

16 November 2022

DRILLING SET TO RECOMMENCE AT 2.5km PARIS GOLD CAMP

Highlights

- 4,500m RC drilling campaign set to commence early next week at the Company's flagship Paris Gold Project.
- The Paris Gold Project sits within the Boulder Lefroy Fault zone and is situated mid-way between the famous Victory and Revenge Gold Camps to the North (>5M oz Au) and the Gold Deposits of Norseman (>5M oz Au) to the South
- The Paris Gold Project has the potential to become a significant Gold Camp hosting several deposits within a broader mineralised system consisting of parallel structures and splays controlled by the Boulder Lefroy System – real Big Pit Potential
- The new drilling will target potential extensions of significant historical gold occurrences along the corridor intersected in previous drilling. Cutting edge targeting using machine learning algorithms combined with new geological models will guide the program
- Drilling is also planned to in-fill and further extend the high-grade gold structure at the Paris Prospect, which in just the past year has been extended from 250m to 900m in strike, with high-grade intercepts including:
 - **30m @ 7.00 g/t Au** from 168m (22PRC040)
 - **27m @ 8.16 g/t Au** from 156m (22PRC038)
 - **24m @ 10.7 g/t Au** from 156m (21PRC025)
 - **17m @ 3.94 g/t Au** from 110m (22PRC044)
- Additional drilling to extend shallow mineralisation at HHH and Observation prospects; significant historical intercepts included:
 - **9m @ 11.6 g/t Au** from 66m (21ORC009)
 - **6m @ 8.45 g/t Au** from 51m (21ORC036)
 - **4m @ 15.86 g/t Au** from 57m (21ORC031)

Western Australian-focused gold explorer Torque Metals Limited (“**Torque**” or “**the Company**”) (**ASX: TOR**) is pleased to announce the re-commencement of drilling at its wholly owned Paris Project, located Southeast of Kalgoorlie on the gold rich Boulder-Lefroy Fault Zone.

Torque Metals plans to execute approximately 4,500m of reverse circulation (RC) drilling over its high-grade gold prospects – Paris, Observation, and HHH - to target significant gold anomalies obtained from historical drilling results, machine learning algorithms, and geological models. It is intended to investigate the link between observation, HHH and Paris prospects, where the Company suspects that the 2,500m NW-SE distance between the two mines contains multiple parallel mineralised gold zones.

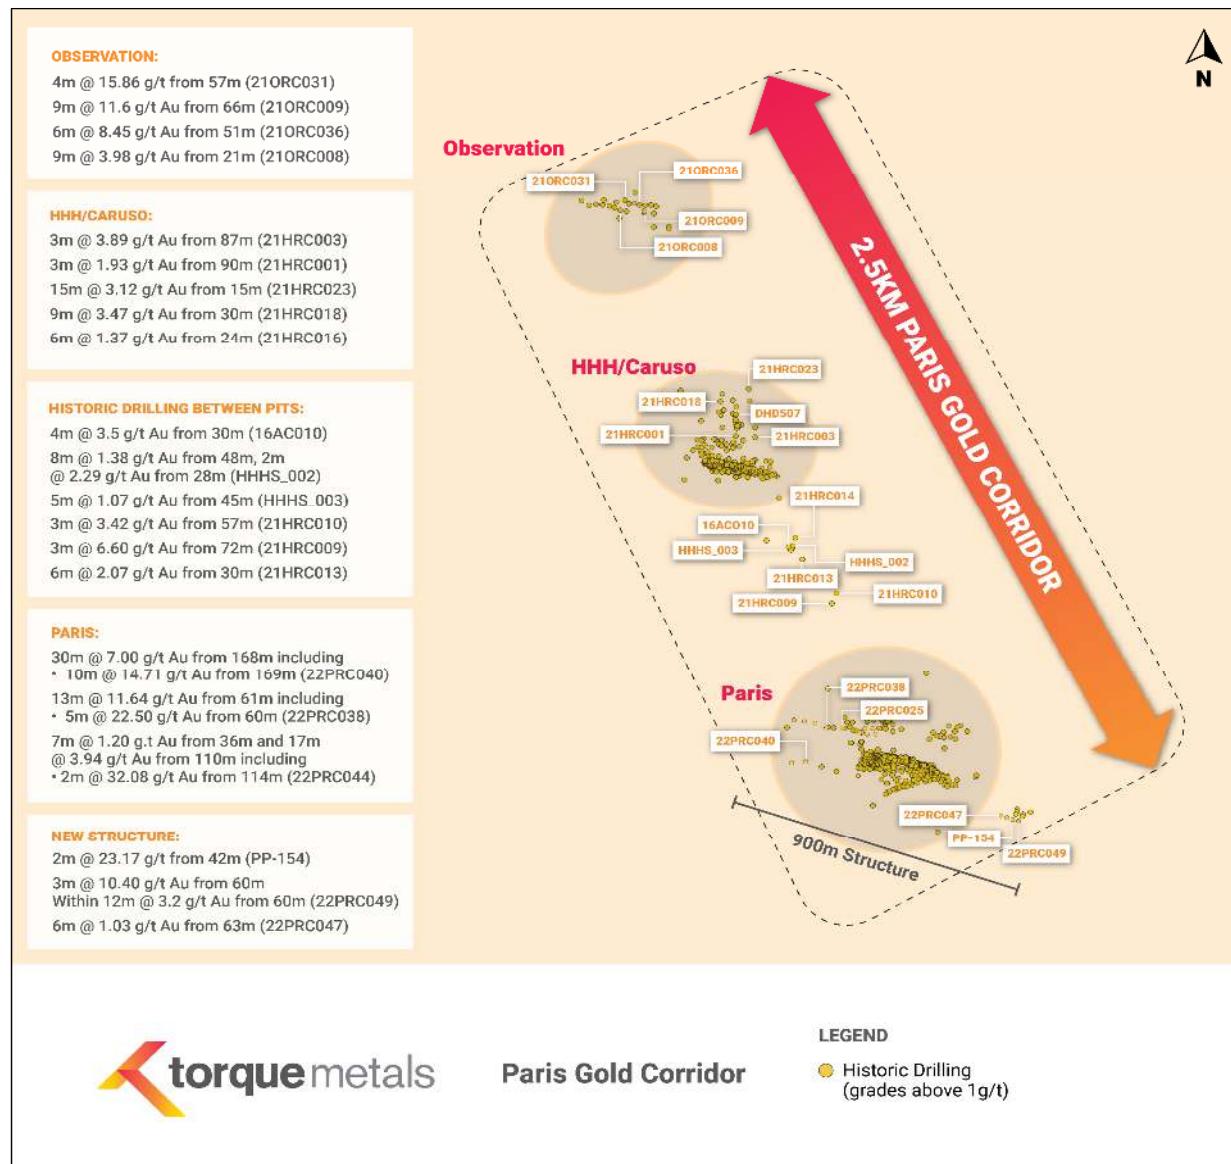

Figure 1: Best grade intersections from multiple prospects along the Paris Gold Corridor

Torque Metals' MD, Cristian Moreno, commented: "We are excited to re-commence drill testing multiple targets for gold mineral systems on the one of the most fertile gold structures on the planet – the Boulder-Lefroy fault. Our campaign intends to extend the already identified high-grade gold structure at the Paris prospect and investigate the potential for several additional high grade development areas across the Observation to Paris corridor.

"Torque historical drilling records, machine learning algorithms, and geological interpretation have shown that potential new mineralised formations, largely parallel to those described at Paris, Observation, and HHH, may occur in the 2,500m NW-SE region between the prospects. To test this model, about 4,500m of RC drilling will be conducted on the Paris Gold corridor.

"Continued discoveries across the WA goldfields show that brownfields exploration around historic operations and following up on open drill intercepts has an amazing potential to uncover new mineralised systems that were missed in previous exploration. Torque is looking forward with great anticipation to what this program uncovers providing investors with assay results as they come to hand."

Drilling at Paris prospect intends to follow-up on the four previous successful exploratory phases since the Company went public approximately one year ago¹. Drilling to date has resulted in new high-grade gold discoveries adjacent to the historic open pit. Among the best outcomes are, but not limited to:

- 22PRC040² **30m @ 7 g/t Au** from 168m, including **10m @ 14.71g/t Au** from 169m
- 22PRC038³ **6m @ 22.0 g/t Au** from 159m and **3m @ 14.0 g/t Au** from 171m, within a larger zone of **27m @ 8.16 g/t Au** from 156m
- 21PRC025⁴ **24m @ 10.7 g/t Au** from 141m, including **6m @ 34.6 g/t Au** from 141m
- 22PRC044² **7m @ 1.20 g/t Au** from 36m and **17m @ 3.94 g/t Au** from 110m including **2m @ 32.08 g/t Au** from 156m

² Refer to ASX announcement dated 29 September 2022 - Paris gold zone grows to ~900m in strike

³ Refer to ASX announcement dated 24 May 2022 - Further wide high-grade gold intercepts at Paris

⁴ Refer to ASX announcement dated 18 October 2021 - New high-grade discovery at Paris gold mine

A further programme of RC drilling is also planned to study the relationship between Observation, HHH, and Paris prospects, where the Company believes the 2,500m NW-SE span between Observation at the northern most extent of the corridor to Paris at the southern end of the corridor offers potential for multiple parallel mineralised gold zones – a concept that is supported by historical drilling, machine learning algorithms, and geological/geophysical models.

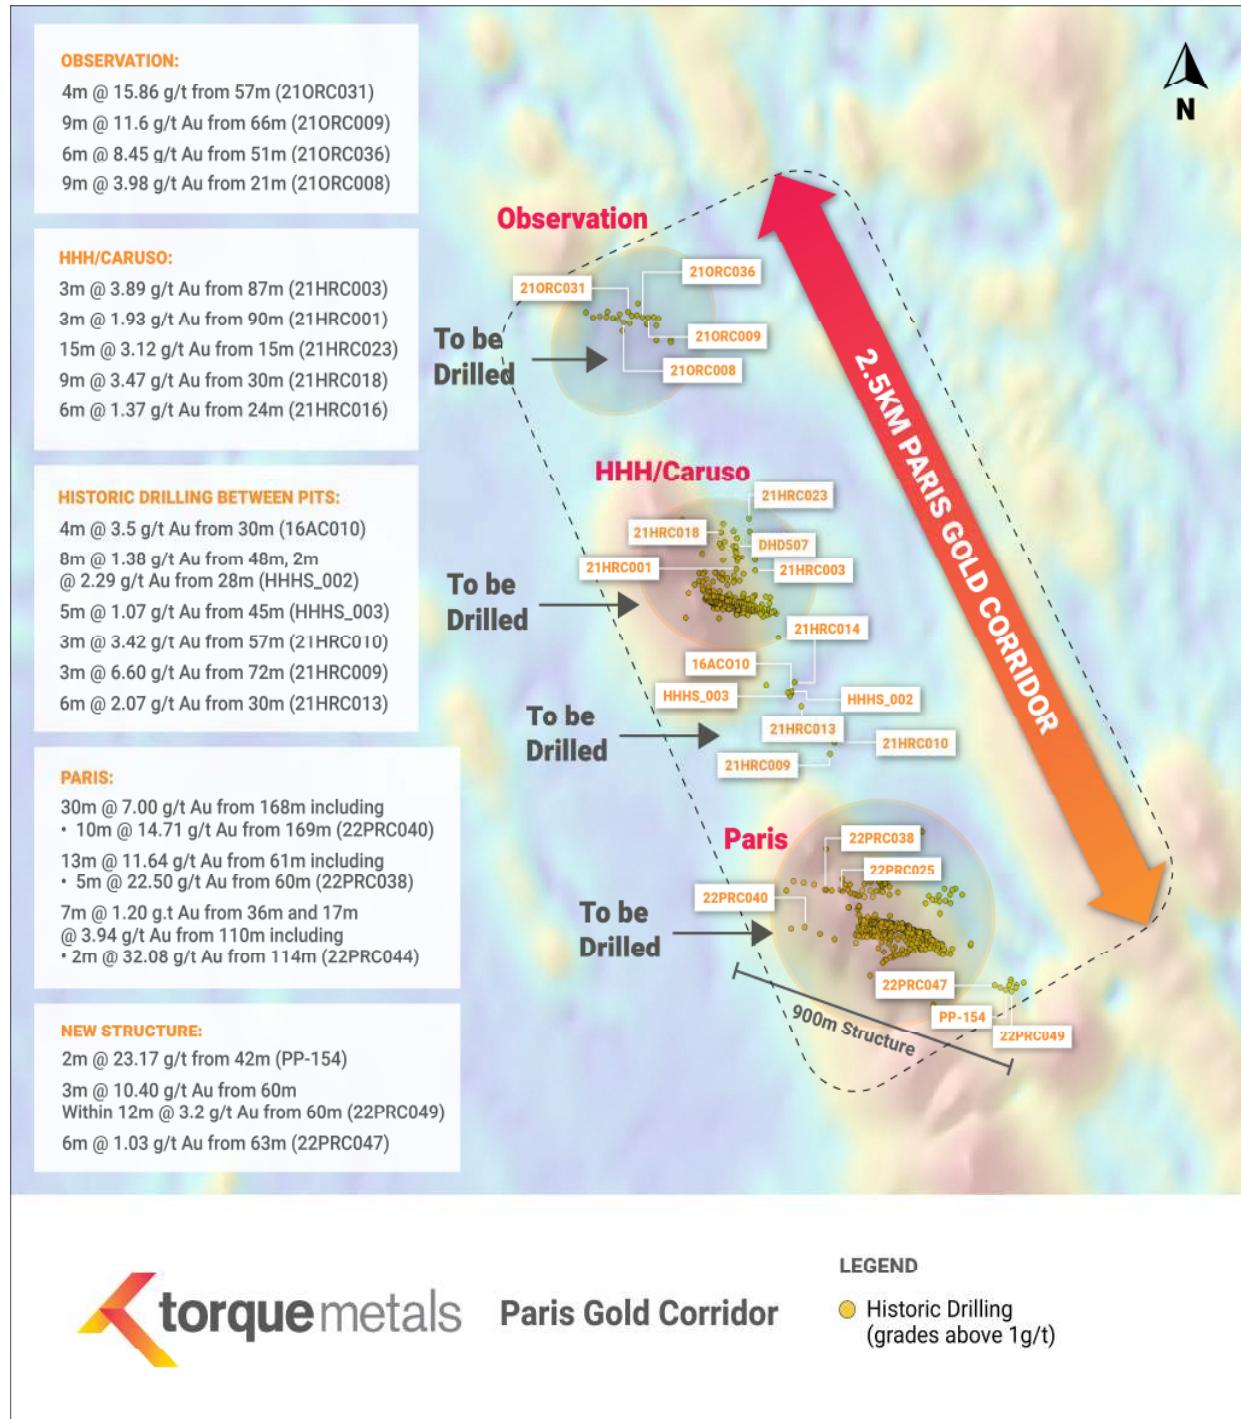

Figure 3: RC Drilling campaign at the “Big pit potential”

Across the “Big pit potential” – 2,500m NW-SE strike length - Significant historical intercepts included:

- **4m @ 3.5 g/t Au** from 30m (16AC010)⁵
- **8m @ 1.38 g/t Au** from 48m, **2m @ 2.29 g/t Au** from 28m (HHHS_002)⁵
- **5m @ 1.07 g/t Au** from 45m (HHHS_003)⁵
- **3m @ 3.42 g/t Au** from 57m (21HRC010)⁴
- **3m @ 6.60 g/t Au** from 72m (21HRC009)⁴
- **6m @ 2.07 g/t Au** from 30m (21HRC013)⁴
- **9m @ 11.6 g/t Au** from 66m (21ORC009)⁶
- **6m @ 8.45 g/t Au** from 51m (21ORC036)⁷
- **4m @ 15.86 g/t Au** from 57m (21ORC031)⁷
- **15m @ 3.12 g/t Au** from 15m (21HRC023)⁸
- **9m @ 3.47 g/t Au** from 30m (21HRC018)⁹

As part of the process to identify new targets in the Paris Project, the Torque Metals technical team has analysed additional gold pathfinder elements such as Arsenic, Silver, Bismuth, Copper, Molybdenum, Tellurium, Antimony, Zinc, and Tungsten; full assay results attached as appendix 2.

About Torque Metals

Torque Metals (ASX:TOR) is a mineral exploration company with an exciting portfolio of high-grade gold deposits in Western Australia. Torque's flagship project is the wholly owned Paris Gold Project, located in the Western Australian Goldfields, 40km NE of the Higginsville gold mine. Torque also holds the Bullfinch Gold Project near the Copperhead mine, approximately 40km north of the town of Southern Cross in WA.

Project Background – The Paris Project

Torque's Paris Project lies within the area known as the Boulder-Lefroy Fault Zone (see figure 4). This prolific gold-bearing structure is host to numerous mines that have produced many millions of ounces of gold, including the world famous "Super Pit" in Kalgoorlie.

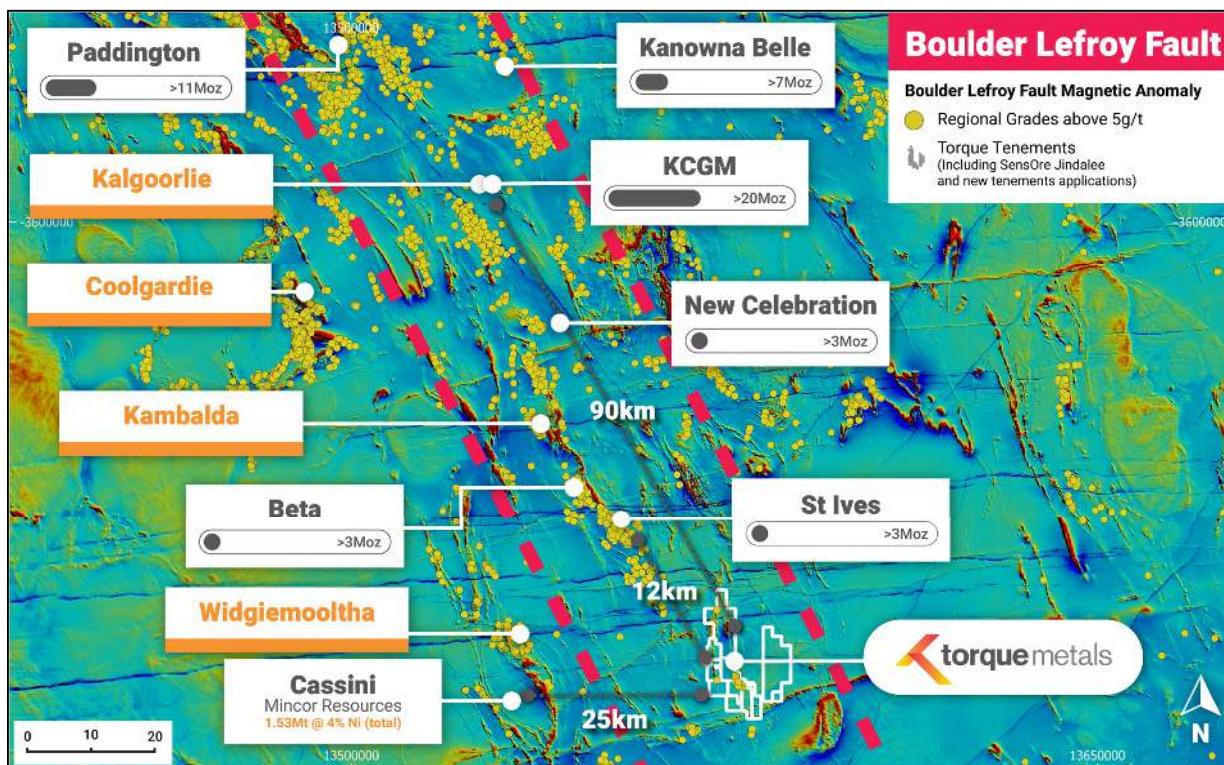

Figure 4: The Paris Project

Torque's Paris Project area remains vastly underexplored, with past drilling generally restricted to the top 100 metres, highlighting significant opportunities for discovery of gold mineralisation by the application of modern-day exploration techniques and the undertaking of more extensive, and deeper, drilling. Since listing on ASX in 2021, Torque has already undertaken three drilling campaigns at Paris with the objective of better defining the zones most likely to rapidly increase the project's gold resource base, so far Torque has explored six different prospects within the "Paris Gold Corridor"⁹ (figure 5).

⁹ Refer to ASX announcement dated 15 March 2022 - Gold Anomalies Provide Evidence of a Paris Gold Corridor

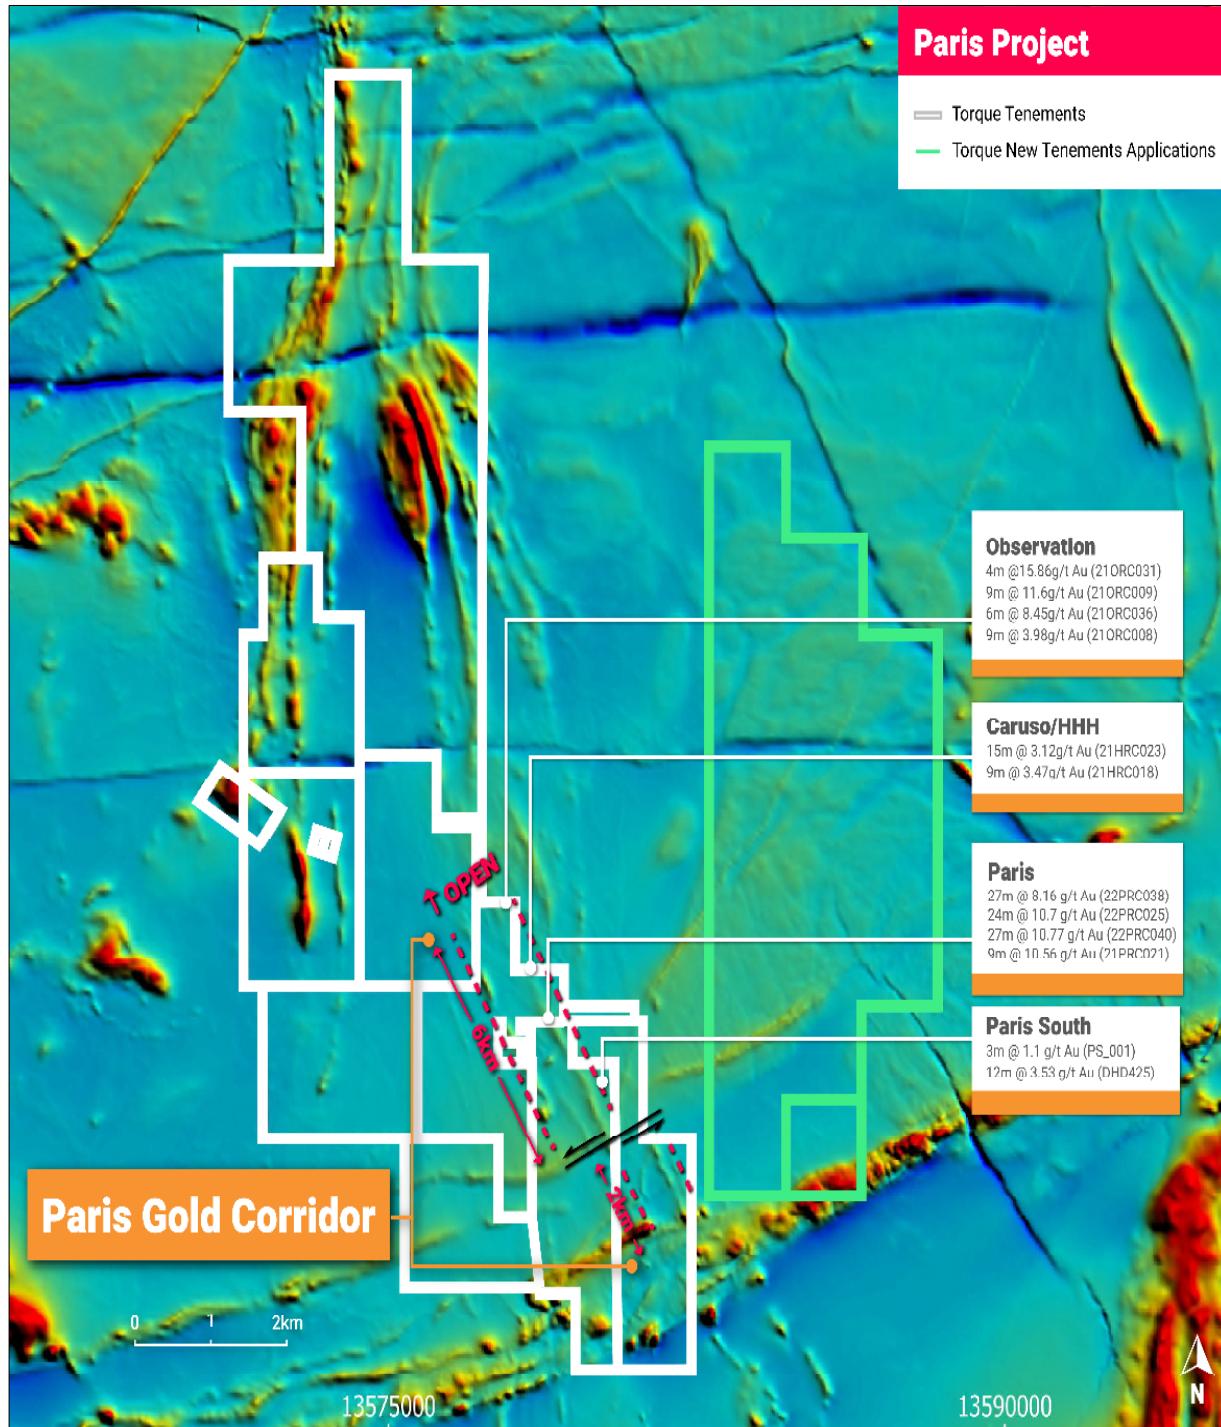

Figure 5: Paris project and Paris Gold Corridor

Competent Person Statement – Exploration Results

The information in this announcement that relates to Exploration Results is based on information compiled by Mr Cristian Moreno, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Moreno is an employee of Torque Metals Limited ("the Company"), is eligible to participate in short and long-term incentive plans in the Company and holds performance rights in the Company as has been previously disclosed. Mr Moreno has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Moreno consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

Forward Looking Statements

This report may contain certain "forward-looking statements" which may not have been based solely on historical facts, but rather may be based on the Company's current expectations about future events and results. Where the Company expresses or implies an expectation or belief as to future events or results, such expectation or belief is expressed in good faith and believed to have a reasonable basis.

However, forward looking statements are subject to risks, uncertainties, assumptions and other factors which could cause actual results to differ materially from future results expressed, projected or implied by such forward-looking statements. Readers should not place undue reliance on forward looking information. The Company does not undertake any obligation to release publicly any revisions to any "forward-looking statement" to reflect events or circumstances after the date of this report, or to reflect the occurrence of unanticipated events, except as may be required under applicable securities laws.

This announcement has been authorised by the board of directors of Torque Metals.

APPENDIX 1: JORC Code, 2012 Edition – Table 1 Exploration Results

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (e.g., cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g., 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g., submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> Assays reported here are all from Reverse Circulation (RC) drill holes. The drilling was to generally accepted industry standards producing 1.0m samples which were collected beneath the cyclone and then passed through a cone splitter. The splitter reject sample was collected into green plastic bags or plastic buckets and laid out on the ground in 20-40m rows. The holes were sampled as initial 3m composites for all prospects using a PVC spear to produce an approximate representative 3kg sample into pre-numbered calico sample bags. Significantly anomalous 3m composites are resampled from the 1m splits and individually assayed. The full length of each hole drilled was sampled. All samples collected are submitted to a contract commercial laboratory. Samples are dried, crushed and homogenised to produce a 40g charge for fire assay and a separate sample for 4- acid digest and 18 multi-element analysis using an Induced Coupled Plasma Mass Spectrometer.
Drilling techniques	<ul style="list-style-type: none"> Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g., core diameter, triple or standard tube, depth of diamond tails, face-sampling bit, or other type, whether core is oriented and if so, by what method, etc). 	<ul style="list-style-type: none"> Holes drilled with a truck mounted T685/KWL700 RC Drilling rig mounted on a Mercedes 8 x 8 with a 500psi/1350cfm Onboard Compressor supplied by Strike Drilling and Blue Spec. Relevant support vehicles were provided. A 145mm (5.5in) face-sampling drilling bit was used.
Drill sample recovery	<ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> Samples were not individually weighed or measured for recovery. An experienced Company geologist monitored the sampling process. Any issues were immediately rectified. Sample recovery was recorded by the Company Field Assistant based on how much of the sample is returned from the cyclone and cone splitter. This is recorded as good, fair, poor or no sample. Torque is satisfied that the RC holes have taken a sufficiently representative sample of the interval and minimal loss of fines has occurred in the RC drilling resulting in minimal sample bias. No twin RC drill holes have been completed to assess sample bias. At this stage no investigations have been made into whether there is a relationship between sample recovery and grade.
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a 	<ul style="list-style-type: none"> All the 1m RC samples were sieved and collected into 20m chip trays for geological logging of colour,

	<p><i>level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></p> <ul style="list-style-type: none"> • <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> • <i>The total length and percentage of the relevant intersections logged.</i> 	<p>weathering, lithology, alteration and mineralisation for potential Mineral Resource estimation and mining studies.</p> <ul style="list-style-type: none"> • RC logging is both qualitative and quantitative in nature. • The total length of the RC holes was logged. Where no sample was returned due to cavities/voids it was recorded as such.
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> • <i>If core, whether cut or sawn and whether quarter, half or all cores taken.</i> • <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> • <i>For all sample types, the nature, quality, and appropriateness of the sample preparation technique.</i> • <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> • <i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i> • <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> 	<ul style="list-style-type: none"> • Sampling technique: <ul style="list-style-type: none"> • All RC samples were collected from the RC rig and were collected beneath the cyclone and then passed through the cone splitter. • The samples were generally dry, and all attempts were made to ensure the collected samples were dry. However, on deeper portions of some of the drillholes some samples were logged as moist and/or wet. • The cyclone and cone splitter were cleaned with compressed air at the end of every completed hole. • The sample sizes were appropriate to correctly represent the mineralisation based on the style of mineralisation, the thickness and consistency of intersections, the sampling methodology and percent value assay ranges for the primary elements. • Quality Control Procedures <ul style="list-style-type: none"> • A duplicate sample was collected every hole. • Certified Reference Material (CRM) samples were inserted in the field every approximately 50 samples containing a range of gold and base metal values. • Blank washed sand material was inserted in the field every approximately 50 samples. • Overall QAQC insertion rate of 1:10 samples • Laboratory repeats taken and standards inserted at pre-determined level specified by the laboratory. • Sample preparation in the Bureau Veritas (Canning Vale, Western Australia) laboratory: The samples are weighed dried for a minimum of 12 hours at 1000C, then crushed to -2mm using a jaw crusher, and pulverised by LM5 or disc pulveriser to -75 microns for a 40g Lead collection fire assay to create a homogeneous sub-sample. The pulp samples were also analysed with 4 acid digest induced Coupled Plasma Mass Spectrometer for 18 multi-elements • The sample sizes are considered appropriate to correctly represent the mineralisation being targeted
<i>Quality of assay data and laboratory tests</i>	<ul style="list-style-type: none"> • <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> • <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the</i> 	<ul style="list-style-type: none"> • Duplicates and samples containing standards are included in the analyses.

	<p><i>analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></p> <ul style="list-style-type: none"> <i>Nature of quality control procedures adopted (e.g., standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i> 	
<i>Verification of sampling and assaying</i>	<ul style="list-style-type: none"> <i>The verification of significant intersections by either independent or alternative company personnel.</i> <i>The use of twinned holes.</i> <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> <i>Discuss any adjustment to assay data.</i> 	<ul style="list-style-type: none"> Significant intersections have been independently verified by alternative company personnel. The use of twinned holes has not been implemented and is not considered necessary at this stage of exploration. The Competent Person has visited the site and supervised all the drilling and sampling process in the field. All primary data related to logging and sampling are captured into Excel templates on palmtops or laptops. All paper copies of data have been stored. All data is sent to Perth and stored in the centralised Access database with a Microsoft SQL front end which is managed by a qualified database geologist. No adjustments or calibrations have been made to any assay data, apart from resetting below detection values to half positive detection.
<i>Location of data points</i>	<ul style="list-style-type: none"> <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> <i>Specification of the grid system used.</i> <i>Quality and adequacy of topographic control.</i> 	<ul style="list-style-type: none"> All collars were initially located by a Geologist using a conventional hand-held GPS. Following completion of the drilling the hole collars will be independently surveyed by surveyors using a differential GPS for accurate collar location and RL with the digital data entered directly into the company database. Downhole surveys are being completed on all the RC drill holes by the drillers. They used a True North seeking Gyro downhole tool to collect the surveys approximately every 10m down the hole. The grid system for the Paris Project is MGA_GDA94 Zone 51. Topographic data is collected by a hand-held GPS.
<i>Data spacing and distribution</i>	<ul style="list-style-type: none"> <i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> <i>Whether sample compositing has been applied.</i> 	<ul style="list-style-type: none"> Varying drill spacing and drillhole orientation is likely until geological orientations and attitude of mineralisation can be established with a suitable degree of certainty The drill spacing is generally not sufficient to establish the degree of geological and grade continuity applied under the 2012 JORC code for the estimation of Mineral Resources. Sample compositing has been applied to this drilling programme with 1m samples collected and submitted to the laboratory as 3m composites.
<i>Orientation of data in relation to geological structure</i>	<ul style="list-style-type: none"> <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> 	<ul style="list-style-type: none"> The attitude of the lithological units is predominantly North - South dipping to sub-vertical however at the Paris Project mineralised structures are often oriented on an approximately 290-degree orientation. Investigation of the presence of possible Riedel structures had meant that several drillhole azimuth orientations have been used to generate further technical information and to intersect specific mineralised structures, but always with an attempt to drill orthogonal to the strike of the interpreted structure. Due to locally varying intersection angles

		<p>between drillholes and lithological units all results are defined as downhole widths. True widths are not yet known.</p> <ul style="list-style-type: none"> No drilling orientation and sampling bias has been recognised at this time and it is not considered to have introduced a sampling bias.
Sample security	<ul style="list-style-type: none"> <i>The measures taken to ensure sample security.</i> 	<ul style="list-style-type: none"> Samples are placed in calico bags and transported to the relevant Perth or Kalgoorlie laboratory by courier or company field personnel. Security was not considered a significant risk.
Audits or reviews	<ul style="list-style-type: none"> <i>The results of any audits or reviews of sampling techniques and data.</i> 	<ul style="list-style-type: none"> The Company database was originally compiled from primary data by independent database consultants based on original assay data and historical database compilations. Data is now managed by suitably qualified in-house personnel. No review or audit of the data and sampling techniques has been completed.

Section 2 Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> 	<ul style="list-style-type: none"> The relevant tenements (M15/498, M15/497, M15/496) are 100% owned by and registered to Torque Metals Limited. At the time of reporting, there are no known impediments to obtaining a licence to operate in the area and the tenements are in good standing.
Exploration done by other parties	<ul style="list-style-type: none"> <i>Acknowledgment and appraisal of exploration by other parties.</i> 	<ul style="list-style-type: none"> In 1920, Paris Gold Mine Company was floated in Adelaide to take up a 12-month option over the mine area. Just to the south, another company had an option over the Paris South Gold Mine, but soon abandoned it to focus attention on the Observation Gold Mine, 1 km to the north, which it abandoned in turn after only one month. The Paris Mine at the time contained 5 shafts and 2 costeans. Gold was said to be erratic in a quartz, schist, jasper lode jumbled by faults. At some point it was excavated as an open pit. Western Mining Corporation (WMC) started to explore the Paris area in the 1960s and relied on aerial magnetics supported by geological mapping to assess mineralisation potential. This work identified the basalt/gabbro contact as the major control for Paris style gold-copper mineralisation and extensions to the ultramafic units that host the nickel mineralisation around the Kambalda Dome. In the early 1970s the area was the focus of both nickel and copper-zinc exploration. Reconnaissance diamond drilling for nickel was undertaken by WMC that drilled on 5 lines spaced at 800m across the interpreted basal contact position of the Democrat Hill Ultramafic and the BLF. The basal contact of the Kambalda Komatiite (and equivalents) is host to all the nickel mines in the Kambalda district and is the primary exploration area of interest for nickel

		<p>mineralisation. Base metal exploration involved reconnaissance mapping, gossan search, soil, and stream sediment sampling. In 1973, DHD 101 was drilled to follow up a copper anomaly on the Democratic Shale. Results showed the anomalous gossan values to be associated with a sulphidic shale with values in the range 0.1 to 0.2% Cu and 0.8-1.0% Zn. During the early 1980s, Esso Exploration Australia and Aztec Exploration Limited conducted exploration programs along strike from the Paris Mine. Primary area of interest was copper-zinc-(gold) mineralisation in the felsic volcanics. Work included geochemistry, geophysics, and drilling. The Boundary gossan was discovered, and later drill tested with a single diamond hole in 1984. This hole failed to locate the primary source of the anomalous surface geochemistry.</p> <ul style="list-style-type: none"> • In 1988, Julia Mines conducted an intensive drilling program comprising air core, RC and diamond holes concentrated around the Paris Mine. This work was successful in delineating extensions and parallel lodes to the known Paris mineralisation. both along strike and down plunge. Paris Gold Mine was developed and worked in 1989 by Julia Mines and produced 24koz gold, 17koz silver and 245t copper. Estimated recovered gold grade was 11.2g/t. • In 1989/90, WMC completed a six-hole diamond drilling program to test for depth extensions to the Paris mineralisation below the 180m depth. Results defined a narrow (1-2m) high-grade zone over 70m of strike and intersected hanging wall lodes 10m and 30m stratigraphically above the interpreted main lode. This was the last drilling program to be carried out on the Paris Mine by WMC. From 1994 to 1999, WMC focussed their gold resource definition drilling on the HHH deposit and conducted a series of RC drilling campaigns resulting in 30m drill line spacings with holes every 10m to 20m along the lines. Elsewhere, exploration by WMC and later by St Ives Gold Mining Company identified several areas of interest based on favourable structural and geochemistry evaluations. The 7km x 1km long N-S trending soil anomaly at Strauss was systematically drill tested in 2000 and yielded encouraging results associated with the Butcher's Well Dolerite. Air core drilling in 2005 focussed on the southern strike extensions of the mineralisation discovered in the 2000 program with limited success. • Gold Fields Australia (St Ives Gold Mining Company) explored the area in 2008. The Paris and HHH deposits were tested as part of the SIGMC's broader air core program. The drilling (148 holes, 640m x 80m) focussed on poorly exposed differentiated dolerite proximal to interpreted intrusive. The exploration potential was supported by a structural interpretation which highlighted strong NNW trending magnetic features with the apparent intersection of crustal-scale lineaments observed in the regional gravity images. Anomalous values are associated with a felsic intrusive hosted by a sediment on the western margin of the area of interest. • Austral Pacific Pty Ltd acquired the Paris Gold
--	--	---

		<p>Project from SIGMC in July 2015. Mineral Resource and Reserve estimates were compiled in-house and exploitation of the Paris and HHH deposits focussed on a staged approach with near term gold production as a priority and near mine exploration to follow.</p>
Geology	<ul style="list-style-type: none"> Deposit type, geological setting, and style of mineralisation. 	<ul style="list-style-type: none"> The Paris Gold Project covers a north-south trending belt of Archaean granite-greenstone terrain, and most of the package is currently situated to the east of the Boulder Lefroy Structural Zone (BLSZ). Consequently, the Parker Domain dominates the project geology, defined as existing east of the BLFZ and bounded to the east by the Mount Monger Fault. The Parker Domain comprises a series of ultramafic and mafic units interlayered with felsic volcanoclastic and sediments. The stratigraphic sequence is like the Kambalda Domain. Gold mineralisation is widespread, occurring in almost all parts of the craton, but almost entirely restricted to the supracrustal belts. Gold occurs as structurally and host-rock controlled lodes, sharply bounded high-grade quartz veins and associated lower-grade haloes of sulphide-altered wall rock. Mineralisation occurs in all rock types, although Fe-rich dolerite and basalt are the most common, and large granitic bodies are the least common hosts. Most deposits are accompanied by significant alteration, generally comprising an outer carbonate halo, intermediate to proximal potassio-mica and inner sulphide zones. The principal control on gold mineralisation is structure, at different scales, constraining both fluid flow and deposition positions.
Drill hole Information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth AND hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<ul style="list-style-type: none"> All relevant information for the drillholes reported in this announcement has been previously reported in announcements dated: <ul style="list-style-type: none"> 23-Jun-2021 18-Aug-2021 18-Oct-2021 20-Jan-2022 27-Jan-2022 21-Feb-2022 15-Mar-2022 24-May-2022 13-Jul-2022 08-Sep-2022 29-Sep-2022
Data aggregation methods	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of 	<ul style="list-style-type: none"> No high-grade cuts have been applied to the reporting of exploration results. No metal equivalent values have been used.

	<i>metal equivalent values should be clearly stated.</i>	
<i>Relationship between mineralisation widths and intercept lengths</i>	<ul style="list-style-type: none"> <i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g., 'down hole length, true width not known').</i> 	<ul style="list-style-type: none"> As this programme was a relatively early-stage exploration drill programme across several prospects there was considerable variation in the drill spacing and hole orientation. Due to locally varying intersection angles between drill holes and lithological units all results are defined as downhole widths and reported as downhole widths. Insufficient knowledge of the structural controls on the mineralisation and attitude of the mineralised horizons is known yet to allow true widths to be established. This drill spacing is also not sufficient to establish the degree of geological and grade continuity applied under the 2012 JORC Code.
<i>Diagrams</i>	<ul style="list-style-type: none"> <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> 	<ul style="list-style-type: none"> Appropriate maps and sections for any significant discovery are included in this announcement.
<i>Balanced reporting</i>	<ul style="list-style-type: none"> <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced avoiding misleading reporting of Exploration Results.</i> 	<ul style="list-style-type: none"> All significant intercepts and summaries of relevant drill hole assay information have been previously reported in the ASX announcements dated 23 June 2021, 29 September 2022, 24 May 2022, 18 October 2021, 18 August 2021, 20 January 2022, 27 January 2022, 13 July 2022, 15 March 2022 and BMGS report dated November 2016 - A report on the august 2016 Paris grade control and satellite exploration program
<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> 	<ul style="list-style-type: none"> All meaningful and material information has been included in the body of this announcement.
<i>Further work</i>	<ul style="list-style-type: none"> <i>The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	<ul style="list-style-type: none"> Refer to this announcement. The extent of follow-up drilling has not yet been confirmed but will likely include further RC and possibly diamond drilling.

APPENDIX 2: Laboratory assay results: Multielement analysis using an Induced Coupled Plasma Mass Spectrometer - 3m split

All elements recorded in the following table are measured in parts per million (ppm)
