Strong Rare Earths anomalous identified at Mt Cattlin Gold-Copper Project

Auger geochemical sampling shows strong Rare Earth Element anomalous at surface associated with buried intrusives

Key Points:

- Anomalous Rare Earth Elements (REE) mineralisation identified in auger geochemical sampling previously undertaken for the purposes of Geochemical Footprint Modelling at Mt Cattlin.
- REE results indicate that the intrusive complex, which hosts the mineralisation at Mt Cattlin, may include alkali-rich intrusive-like carbonatites, which are the most significant hard-rock source of REE. This hypothesis is supported by the previous recognition of fenite alteration, which is characteristically located on the margins of carbonatites.
- A deep diamond drilling program, supported by EIS funding, is currently being planned to test several targets. These drill-holes will test the gold-copper potential within the multi-phase intrusive complex, while also assessing the overlapping REE potential.
- Several REE anomalous trends have been highlighted, which are partly aligned with dominant north-east-trending structures and overlying buried intrusions.
- Air-core drilling is also planned to test the near-surface REE ionic clay potential at Mt Cattlin.

Traka Resources Limited (ASX: **TKL**, Traka or the Company) is pleased to advise that significant Rare Earth Element anomalous has been detected in auger geochemical samples collected from the Company's 100%-owned **Mt Cattlin Gold-Copper Project** in south-west Western Australia.

The samples were collected earlier this year to assist with Geochemical Footprint Modelling of the gold and copper potential at Mt Cattlin (1).

Ongoing evaluation of the data, further sampling and additional assay is underway, however the Company believes that the REE mineralisation may be associated with carbonatite intrusives within the multi-phase Mt Cattlin intrusive complex. This view is supported by the previous observation of fenite alteration in drill holes and mapping, with this type of alteration typically found on the margins of carbonatite intrusives (2).

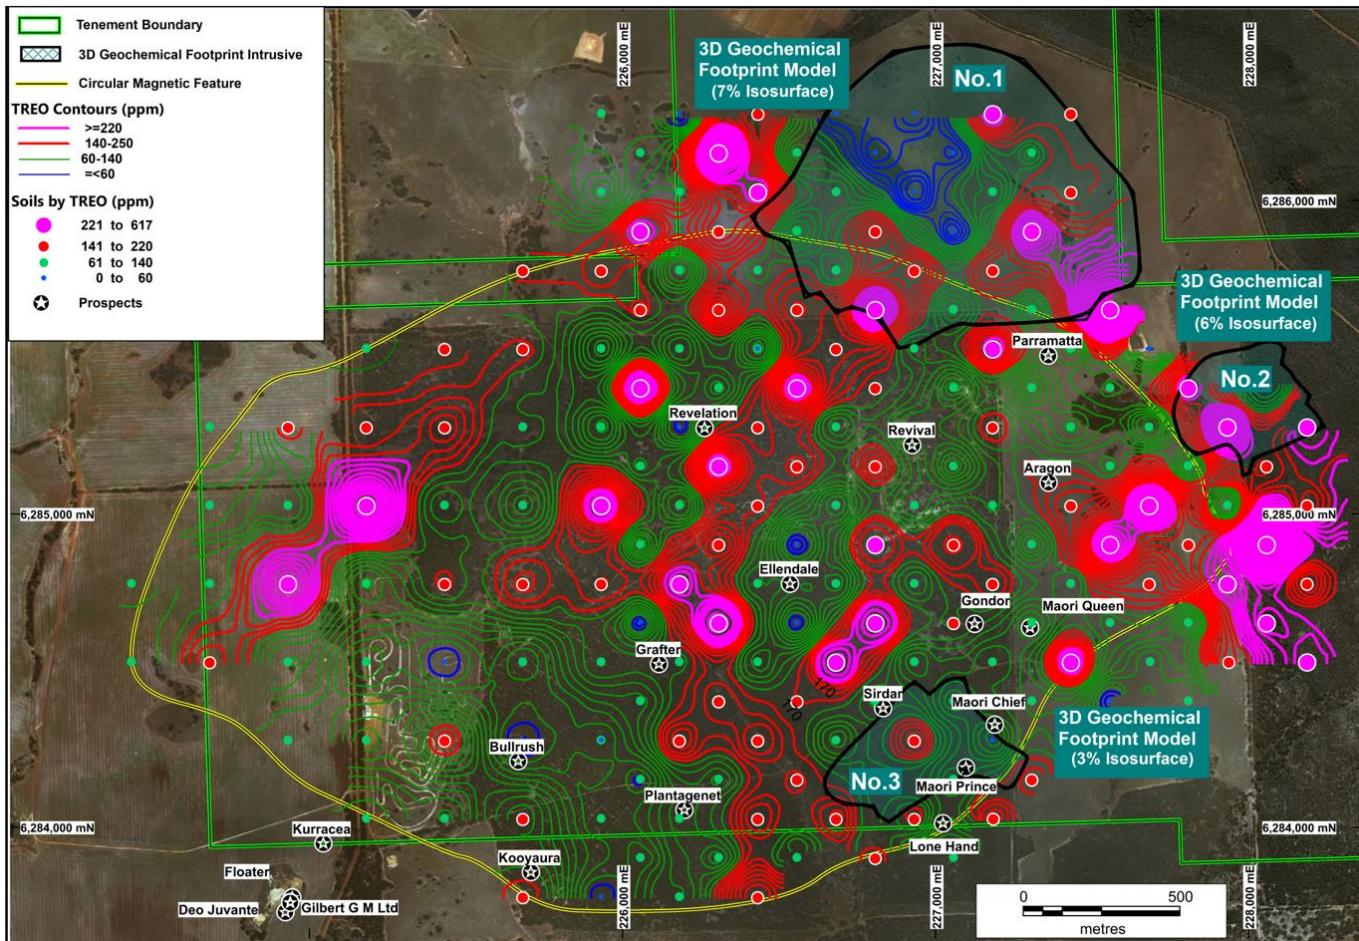

Figure 1. A geochemical plan view showing TREO anomalousness over the Mt Cattlin intrusive complex. Several north-east trending anomalous zones are parallel but offset to the mineralised gold-copper structures which include porphyries that host the various gold-copper mines and prospects. A large anomaly to the north-east of the Maori Queen Resource overlies one of the buried footprint modelling intrusive.

The REE geochemical results, depicted as TREO (Total Rare Earth Oxide), highlight anomalies predominantly in the north-east trend, partly coincident with mineralised structures and the buried gold-copper targets which have been the focus of Traka's previous exploration (Figure 1).

All the anomalies occur with the boundaries of the multi-phase and strongly hydrothermally altered intrusive complex.

Additional sampling for REE, including air-core drilling of the anomalies, is currently being considered to obtain profile data through the ionic clay potential in the weathered regolith zone. In addition, two deep diamond drill holes are planned to test the bedrock core of the intrusive complex. These deep diamond holes will test the positions of the buried gold-copper intrusives previously highlighted, as well as providing the opportunity to test for REE-rich carbonatite intrusives. An EIS (Exploration Incentive Scheme) co-funding grant of \$220,000 is being applied to these drill-holes (3).

The geochemistry data comprised bottom-of-hole auger samples (0.5 to 1.0m deep) with the ultrafine clay fraction (-7µm) assayed for REE (Table 1). The full oxidised regolith profile that would host the supergene enriched REE ionic clay potential, which is typically in the range of 5 to 25 metres deep, is yet to be tested but will be prioritised below the peak near-surface auger base anomalies. Several of these anomalies extend over 2km each and extend beyond the limits of the auger sampling program. The peak TREO anomalousness was 617ppm, which is several orders of magnitude above background potential.

A full description of the data and sampling details is provided in the Annexure: JORC Table 1.

Management Comment

Traka's Managing Director, Patrick Verbeek, said:

"This is a very exciting development that further upgrades the prospectivity of the Mt Cattlin Project, indicating compelling potential for Rare Earth Elements alongside the known gold-copper mineralisation.

"The planned deep diamond drill-holes will test the buried intrusive complex for both opportunities, with a program of air-core drilling also being considered to test for REE's closer to surface within the regolith profile.

"What is most exciting is that we already have early evidence for underlying hard rock alkali intrusives – with fenite alteration observed in several drill holes – and a very favourable geological setting for REE mineralisation."

Authorised by the Board.

COMPLIANCE STATEMENT

The information in this report that relates to Exploration Targets, Exploration Results, Mineral Resources or Ore Reserves is based on information compiled by Mr P Verbeek who is the Managing Director of Traka Resources Limited. Mr Verbeek, who is a Competent Person and a Member of the Australasian Institute of Mining and Metallurgy, has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Verbeek consents to the inclusion in this report of the matters based on the information in the form and context in which it appears.

*TREO (Total Rare Earth Oxide) = La₂O₃ + CeO₂ + Pr₆O₁₁ + Nd₂O₃ + Sm₂O₃ + Eu₂O₃ + Lu₂O₃+Gd₂O₃ + Tb₄O₇ + Dy₂O₃ + Ho₂O₃ + Er₂O₃ + Tm₂O₃ + Yb₂O₃ + Y₂O₃

*LREO (Light Rare Earth Oxide) = La₂O₃ + CeO₃ + Pr₂O₃ + Nd₂O₃ + Sm₂O₃

*HREO (Heavy Rare Earth Oxide) = Eu₂O₃ + Gd₂O₃ + Tb₂O₃ + Dy₂O₃ + Ho₂O₃ + Er₂O₃ + Tm₂O₃ + Yb₂O₃ + Y₂O₃ + Lu₂O₃

*MREO (Magnetic Rare Earth Oxide) = Pr₂O₃ + Nd₂O₃ + Sm₂O₃ + Gd₂O₃ + Tb₂O₃ + Dy₂O₃

Annexure: JORC Table 1

Section 1: Sampling Techniques and Data for the Mt Cattlin Gold Copper Project

Criteria	JORC Code explanation	Commentary
Sampling Techniques	<ul style="list-style-type: none"> Nature and quality of sampling 	<ul style="list-style-type: none"> Soil geochemical samples used for low detection level multi-element analysis are collected at the bottom of auger holes between 0.5 to 1.0m depth. A 200g -2mm fraction of the auger sample is submitted to the laboratory for extraction of the -7micron ultra fine fraction. The residue and pulps of these samples are retained in the event additional sampling or check sampling is required.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial of total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	<ul style="list-style-type: none"> The QA/QC data includes laboratory standards, duplicates and checks. The -7-micron geochemical samples are dissolved by 4 acid digest and analysis undertaken by ICP_MS for 61 elements. Duplicate samples from each batch of samples submitted to the laboratory are submitted to verify consistency of assay results LabWest Minerals Analysis undertakes the sample preparation and analysis.
Verification of sampling and assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	<ul style="list-style-type: none"> All geochemical sampling is undertaken under the supervision of an experience Geologist and the Managing Director. Experienced field personnel and the application of formal comprehensive cross-check systems ensure the accuracy of sampling. All sample locations and assay data is uploaded, checked for validity and entered into the Company's relational database. Electronic copies of all the data is backed up daily in Traka's office. No adjustments of assay data are considered necessary. Conversion of elemental analysis (REE parts per million) to oxide (REO parts per million) was using the below element to oxide conversion factors

Criteria	JORC Code explanation	Commentary		
		Element	Oxide	Conversion Factor
		Cerium	CeO ₂	1.2284
		Dysprosium	Dy ₂ O ₃	1.1477
		Erbium	Er ₂ O ₃	1.1435
		Europium	Eu ₂ O ₃	1.1579
		Gadolinium	Gd ₂ O ₃	1.1526
		Holmium	Ho ₂ O ₃	1.1455
		Lanthanum	La ₂ O ₃	1.1728
		Lutetium	Lu ₂ O ₃	1.1371
		Neodymium	Nd ₂ O ₃	1.1664
		Praseodymium	Pr ₆ O ₁₁	1.2082
		Samarium	Sm ₂ O ₃	1.1596
		Terbium	Tb ₂ O ₃	1.151
		Yttrium	Y ₂ O ₃	1.2699
		Ytterbium	Yb ₂ O ₃	1.1387
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. 	<ul style="list-style-type: none"> Hand-held GPS is used to locate all geochemical sampling positions. Calibration and cross reference to orthophotos, topographic and geological maps are used as a cross reference to the GPS calculated position. The GDA94 Zone 51 datum is used the co-ordinate system. 		
Data spacing and distribution	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resources and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	<ul style="list-style-type: none"> Geochemical spacing for the low level multi-element geochemical survey was 250m x 250m square now being expanded and infilled in areas of interest. A second infill sampling program at 125m x 125m spacing was undertaken and the data for the original compared for continuity and then merged. 		
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> Geochemical samples entirely encompass a 3.5km wide elliptical zone define by interpretation of aeromagnetics and all within the Mt Cattlin tenement boundary. 		
Sample security	<ul style="list-style-type: none"> The measure taken to ensure sample security. 	<ul style="list-style-type: none"> Samples are uniquely numbered and individually bagged for submission to the Laboratory. The nature and position of each sample is recorded on a notebook and GPS and this data subsequently entered into a secure data base. Detailed records are kept of all samples that are dispatched, including details of chain of custody. 		
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> Data is validated when loading into the database. No formal external audit has been conducted. The 3D geochemical footprint modelling method assumes the presence of a mineralised intrusive with a typical alteration halo and associated geochemical footprint. The model is moved in space to best fit the data. Independent expert consultants with appropriate experience in this methodology have been used to assist with the 3D model produced. 		

Section 2 – Reporting of Exploration Results for the Mount Mt Cattlin North Gold Project

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> The Mount Cattlin Gold Project is located on EL74/401, PL74/373 and PL74/370 Ltd. An agreement with Galaxy gives Traka the right to gold and all other commodities on these tenements. Access Agreement have been entered into with the relevant landowners and all work is done with their permission.
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgement and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> The source of historic data has been acknowledged and its validity comprehensively checked before use in the project assessment
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> This style mineralisation being evaluated is Archean aged shear and intrusive related gold and copper mineralisation.
Diagrams	<ul style="list-style-type: none"> Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<ul style="list-style-type: none"> Refer to Figures in the body of text.
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of exploration results. 	<ul style="list-style-type: none"> All relevant information is reported for a project at an early exploration level of evaluation.
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> An Aeromagnetic Survey was undertaken by MAGSPEC Airborne Surveys under the supervision of Geophysicists from Explore Geo Pty Ltd. <p>Survey Specifications:</p> <p>Aircraft - Cessna 206 VH-HIS Data Acquisition – sample rate 20Hz (3.5m), Novatel OEM DGPS, High Precision caesium vapour magnetometer G-823A with 3 -axis fluxgate compensation Gamma-Ray spectrometer - RSI RS-500 with 2 x RSX 4 detector packs Base Station - GEM GSM-19 sampling at 1 second was used for all corrections. Navigation – Novatel OEM719 DGPS receiver</p> <p>The MobileMT survey completed at Mt Cattlin was undertaken by Expert Geophysics using a Bell 206 Long Ranger helicopter.</p> <ul style="list-style-type: none"> Flight lines were east-west 200m apart for a total of 122km. The helicopter was flown at about 140 -150m above surface and the Mobile MT bird hung below to about 40m to 60m above surface Electromagnetic data was recorded at 73,728Hz and processed 2 times every second to achieve about 11m sample interval along the line at the 80-100km/hr flight speed. Airborne magnetic data was recorded at 10Hz resulting in data every 2.2m along line

Criteria	JORC Code explanation	Commentary
		<ul style="list-style-type: none"> • The following instrument were used <ul style="list-style-type: none"> - MOBILEMT towed bird - Geometrics G822A Cesium Magnetometer - EGGPS navigation system - Smartmicro UMRR 0A altimeter <p>Processing of the Mobile MT data was completed by independent experts CompGeoINC. Full validation and processing of the MOBILMT data was completed and plotted using GDA94 MGA UTM 51 datum. A full inversion of the data was completed enabling CGI's proprietary EM/MT program.</p> <p>Supervision of the MobileMT survey and subsequent processing of the results was completed by Traka's independent Geophysical Consultant Kim Frankcombe (ExploreGeo)</p>
Further work	<ul style="list-style-type: none"> • The nature and scale of planned further work (eg test for lateral extensions or depth extensions or large-scale step-out drilling). • Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<ul style="list-style-type: none"> • The assessment of data is ongoing. • Future work will include drilling to test the know and new targets • Diagrams with explanatory comments are presented as they come to hand and are reported.
