done as part of more detailed studies. It is likely that the concentrate produced from the sediment-hosted mineralisation will be combined with the Au-Ag concentrate from the limestone and intrusive-hosted mineralisation.
		Applying recoveries of 70% for both gold and silver to the various concentrate tailings components where leaching is likely to be undertaken during production generates recoveries of: • 95% (Au), 93% (Ag), 89% (Zn), 70% (Pb) from the high-grade skarn (manto) component of the mineralisation; • 96% (Au) and 88% (Ag) from the intrusion-hosted component of the mineralisation; • 85% (Au) and 87% (Ag) from the sediment-hosted component of the mineralisation;
		An intensive cyanide leach test of oxide (limestone and dacite hosted mineralisation has produced recoveries of 78 (Au) and 64% (Ag) which is expected to be recovered into gold doré bar. While the oxide component of the mineralisation comprises only a small percentage of the Hualilan mineralisation its lies in the top 30-40 metres and would be mined early in the case of an open pit operation.
		Based on the test work to date and the proportions of the various mineralisation types in the current geological model, it is expected that overall average recoveries for potentially saleable metals will be: - 94.9% Au, - 90.9% for Ag - 67.0% for Zn and - 57.8% for Pb
		Additional Stage 2 work involving comminution and variability testing, blended test work, and pilot plant testing is ongoing and planned.
Environmental factors or assumptions	 Assumptions made regard waste and process residue It is always necessary as p of determining reasonable 	It is considered that there are no significant environmental factors which would prevent the eventual extraction of gold <i>lisposal options.</i> from the project. Criteria	JORC Code explanation	Commentary
Bulk density	 eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts particularly for a greenfields project may not always be well advanced the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. Whether assumed or determined. If assumed the basis for the assumptions. If determined the method used whether wet or dry the frequency of the measurements the nature size and representativeness of the samples. The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs porosity etc) moisture and differences between rock and alteration zones within the deposit. Discuss assumptions for bulk density estimates used in the evaluation process of the different materials. 	CEL has collected specific gravity measurements from drill core, which have been used to estimate block densities for the Resource estimate. Within the mineralised domains there are 534 specific gravity measurements made on drill core samples of $0.1 - 0.2$ metres length. Measurements we determined on a dry basis by measuring the difference in sample weight in water and weight in air. For porous samples, the weight in water was measured after wrapping the sample so that no water enters the void space during weighing. A regression model for block density determination in oxide / partial oxide / fracture oxide (oxide) rock and a separate regression model for fresh rock samples has been made by plotting assay interval Fe (%) + S (%) from the interval where the SG measurement was made against the SG measurement was flat is commonly associated with gold and base metal mineralisation at Hualilan. SG plotted against (Fe+S) follows a linear trend within the mineralised domains for oxide and fresh rock as shown in the graphs below.

Criteria	JORC Code explanation	Commentary			
Classification Audits or reviews	 The basis for the classification of the Mineral Resources into varying confidence categories. Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations reliability of input data confidence in continuity of geology and metal values quality quantity and distribution of the data). Whether the result appropriately reflects the Competent Person's view of the deposit. The results of any audits or reviews of Mineral Resource estimates. 	The Mineral Resource has been classified based on the guidelines specified in the JORC Code. The classification level is based upon semi-qualitative assessment of the geological understanding of the deposit, geological and mineralisation continuity, drill hole spacing, QC results, search and interpolation parameters and an analysis of available density information. The estimation search strategy was undertaken in three separate passes with different search distances, and the minimum number of samples used to estimate a block which were then used as a guide for the classification of the resource into Indicated, Inferred and Unclassified. The classification was then further modified to restrict the Indicated Resource to the domains with closer spaced drilling. The potential open pit resource was constrained within an optimised pit shell run using a gold price of \$1,800 per ounce. Resources reported inside the pit shell were reported above a AuEq cut-off grade of 0.25 ppm and Resources outside the pit shell were reported above a AuEq cut-off grade of 1.0 ppm. Resource reported outside the pit shell above a 1.0 g/t AuEq cut-off is considered 100% Inferred. The Competent Person has reviewed the result and determined that these classifications are appropriate given the confidence in the data and results from drilling.			
reviews Discussion of relative accuracy/ confidence	 Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits or if such an approach is not deemed appropriate a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate. The statement should specify whether it relates to global or local estimates and if local state the relevant to technical and economic evaluation. Documentation should include assumptions made and the 	 There is sufficient confidence in the data quality drilling methods and analytical results that they can be relied upon. The available geology and assay data correlate well. The approach and procedure is deemed appropriate given the confidence limits. The main factors which could affect relative accuracy are: domain boundary assumptions orientation grade continuity top cut. Grade continuity is variable in nature in this style of deposit and has not been demonstrated to date and closer spaced drilling is required to improve the understanding of the grade continuity in both strike and dip directions. It is noted that the results from the twinning of three holes by La Mancha are encouraging in terms of grade repeatability. The deposit contains very high grades and there is need for the use of top cuts. No production data is available for comparison.
