

## ASX ANNOUNCEMENT

7 November 2022

### Yinnetharra REE/Li Project Update

#### HIGHLIGHTS

- ❖ Yinnetharra rock chip results continue to have highly anomalous values in REE (up to 924ppm TREO)
- ❖ Soil geochemical results indicate targets for field checking near outcrops not previously sampled
- ❖ A high resolution magnetic and radiometric (50m spacing) survey is to start shortly. This will form the basis for the next field trip later this month
- ❖ White Cliff plans to aggressively advance its lithium and rare earth element project portfolio

White Cliff Minerals Limited (**White Cliff** or the **Company**) is pleased to provide an update on the Yinnetharra REE/Li project (**Figure 1**), and the progress on numerous work programs.

Commenting on the work programs, White Cliff Technical Director Ed Mead said:

"Our knowledge of Yinnetharra continues to grow and with the imminent start of a high resolution magnetic and radiometric survey at 50 metre spaced lines, we will have a superior layer of data to work off, compared to the 400m regional data we have been using while waiting for mustering to end. The geochemical and rock chip data we have gleaned from the Yinnetharra project over the last few months will assist with the interpretation and refined target generation phase. The speed of assay return has continued to be challenging, and this has slowed our reporting to shareholders.

"I look forward to getting back on the ground at Yinnetharra in the next few weeks and hope to further unlock the area as we narrow down the primary source of mineralisation.

"We are also progressing Hines Hill with a program of works (**PoW**) due shortly, with further geochemical sampling at Hines Hill and a maiden program at North Kellerberrin underway. We are assessing Lake Tay with acquisition of available GIS and geophysical data, and will also be undertaking a geochemical program at Diemals."

**Figure 1:** Li/REE Project location map in Western Australia

### Yinnetharra - REE/Li Project

The Yinnetharra REE/Li project consists of six tenements (**Figure 1 and 2**), within the Gascoyne lithium region, located about 100km northeast of Gascoyne Junction and 85km south of Hastings Rare Earths (ASX:HAS) world-class Yangibana rare earths project. The 6 tenements that make up the Yinnetharra Project are Yinnetharra (E09/2628), Minga Well (E09/2641), Wabli Creek (E09/2629), Injinu Hills (E09/2609), Weedarra (E09/2608) and Sandy Creek (E09/2630).

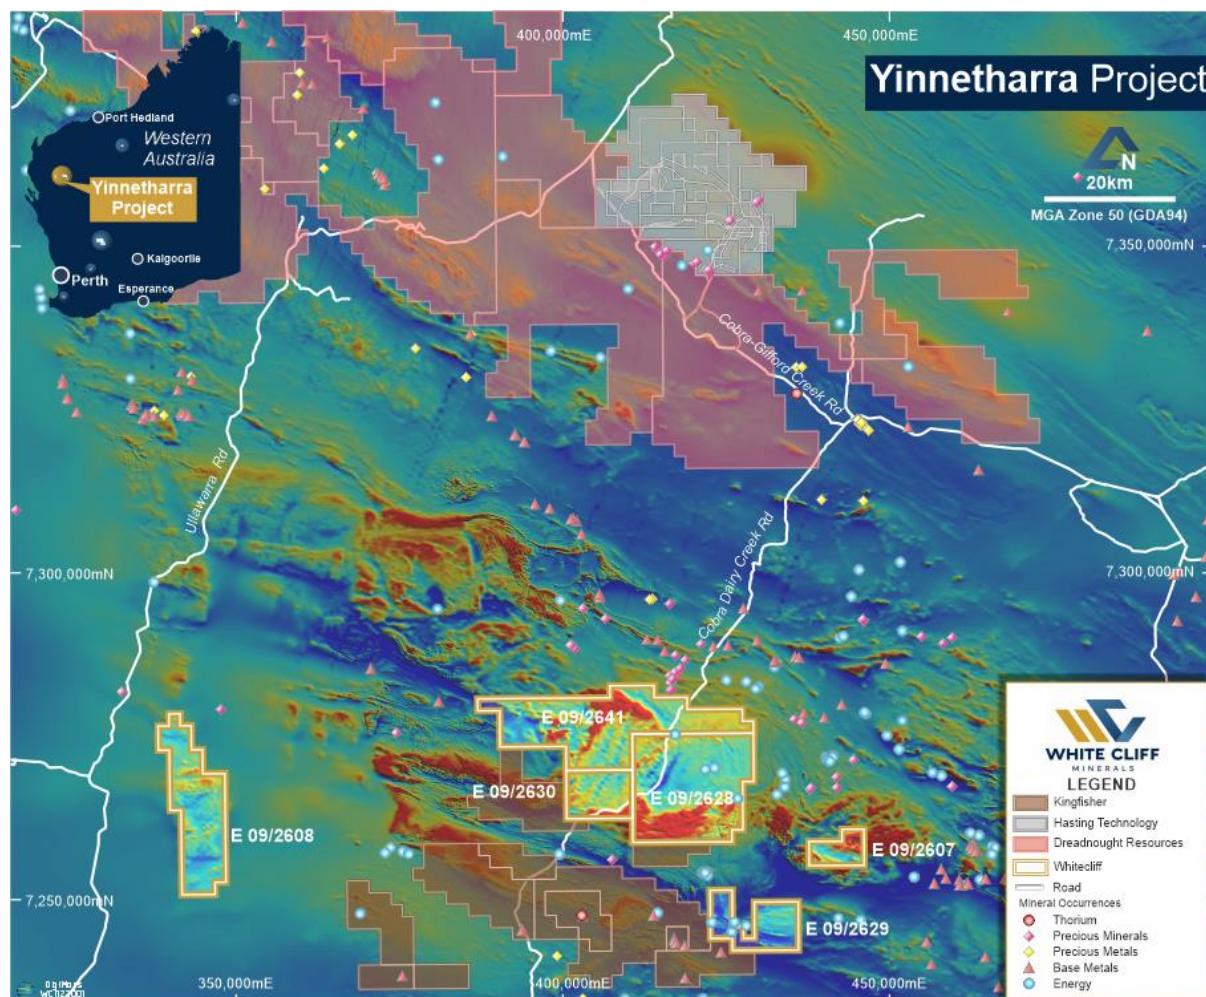

Lithium and REE's are being targeted within the project area, with recent results returning positive results for REE's.

Over the past few months while mustering has been undertaken over the Yinnetharra Station we have completed rock chip and geochemical soil sampling

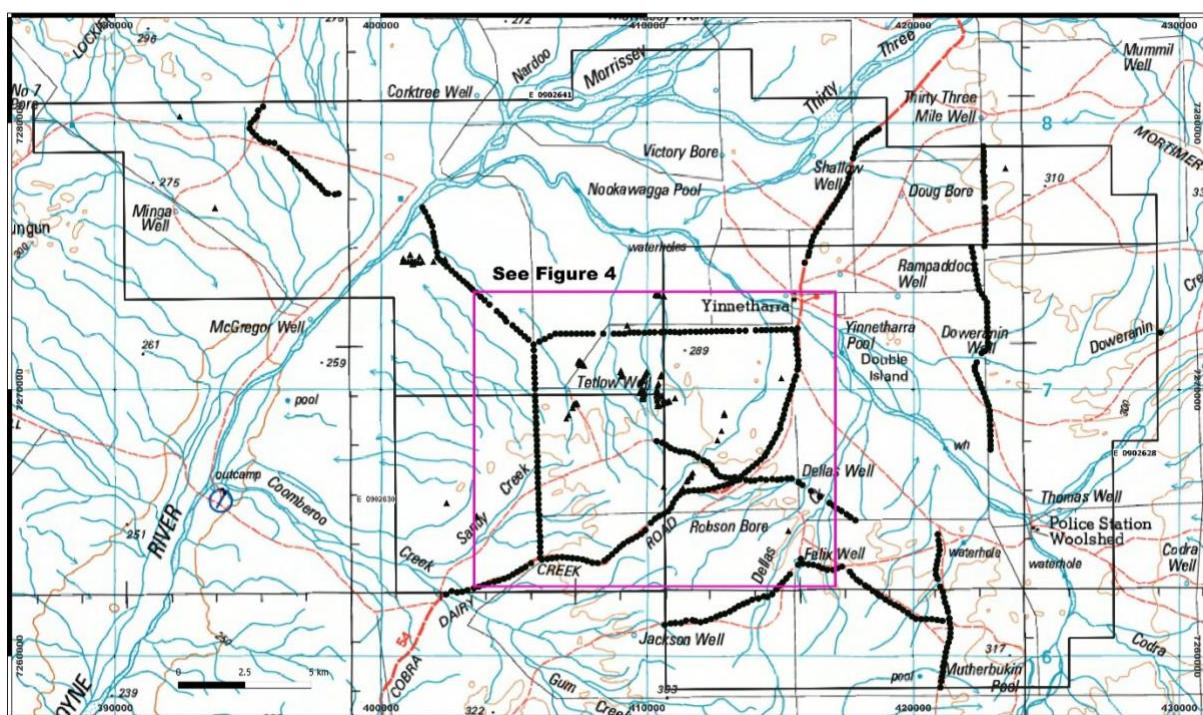

programs. We have expedited some samples that looked encouraging, with returned assays up to 924ppm TREO for rock chips and a high background in soils of ~150ppm TREO (**Table 1**).

In consultation with Southern Geoscience Consultants (SGC), the importance of having high resolution data has been confirmed as critical to locating outcropping mineralisation. The current dataset is regional 400m spaced, and with 574km<sup>2</sup> of tenements we recognise we have reached the limit of this dataset. A high resolution magnetic and radiometric survey at 50m spacing covering the entire project area is to start shortly and will form the basis of upcoming field trips.

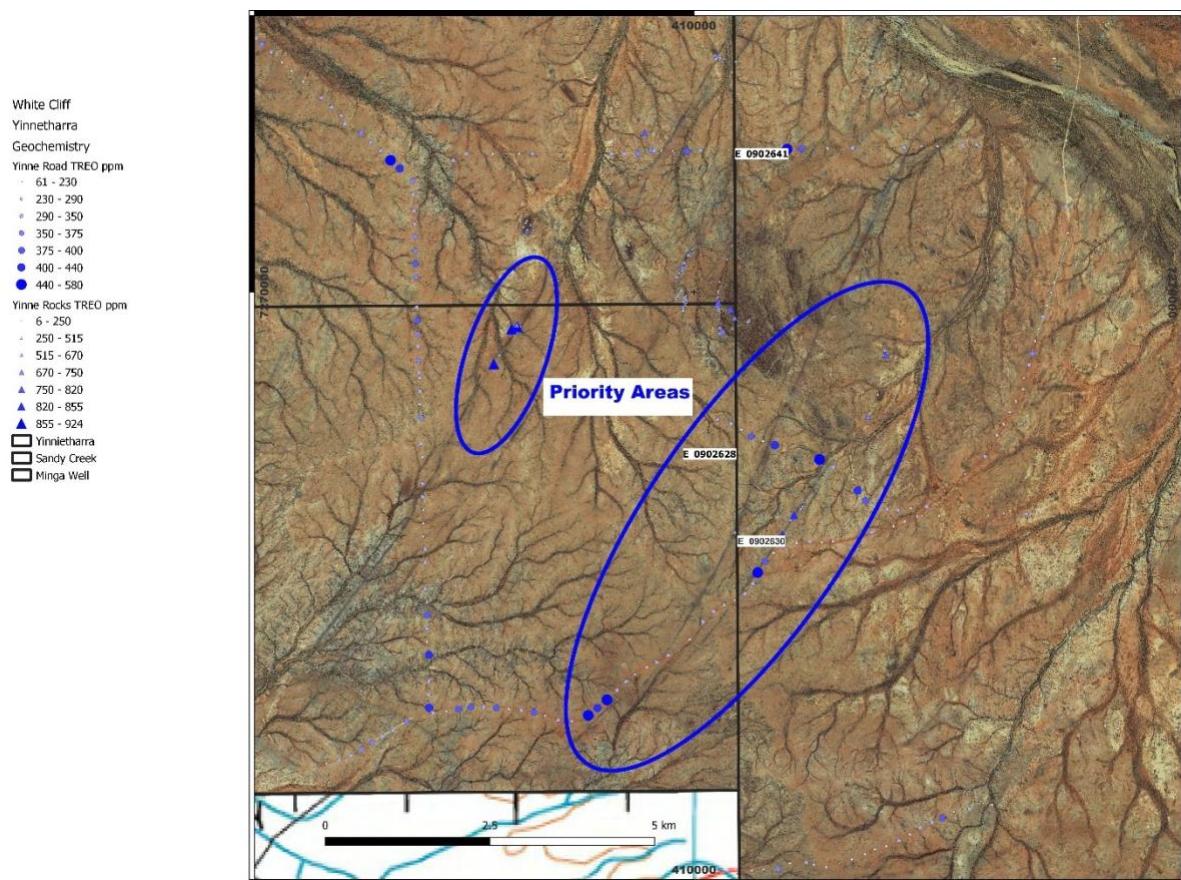

The benefit of the work to date, is that the rock chip assays can be used to calibrate the radiometric data and will further assist targeting. Another aim of the survey is to target pegmatites in the northern part of Yinnetharra, for lithium, where explorers to the north of us are having success.

**Figure 2:** Yinnetharra (WCN 100%) REE/Li project. Kingfisher Mining to the south and contiguous to Wabli Creek E29/2629, with Dreadnought Resources Limited and Hasting Technology Metals Limited to the north.

**Figure 3:** Yinnetharra (WCN 100%) REE/Li project, showing areas of rock chip sampling and soil traverses.

**Figure 4:** Yinnetharra (WCN 100%) REE/Li project, showing priority areas for follow-up exploration.

**Table 1:** Results of Rare Earth Element (REE) rock chip sample analyses TREO as ppm

**Competent Persons Statement**

The Information in this report that relates to exploration results, mineral resources or ore reserves is based on information compiled by Mr Allan Younger, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Younger is an employee of the company. Mr Younger has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity that he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the 'Australian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves' (the JORC Code). Mr Younger consents to the inclusion of this information in the form and context in which it appears in this report.

## APPENDIX 1.

The following Tables are provided to ensure compliance with the JORC Code (2012 Edition) requirements for the reporting of Exploration Results at Yinnetharra and Diemals.

### Section 1: Sampling Techniques and Data

(Criteria in this section applies to all succeeding sections)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i>	Rochchip samples of lithological material and soil samples from horizon B, were taken from Yinnetharra.
	<i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i>	Rockchip from outcrops. Reconnaissance soil sampling
	<i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i>	Rock chip sampling across the lithologies, in a channel fashion, to obtain representative material was completed, with sample size of 1-4 kg. Soils sieved -2mm, nominal weight 300gm from 15-20cm depths.
<b>Drilling techniques</b>	<i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is orientated and if so, by what method, etc).</i>	No drilling is being reported.
<b>Drill sample recovery</b>	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i>	No drilling is being reported.
	<i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i>	No drilling is being reported.
	<i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	No drilling is being reported.
<b>Logging</b>	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i>	Sample type and landform/regolith settings were recorded, and geo-tagged photos of samples and settings taken. No drilling reported.
	<i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i>	Geochemical sample from regolith, rockchip from outcrop.

Criteria	JORC Code explanation	Commentary
	<i>The total length and percentage of the relevant intersections logged.</i>	
<b>Sub-sampling techniques and sample preparation</b>	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	No sub-sampling has been undertaken.
	<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i>	
	<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	No sub-sampling has been undertaken.
	<i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i>	No sub-sampling has been undertaken.
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	For Rockchip, the sample size of 1-4 kilograms is appropriate and representative of the grain size and mineralisation style of the deposit.  For geochemical sample, the sample size of 0.3 kilograms is appropriate and representative of the grain size and mineralisation style of the deposit.
<b>Quality of assay data and laboratory tests</b>	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i>	Rock chip samples have been submitted to ALS Laboratories for analysis by 4 Acid digest with ME-MS81L-REE for a comprehensive suite of pegmatitic and related elements.  Elements were: Ba, Ce, Cr, Cs, Dy, Er, Eu, Ga, Gd, Hf, Ho, La, Lu, Nb, Nd, Pr, Rb, Sc, Sm, Sn, Sr, Ta, Tb, Th, Ti, Tm, U, V, W, Y, Zr.  Soil samples were submitted to ALS Laboratories for analysis by Aqua Regia digest using method ME-MS41L™.  Elements were: Ag, Al, As, Ba, Ca, Cd, Ce, Co, Cr, Cs, Cu, Dy, Er, Eu, Fe, Ga, Ge, Hf, Ho, In, K, La, Li, Lu, Mg, Mn, Mo, Na, Nb, Nd, Ni, P, Pb, Pr, Rb, Re, S, Sb, Sc, Se, Sm, Sn, Sr, Ta, Tb, Te, Th, Ti, Tl, Tm, U, V, W, Y, Yb, Zn, Zr.  Au by Au-TL44.
	<i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i>	REE analysed using MS41L-REE™, elements were: Dy, Er, Eu, Gd, Ho, Lu, Nd, Pr, Sm, Tb, Tm & Yb.  CRM & field duplicated samples were inserted every 25 samples for QA/QC control
	<i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i>	
<b>Verification of sampling and assaying</b>	<i>The verification of significant intersections by either independent or alternative company personnel.</i>	Assay results are reviewed by 2 company personnel.
	<i>The use of twinned holes.</i>	No drilling being reported
	<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i>	All field data were collected manually and transferred to spreadsheets. Sample location coordinates were determined and recorded using a handheld GPS and by geotagged photographs.

	<i>Discuss any adjustment to assay data.</i>	The REE assay data were converted from reported elemental assays to the equivalent oxide compound as applicable to rare earth oxides. The oxides were calculated from the element according to the following factors:
		<ul style="list-style-type: none"> <li>• CeO<sub>2</sub> 1.1526</li> <li>• La<sub>2</sub>O<sub>3</sub> 1.1728</li> <li>• Nd<sub>2</sub>O<sub>3</sub> 1.1664</li> <li>• Pr<sub>6</sub>O<sub>11</sub> 1.2082</li> <li>• Dy<sub>2</sub>O<sub>3</sub> 1.1477</li> <li>• Er<sub>2</sub>O<sub>3</sub> 1.1435</li> <li>• Eu<sub>2</sub>O<sub>3</sub> 1.1579</li> <li>• Gd<sub>2</sub>O<sub>3</sub> 1.1526</li> <li>• Ho<sub>2</sub>O<sub>3</sub> 1.1455</li> <li>• Lu<sub>2</sub>O<sub>3</sub> 1.1371</li> <li>• Sm<sub>2</sub>O<sub>3</sub> 1.1596</li> <li>• Tb<sub>2</sub>O<sub>3</sub> 1.1762</li> <li>• Tm<sub>2</sub>O<sub>3</sub> 1.1421</li> <li>• Y<sub>2</sub>O<sub>3</sub> 1.2699</li> <li>• Yb<sub>2</sub>O<sub>3</sub> 1.1387</li> </ul>
<b>Location of data points</b>	<i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i>	All locations determined by handheld GPS using GDA94 datum in UTM Zone 50.
	<i>Specification of the grid system used.</i>	
	<i>Quality and adequacy of topographic control.</i>	
<b>Data spacing and distribution</b>	<i>Data spacing for reporting of Exploration Results.</i>	Sample spacing is on the location of the surface outcrop of pegmatites.
	<i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i>	Sampling type and spacing not designed to be used in an MRE.
	<i>Whether sample compositing has been applied.</i>	No compositing has been applied.
<b>Orientation of data in relation to geological structure</b>	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i>	Sampling was of a reconnaissance nature only and was not designed to achieve unbiased sampling. No drilling reported.
	<i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	No drilling has been undertaken and orientation of structures is unknown.
<b>Sample security</b>	<i>The measures taken to ensure sample security.</i>	All rockchip samples were placed in calico bags, taken to Perth and delivered to ALS laboratory by White Cliff staff.
<b>Audits or reviews</b>	<i>The results of any audits or reviews of sampling techniques and data.</i>	No audits or reviews have been undertaken by White Cliff staff, and unknown for CSIRO.

## Section 2: Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section)

Criteria	JORC Code explanation	Commentary
<b>Mineral tenement and land tenure status</b>	<i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i>	The exploration license applications, ELA09/2641 and ELA09/2628 are held 100% by Electrification Metals Ltd, a wholly owned subsidiary of White Cliff Minerals Ltd. ELA09/2607, ELA09/2608, ELA09/2629 and

Criteria	JORC Code explanation	Commentary
		ELA09/2630 are held 100% by Magnet Resource Company Pty Ltd. The tenements are on the Yinnetharra pastoral station.
	<i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	To the best of Electrification's knowledge, there are no other known impediments to operate on the ELs.
<b>Exploration done by other parties</b>	<i>Acknowledgment and appraisal of exploration by other parties.</i>	Yinnetharra has been explored for Uranium, with limited shallow drilling.
<b>Geology</b>	<i>Deposit type, geological setting and style of mineralisation.</i>	The tenements are located in the Gascoyne centred 200km to the east of Carnarvon. Dominant rock types are medium- to coarse-grained granites, gneisses and migmatites, and crosscutting dolerite dykes. There is extensive sandplain cover in morphologically high areas, colluvium and alluvium dominate around slopes and in drainage.
<b>Drill hole Information</b>	<p><i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i></p> <ul style="list-style-type: none"> <li>• <i>easting and northing of the drill hole collar</i></li> <li>• <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i></li> <li>• <i>dip and azimuth of the hole</i></li> <li>• <i>down hole length and interception depth</i></li> <li>• <i>hole length.</i></li> </ul> <p><i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i></p>	No drilling being reported.
<b>Data aggregation methods</b>	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg. cutting of high grades) and cut-off grades are usually Material and should be stated.</i>	No aggregation methods have been used.
	<i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i>	No aggregation methods have been used.
	<i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>	No metal equivalent values are being used.
<b>Relationship between mineralisation widths and intercept lengths</b>	<i>These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i>	No mineralisation widths have been reported.

Criteria	JORC Code explanation	Commentary
<b>Diagrams</b>	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drillhole collar locations and appropriate sectional views.</i>	Location maps of projects within the release with relevant exploration information contained.
<b>Balanced reporting</b>	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	The reporting of exploration results is considered balanced by the competent person. The locations of rock chip samples will be released once assays are returned from the laboratory.
<b>Other substantive exploration data</b>	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	No other exploration to report.
<b>Further work</b>	<p><i>The nature and scale of planned further work (eg. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></p> <p><i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i></p>	A high Resolution Magnetic and Radiometric survey is to be flown with further surface sampling, mapping and drilling of potential targets.
