## ASX Announcement

December 5 2022

ASX:BCA

## Manganese Sulphate Testwork Achieves Greater than 99% Purity

- Highly encouraging results from initial sighter test work on Flanagan Bore manganese oxide samples confirm the potential to produce **High Purity Manganese Sulphate Monohydrate (HPMSM)** suitable for the battery manufacturing industry
- Initial leach tests yielded a 91% extraction rate from which **high-grade Manganese Sulphate crystals containing 32.3% Mn** were produced, equivalent to **greater than 99% Manganese Sulphate purity**
- The sighter result successfully demonstrate the suitability of manganese oxide ores to generate downstream manganese products potentially suitable for battery related cathode active materials and agricultural applications
- The Company is advancing Scoping Level leaching, purification and crystallising testwork programs as part of the overall strategy to add value through the potential production of **HPMSM as a precursor material for cathodes** used in the growing electric vehicle battery market
- Black Canyon has established a large Mineral Resource base to potentially develop a **multi-decade mining operation that could supply manganese oxide concentrates used as alloys in the steel industry and downstream production of HPMSM**

**Black Canyon Executive Director, Brendan Cummins, said:** “This initial sighter testwork has confirmed the leachability of manganese oxide ores from which we can crystallise a high-grade manganese sulphate product. By demonstrating the ability to produce manganese sulphate with a 32.3% Mn content, which is highly comparable to the typical 32.2% Mn content of HPMSM, represents a significant achievement for this initial phase of testwork.”

“The results establish a solid foundation for Black Canyon’s next round of more detailed manganese sulphate testwork which involves optimising the leaching and crystallisation process and will also include a critical purification phase required to remove other elemental impurities as required by the cathode active material (CAM) end users.”

“Black Canyon is rapidly developing a business case for both manganese concentrate that can be sold in the steel industry and manganese sulphate suitable for the growing electric vehicle battery market that is underpinned by a significant Mineral Resource with the potential for a multi-decade mining operation at Flanagan Bore.”

# BLACK CANYON

Australian manganese explorer, Black Canyon Limited (Black Canyon or the Company) (ASX:BCA), is pleased to announce initial manganese sulphate crystallisation testwork has delivered highly promising results, producing manganese sulphate with 32.3% Mn content which is equivalent to greater than 99% Mn purity. The success of the crystallisation continues from the leaching testwork which demonstrated up to 91% extraction from manganese oxide ores from the Flanagan Bore project (refer to ASX announcement 11 October 2022 - Successful manganese extraction from initial leaching tests).

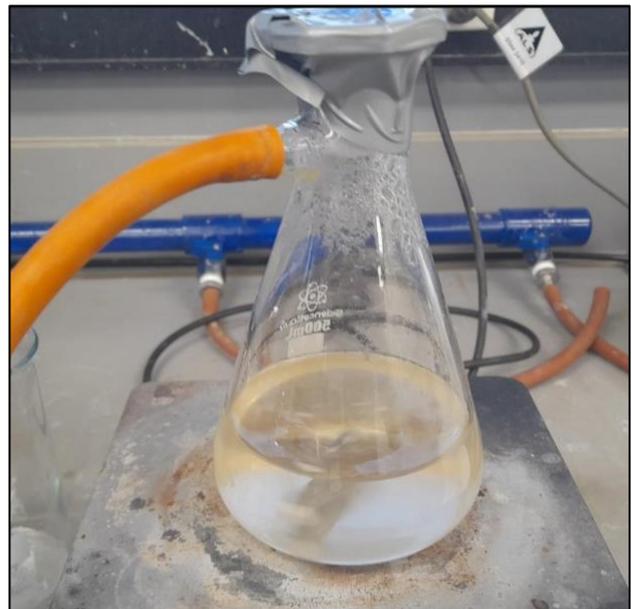

The manganese sulphate results bolsters the Company's strategy to produce HPMSM, commencing with this initial leach and crystallisation testwork which are complementary to the co-development of manganese concentrates for the alloying and steel manufacturing industry. The HPMSM strategy will now be further advanced with more detailed Scoping Level leaching, purification and crystallisation testwork to produce potential battery grade manganese sulphate over the coming months.

Flanagan Bore is part of the Company's Carawine JV and is subject to a farm-in and joint venture agreement with Carawine Resources Ltd (ASX:CWX). Having earned a 51% interest, Black Canyon is now earning up to 75% in the Carawine Project tenements by sole-funding an additional \$2.5m of exploration expenditure. The Flanagan Bore Project is located approximately 400 km southeast of Port Hedland in the east Pilbara region of Western Australia.

## Leaching and Crystallisation Testwork Objective

The objective of the initial testwork was to establish the leaching amenability of manganese oxide ores using industry standard chemical and physical parameters to determine extraction kinetics based on feedstock particle size, slurry density and SO<sub>2</sub> concentration. The manganese-rich solution was then crystallised and analysed and has demonstrated that a high-grade manganese sulphate product can be produced. The testwork has also assisted the Company's understanding of potential elemental impurities such as iron, aluminium, calcium, potassium and base metals which will be removed as part of a purification phase.

The learnings from the initial leach and crystallisation tests can now be applied to further ongoing detailed leaching, purification and crystallisation testwork to support the HPMSM Scoping Study. The Company is advancing this second stage of a hydrometallurgical testwork program with the preparation of additional manganese oxide materials from the LR1 and FB3 deposits at Flanagan Bore.

*Figure 1. Mn leachate from the initial testwork completed using manganese oxide ore*

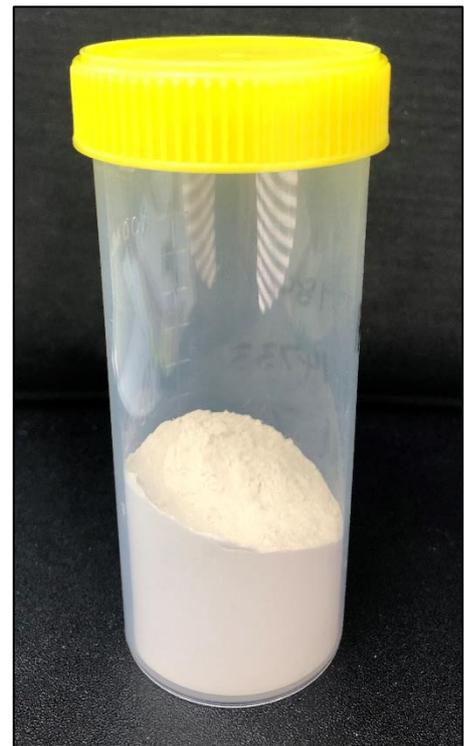

## Manganese Sulphate Crystallisation Testwork

A global manganese oxide composite was tested from across the LR1 and FB3 deposits from the Flanagan Bore Project.

The initial leach tests were undertaken on fines of manganese concentrate composites produced from previous beneficiation testwork.

A concentrated pregnant leachate solution (PLS) derived from the fore mentioned leaching testwork was neutralised, filtered and treated to remove excess calcium. The resulting manganese enriched filtrate was evaporated and the crystals recovered, dried and analysed. Chemical analysis of the recovered manganese sulphate crystals reported a Mn grade at 32.3% which is equivalent to a manganese sulphate purity of >99%.

A second stage testwork program is well advanced and will investigate additional manganese sulphate solution purification to remove other impurities and production options to support the HPMSM Scoping Study currently underway.

*Figure 2. Manganese Sulphate from Flanagan Bore containing 32.3% Mn*

## HPMSM Strategy Rationale

Whilst manganese is primarily used in the steelmaking industry, a significant growth market is emerging in the electric vehicle (EV) sector. In an increasing number of EV battery compositions, manganese is used in the cathode and makes up a significant proportion of the battery volume. The introduction of the manganese into LFP batteries, which is the fastest growing segment of the EV battery market, will likely see further demand for HPMSM.

Currently, China dominates the High Purity Manganese market, with over 90% of global production. Similar to other cathode precursor materials the requirement for security and diversification of supply will become a significant factor inducing the establishment of additional supply outside of China primarily for the American and European car manufacturing industries. The US Government has a critical mineral list that the Biden Administration identified as critical for domestic energy, electronics and defence which includes manganese. The Inflation Reduction Act recently approved by the US Government and the Free Trade Agreement between the US and Australia enables direct US investment into Australian critical mineral projects and will substantially incentivise electric vehicle and clean energy industries to establish operations in the US. This has continued to positively impact US and European investment in the development of new cathode or battery pack production capacity in parallel with joint ventures between automakers and battery manufacturers to meet growing EV demand. The potential benefit to Black Canyon is the rapid expansion of the manganese sulphate market beyond China and an interest in gaining access to physical long term physical supplies of manganese from a Tier 1 location like Australia.

In addition, HPMSM pricing is significantly higher than producing a manganese oxide concentrate product with prices up to US\$1,500 (A\$2,360) per tonne FOB considered to be achievable.

The Company believes that the pursuit of HPMSM production has the potential to materially improve the already positive economics of our project portfolio and be a key contributor to emissions reduction through the transition to EVs.

This announcement has been approved by the Board of Black Canyon Limited.

## About Black Canyon

Black Canyon has entered into a farm-in and joint venture with ASX listed Carawine Resources Limited (ASX:CWX) to acquire a majority interest in the Carawine JV Project in Western Australia. The Carawine Project covers approximately 800km<sup>2</sup> of tenure located south of the operating Woodie-Woodie manganese mine, providing a large footprint in a proven and producing manganese belt. Black Canyon has also been granted or acquired other exploration licenses adjacent to the Carawine Project that increase the total land holdings to over 2,400 km<sup>2</sup>. In addition to manganese, the Carawine Project also hosts multiple copper occurrences including the Western Star prospect which comprises a large zone of surface copper enrichment.

Manganese and copper continue to have attractive fundamentals with growing utilisation in the battery mineral sector and challenging supply conditions.

## Compliance Statements

### Reporting of Exploration Results and Previously Reported Information

The information in this report that relates to Exploration Results is based on, and fairly represents, information and supporting documentation reviewed by Mr Brendan Cummins, Executive Director of Black Canyon Limited. Mr Cummins is a member of the Australian Institute of Geoscientists, and he has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which has been undertaken to qualify as a Competent Person as defined in the 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves”. Mr Cummins consents to the inclusion in this release of the matters based on the information in the form and context in which they appear. Mr Cummins is a shareholder of Black Canyon Limited.

The information in this report that relates to metallurgical testwork results is based on information reviewed by Mr David Pass, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Pass is an employee of BatteryLimits and consultant to Black Canyon Limited. Mr Pass has sufficient experience relevant to the mineralogy and type of deposit under consideration and the typical beneficiation thereof to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (the JORC Code, 2012 Edition). Mr Pass consents to the inclusion in the report of the matters based on the reviewed information in the form and context in which it appears
