ASX Announcement

OUTSTANDING HEAVY RARE EARTH CONTENT AND THICK SCANDIUM ZONES NEAR SURFACE, OPEN IN ALL DIRECTIONS

Highlights:

- Outstanding grades up to 2,715ppm TREO, thick, near-surface Heavy Rare Earth zones 2km wide at the Yttria REE Deposit.
- Exceptional Heavy Rare Earth-rich intervals, up to 86% Heavy HREO/TREO ratio.
- Latest results define Yttria as potential important source of critical, high value Heavy Rare Earths, located only 240km north of Kalgoorlie, in a Tier 1 Mining district, and situated on Asra's 100%-owned Tarmoola Pastoral Station.
- Rare Earth Elements (REE) and Scandium mineralisation open in all directions.
- Yttria emerging as an exceptional, near-surface regolith-hosted Ionic REE¹ deposit endowed with an average of 57% Heavy REE's and extensive high levels of Scandium Oxide, in the same regolith profile.
- Outstanding high ratios of Heavy HREO underpinning high potential value of Yttria with Dysprosium and Terbium (Dy +Tb) demanding a combined value² of >US\$1,000/kg compared to ~US\$110/kg for Light Rare Earths (Pr + Nd).
- REE zones up to 25m thick, from as shallow as 1m below surface, with very low contents of radioactive elements and well below normal background levels of the continental crust.
- Yttria further complimented by Scandium-rich zones up to 46m thick, open at depth, with grades up to 187ppm Sc₂O₃. Scandium's value highlighted by Rio Tinto's recent acquisition of an Australian Scandium exploration project for \$21 million.

REE drill intercepts:

- MSC0378: **25m @ 722ppm TREO** from 1m below surface (25.4% Magnet REO)
- MSC0336: **9m @ 937ppm TREO** from 10m (**76% HREO/TREO ratio**) & 78ppm Sc₂O₃
 - Including 4m @ 1,436ppm TREO with 86% HREO/TREO ratio*
- MSC0339: 17m @ 516ppm TREO from 6m (**69% HREO/TREO**) & 73ppm Sc₂O₃
- MSC0341: 9m @ 794ppm TREO from 16m (**75% HREO/TREO**) & 77ppm Sc₂O₃
- MSC0376: 8m @ 520ppm TREO from 21m & 115ppm Sc₂O₃ (24.9% Magnet REO)

Scandium Oxide drill intercepts:

- MSC0373: **46m @ 90ppm Sc₂O₃ from 1m** (EOH mineralised at 69ppm Sc₂O₃)
 - Includes 18m @ 121ppm from 13m*
- MSC0374: **40m @ 96ppm Sc₂O₃ from 1m** (EOH mineralised at 69ppm Sc₂O₃)
 - Includes 29m @ 108ppm from 5m*
- MSC0336: **37m @ 82ppm Sc₂O₃ from surface**

¹ The terminology used in this report for the rare earth element follows the convention of the International Union of Pure and Applied Chemistry (IUPAC), whereby the LREE are defined as La, Ce, Pr, Nd and Sm, and the HREE as Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu plus Y.

² <https://www.statista.com/statistics/449838/forecast-average-rare-earth-oxide-prices-globally/>

Asra Minerals Limited (ASX: ASR) is pleased to announce further exciting Rare Earth Element (REE) results from the next batch of assays from 100 RC drill holes at the company's Yttria regolith-hosted Ionic REE² and Scandium-Oxide discovery, at its Mt Stirling Project, near Leonora, in Western Australia.

Asra's Managing Director, Rob Longley commented: "These latest results have strengthened my own understanding in the uniqueness and potential significance of Yttria; With an expected shortfall in reliable supply of the high value heavy rare earths, drilling at Yttria continues to highlight heavy rare earth enrichment and consistent elevated concentration of Terbium and Dysprosium near surface."

Furthermore, we are noticing that the zones extend under previous shallow drilling (for gold geochemistry) that did not reach the REE horizon. That leaves great upside even at Yttria, while we also expand the REE footprint with ongoing soil geochemistry across our adjacent tenements.

It's important to realise that while most REE projects in Australia have been known for many years, Yttria was only recently discovered, so we are still learning, and are very excited with the upside potential and value being revealed, as the deposit knowledge and scale grows.

Scandium's future importance has recently been brought to the forefront on investors' minds with Rio Tinto entering the Australian scandium scene, with the purchase of Platina's Deposit in NSW. At Yttria, the rare earth zones in the regolith clays are completely enveloped by a 70-100ppm Scandium Oxide profile that will be a valuable bonus when we get to an initial pit optimization stage.

Scandium is now recognised as a critical new metal for hydrogen fuel cell construction and ultra-light and strong Al-Mg-Sc alloys.

Each time we drive to our Project, we pass through Kalgoorlie and watch with great interest progress on the construction of Lynas's Processing facility on the outskirts of Town. We feel very positive that Asra is developing what will become a Rare Earth project of significance.

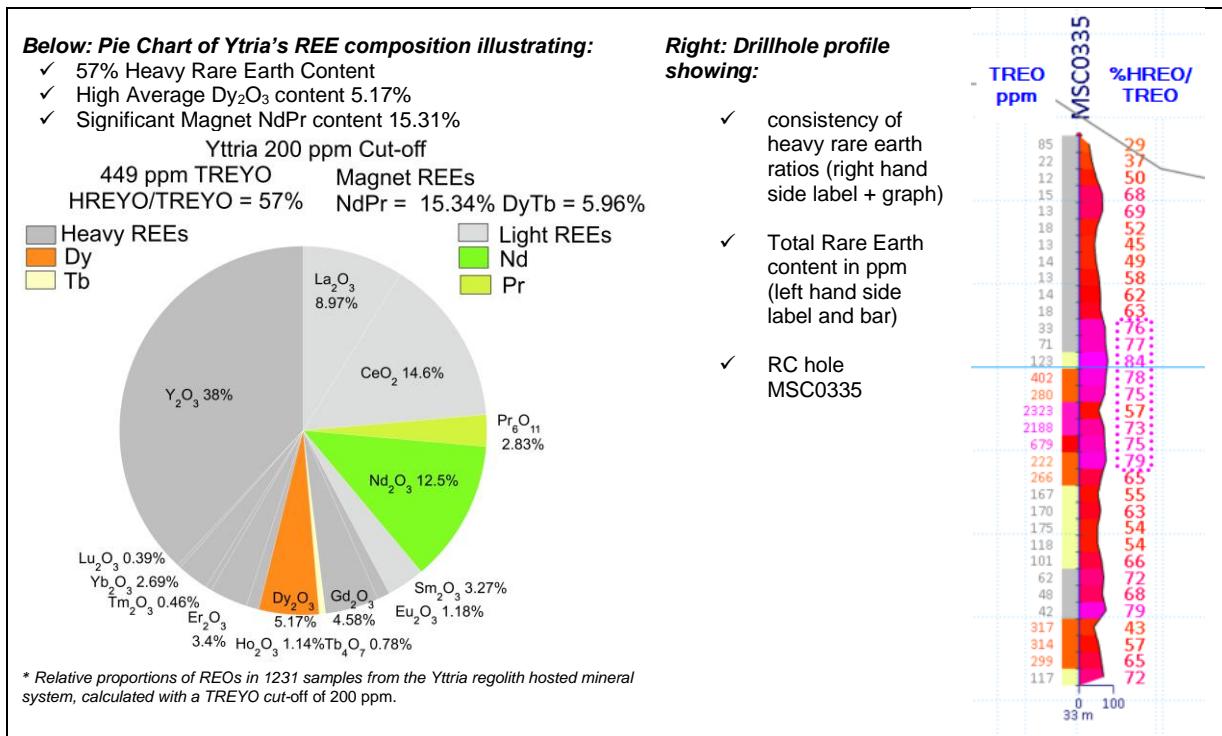

Figure 1 – REE basket content (left) and Regolith drillhole profile example (right), for the Yttria REE Deposit

¹The terminology used in this report for the rare earth element follows the convention of the International Union of Pure and Applied Chemistry (IUPAC), whereby the LREE are defined as La, Ce, Pr, Nd and Sm, and the HREE as Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu plus Y.

The Yttria REE Deposit

The cross sections below illustrate four slices through the Yttria Deposit regolith profile, with locations of the sections explained on the drillhole plan on Figure 6. Sub-Horizontal **Rare Earth zones are illustrated in red**, which sit within a broader coincident zone of enriched **Scandium Oxide, Sc₂O₃, illustrated in green** (green).

To date, drill results at Yttria are defining a ~2km wide zone of near surface clay hosted REE up to 25m thick, but remaining open to the east and west, and along strike. What is immediately apparent in section view, is the extent of exceptionally high heavy REE ratios, and consistent widths of heavy REE within the profile.

The heavy rare earths, notably Dy and Tb, have the potential to deliver significant value, as these are, by a magnitude, the most valuable and in demand oxides of the REE basket to meet forecasted permanent magnet demand for the EV, wind turbine and multiple industries working towards fully electrified and decarbonised solutions.

Some earlier vacuum drilling (MSAV holes) initially undertaken over the Yttria area to test only for gold and arsenic, have not penetrated the anticipated REE zone below. The Company has re-analysed some historical (gold) samples for REE, and many have returned high REE grades indicating **the REE mineralisation is potentially more extensive than initially considered**.

For example, vacuum hole MSAV0854 12-13m; 1680ppm TREO and 86ppm Sc₂O₃ located **550m further east** from the current defined REE zone (RC drillhole MSC0027).

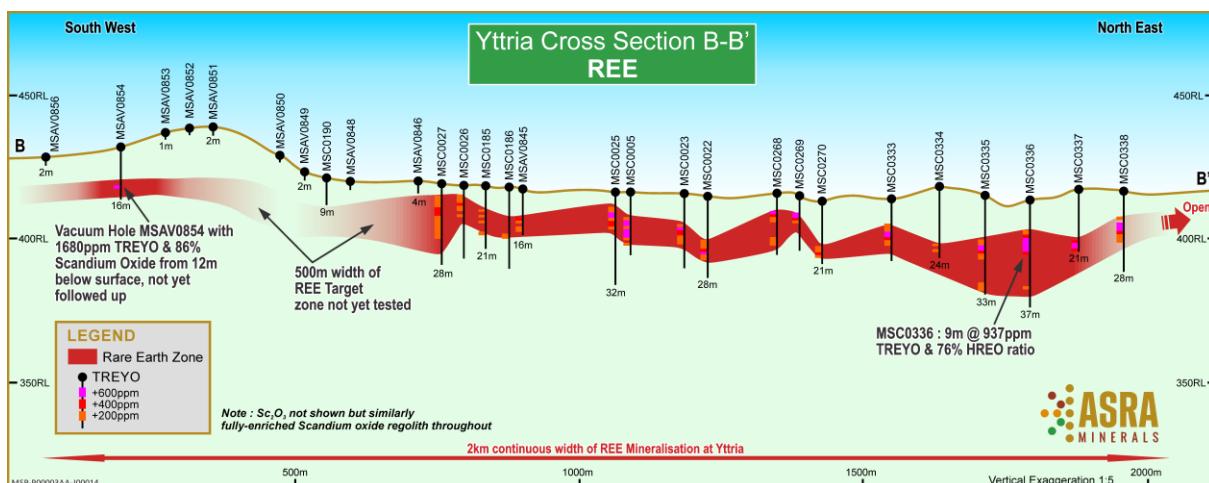

Figure 2 – Yttria Cross Section B-B'

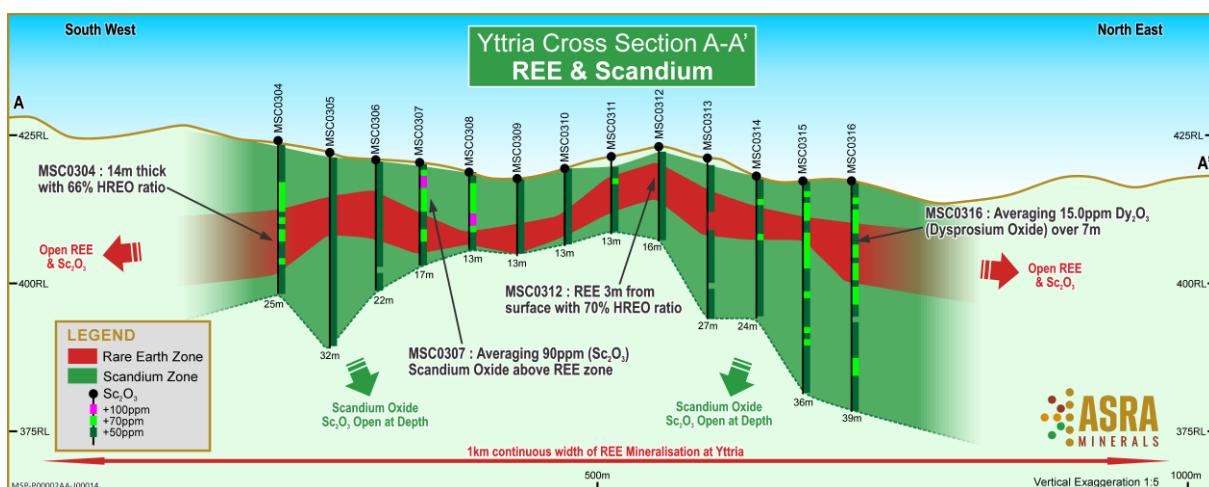

Figure 3 – Yttria Cross Section A-A'

To further emphasize ease of access to the shallow mineralisation, drillhole MSC0312 on the section above, shows the REE zone very close to surface, at a depth of only 3m. Section (A-A') above also illustrates the extensive Scandium Oxide (Sc_2O_3) mineralisation enveloping the REE zones.

Sc_2O_3 grades remain highly mineralised at the bottom of all the RC drillholes at Yttria and this is explained in more detail in Professor Ken Collerson's technical section, at the back of this report.

Two more sections shown below at Yttria are good examples of the orebody knowledge and technical data Asra have collected to date. This information will be put to great use as the Company moves forward with geological domain and resource definition, initial Metallurgy testwork, and expansion of the REE footprint size across its entire Mt Stirling Project at Leonora.

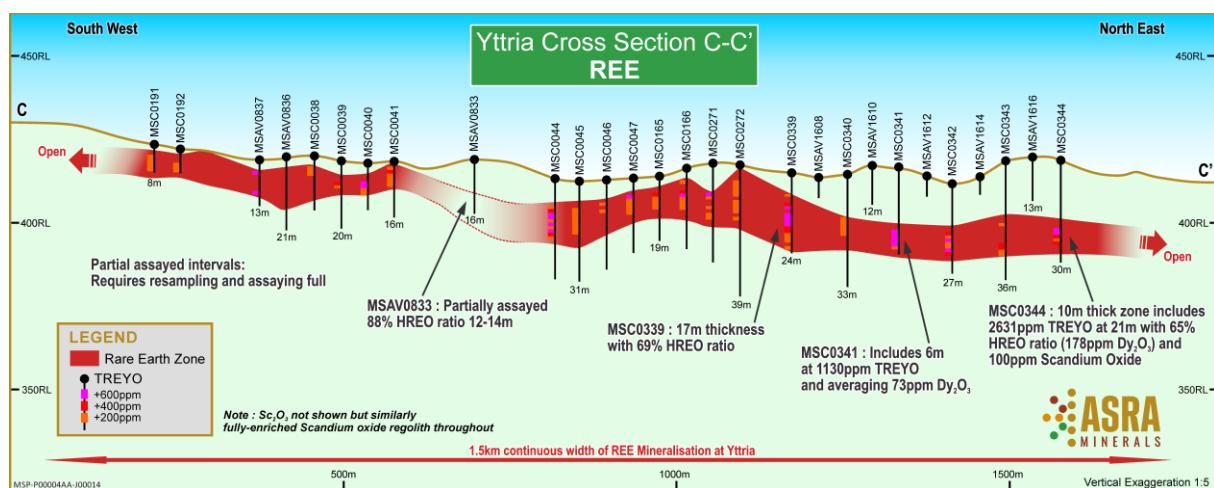

Figure 4 – Yttria Cross Section C-C'

As shown below, large areas remain untested for REE, and knowledge now gained from the RC drilling campaign will be used to target extensions and provide significant upside Resource potential.

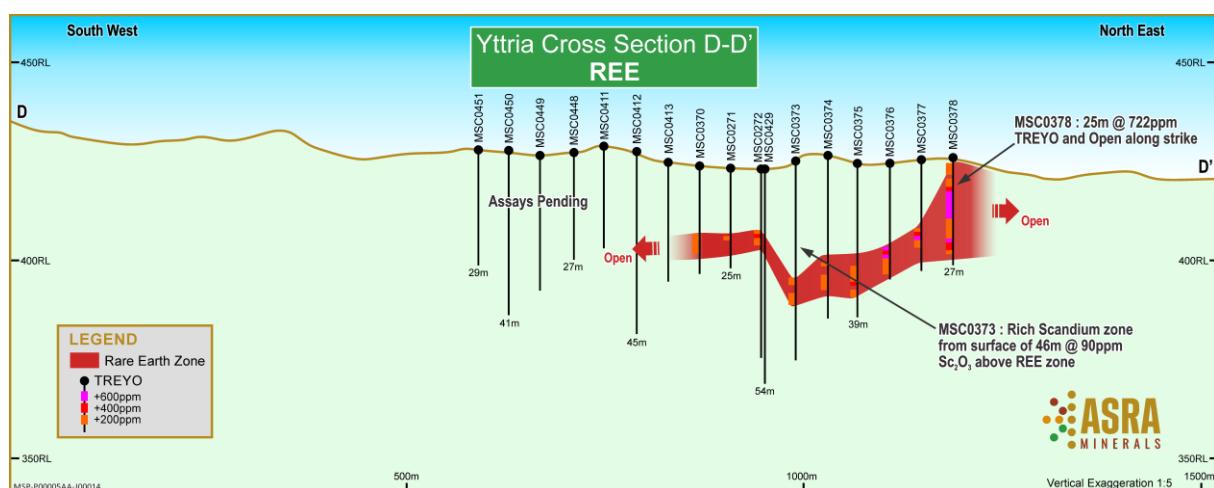

Figure 5 – Yttria Cross Section D-D'

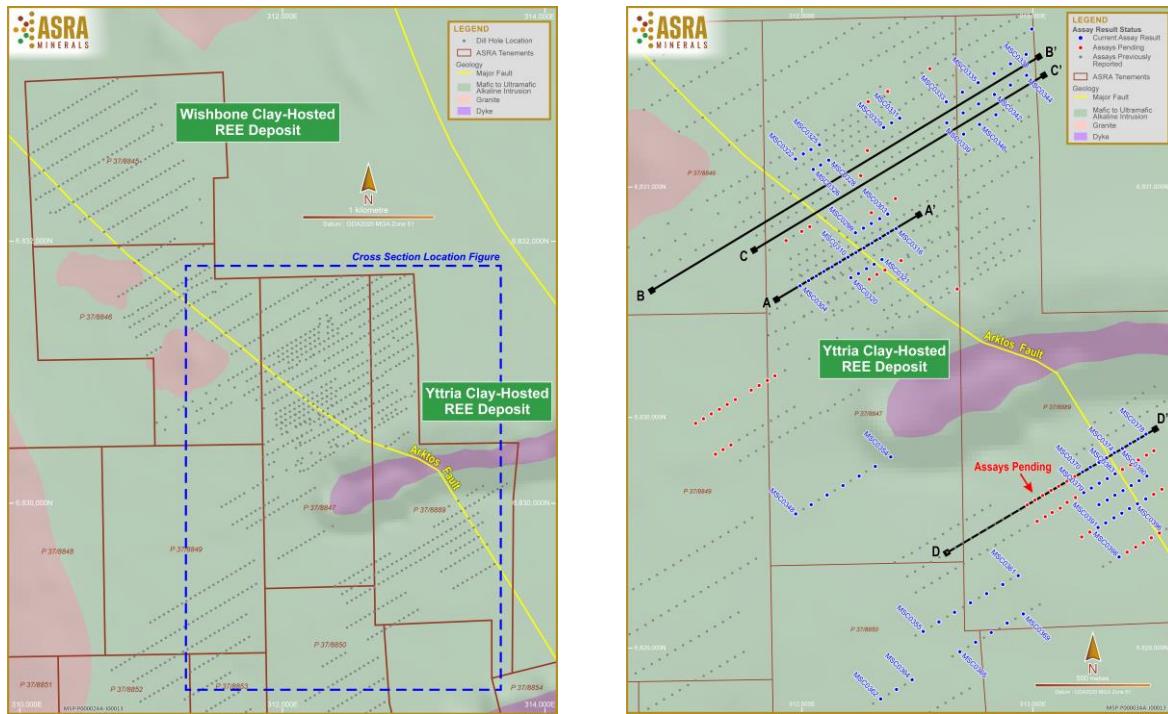

Figure 6 – Yttria and Wishbone REE Area – Drillhole layout Plan showing cross section locations

Asra's next steps:

1. Assays from a further 74 drillholes at Yttria are still outstanding and will be progressively reported in the coming weeks (MSC0399-451 and 21 additional re-sampled RC holes).
2. Exploration field teams are currently at Yttria undertaking step-out soil geochemistry surveys using handheld XRF spectrometers that are calibrated for REE.
3. Field staff have completed a QAQC sampling programme at Yttria.
4. Exploration staff are currently collecting additional samples from different defined geological domains defined by these new drill assay results, to add to the Metallurgical bulk sample.
5. Drilling to date has tested 3.5km of the REE footprint and Asra plans to test strike continuity of REE and Scandium oxide across the full +20km strike potential at Mt Stirling within its current tenement holding.
6. The technical database phase is nearing completion and attention has shifted to prioritise REE Ore Body Knowledge and Metallurgical characteristics:

Planned Next Steps

A

DATA – NEARING COMPLETION

- Complete rigorous technical database system
- Receive pending assays (74 RC holes)
- Geochem and ground geophysics to map footprint
- Ongoing Exploration programmes.

B

REE RESOURCE EVALUATION – UNDERWAY

- QAQC and Field validation
- Orebody knowledge, define GeoMet domains
- Add to existing Met sample
- Potential Exploration Target size evaluation.

C

MET TESTING – BUILDING ON 350KG SAMPLE

- Particle size analysis – define target size fraction
- Met Test across various defined GeoMet domains
- Further Bulk sampling

Figure 7 - Planned Next Steps for Yttria REE Evaluation

Prof Ken Collerson's Technical Commentary:

Asra's REE Technical Consultant, **Professor Ken Collerson** commented:

"Perhaps the most important factor for investors to understand with various methods of REE reporting, is that the value of a REE deposit, and hence its potential basket price valuation, is highly dependent on the proportions of individual REE elements and their possible ease of extraction."

As rule of thumb high heavy rare earth content systems can be significantly more economic at lower cut-off grades. Yttria is exceptional in this regard with an average HREYO/TREYO ratio of ~57% at 450ppm (>200 ppm Cut-off). This is because of high value of DyTb oxide ~US\$1000/kg.

In addition, to assist industry reporting consistency and the investors' ability to understand Rare Earth projects, I strongly recommend all Companies adopt the REE convention recommended by International Union of Pure and Applied Chemistry (IUPAC).

Thankfully, Asra has adopted this convention, and as can be seen in this announcement, REE assays are reported in order of increasing atomic number from La ($n=57$) to Lu ($n= 71$) and not listed alphabetically. Using this convention, the LREE are defined as La, Ce, Pr, Nd and Sm, and the HREE as Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu plus Y".

The Regolith: With the Yttria Deposit, which is hosted within the regolith profile, it is critical to evaluate the geochemistry through the profile. Depth profiles through the regolith for TREYO, HREYO/TREYO ratio and Sc_2O_3 are shown in Figure 8 and Figure 9. Notably, these are identical to profiles through Ionic Clay Deposits in China, Madagascar, Brazil and Thailand.

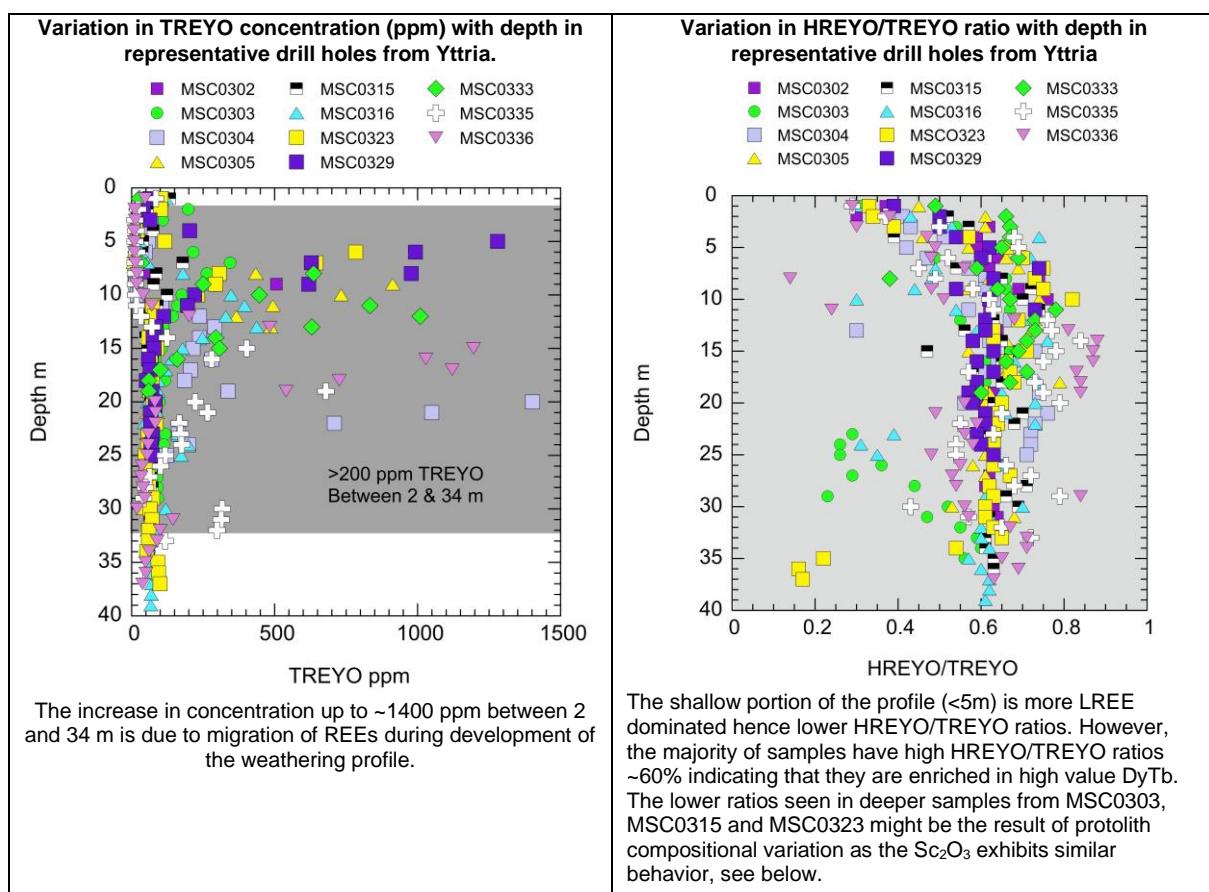

Figure 8 - Depth vs TREO grade Evaluation for Yttria

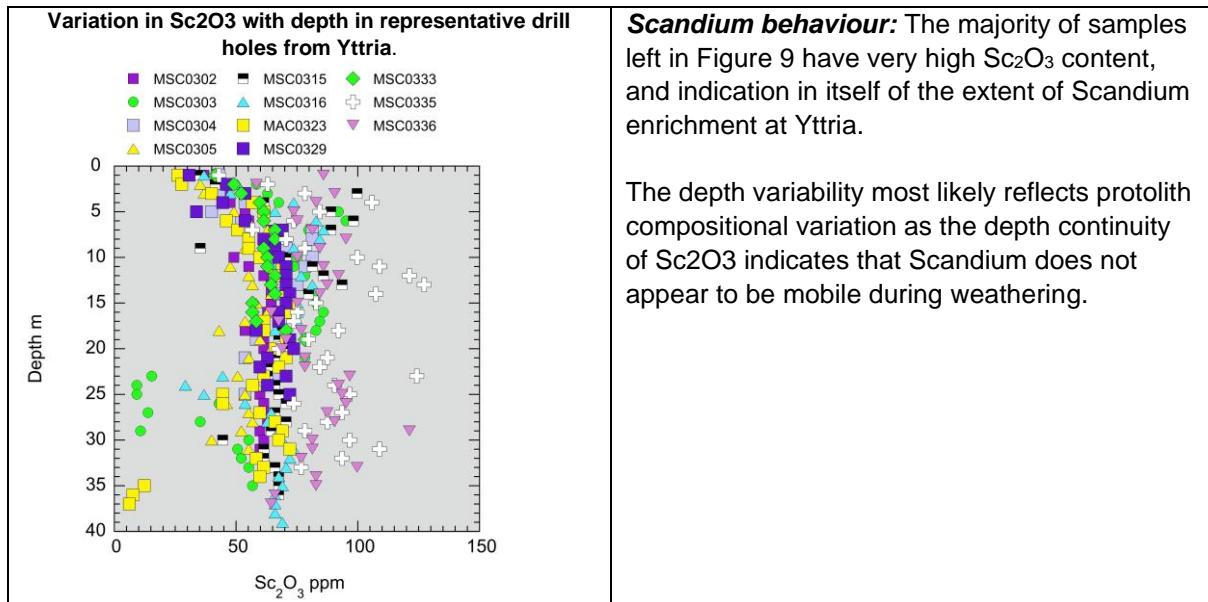

Figure 9 - Variation in Sc_2O_3 with depth at Yttria

Cerium Ratios: Exploration for ionic clay hosted REE deposits requires an understanding of the behaviour of REEs during weathering (oxidation). In weathered crustal profiles, Cerium (Ce) is mobile and there is a tendency for the uppermost weathering zone to develop an excess in Ce (expressed as a positive Ce anomaly; expressed as $\text{Ce}/\text{Ce}^*>1$). However, deeper zones generally show a Ce deficit (i.e., negative anomalies expressed as $\text{Ce}/\text{Ce}^*<1$), particularly in heavily weathered profiles.

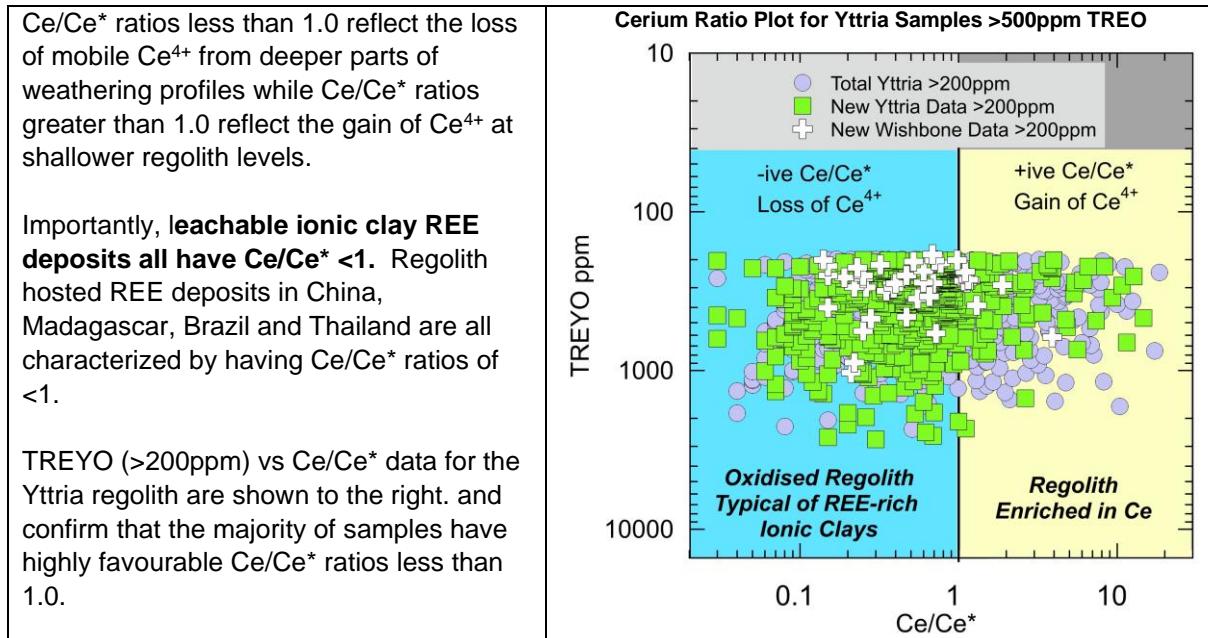

Figure 10 - Proportions of the different REE oxides in Yttria regolith sample with >500 ppm TREO and $\text{Ce}/\text{Ce}^*<1$.

Indication of an Alkaline Plume system at Mt Stirling: The ratio of niobium to tantalum (Nb/Ta) is a particularly robust vector for plume magmatism, the primary geological control on alkaline magmatism. Alkaline magmas are among the most important the engine rooms for critical metal transport and enrichment. Thus, the Sc and REE enrichment at Yttria and Wishbone reflects the presence of an underlying and poorly known alkaline ultramafic- to mafic. Intrusion.

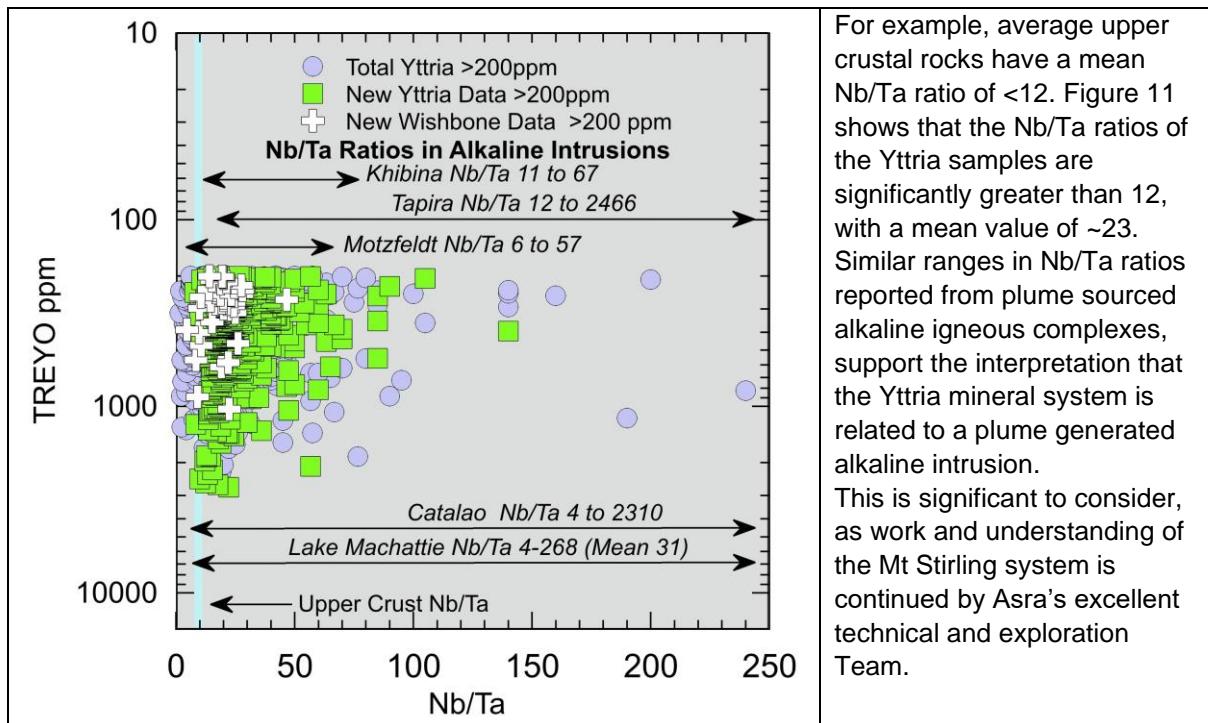

Figure 11 - TREYO values for RC assays plotted against Nb/Ta.

About Asra:

Asra Minerals is developing Gold and REE projects, located in the prime Eastern Goldfields jurisdiction of Leonora, Western Australia.

The company's Mt Stirling Project hosts 10 advanced gold prospects as well as a unique inventory of clean, heavy-dominant (Dysprosium, Terbium) Rare Earth Elements (REE) and critical minerals (Scandium and Cobalt).

Located near the mining town of Leonora, 240km north of Kalgoorlie in Western Australia, the Mt Stirling Project has:

- ✓ **Gold** - a current JORC compliant Mineral Resource of gold alongside Red 5's (ASX: RED) King of the Hills mine. The region has recently produced approximately 14Moz of gold from mines such as Tower Hills, Sons of Gwalia, Thunderbox, Harbour Lights and Gwalia. Mt Stirling is nearby to excellent infrastructure including road, rail and mills.
- ✓ **REE** - A high ratio of heavy rare earths to total rare earths (0.62 to 1) and a lack of radioactivity distinguishes the company's Yttria and Wishbone prospects which contain a high proportion of the magnet REEs dysprosium, terbium, praseodymium and neodymium, as well as significant anomalous concentrations of cobalt and scandium.
- ✓ **Property**: The Company owns the 172,662-hectare Tarmoola Pastoral Station underlying the Company's gold and REE deposits and infrastructure. The Station also extends north and east to cover Red 5's KOTH Gold Operation (ASX: RED) and Aeris' Jaguar Mining Centre (ASX: AIS).
- ✓ **Equity** :Asra also has free-carried gold joint ventures in the WA Goldfields with Zuleika (ASX: ZAG) and Loyal Lithium (ASX: LLI) as well as a large equity holding in LLI.

Figure 12- Asra's Mt Stirling Project location in the north-eastern Goldfields of Western Australia.

Competent Person Statement

Statements contained in this report relating to Rare Earth and Scandium exploration results, scientific evaluation, and potential, are based on information compiled and evaluated by Professor Ken Collerson. Professor Collerson (PhD) Principal of KDC Geo Consulting, and a Fellow of the Australasian Institute of Mining and Metallurgy (AusIMM #100125), is a geochemist/geologist with sufficient relevant experience in relation to rare earth element geochemistry, critical metal mineralisation and REE systematics to qualify as a Competent Person as defined in the Australian Code for Reporting of Identified Mineral resources and Ore reserves (JORC Code 2012). Professor Collerson consents to the use of this information in this report in the form and context in which it appears.

Where the Company refers to Mineral Resources in this, it confirms that it is not aware of any new information or data that materially affects the information included in that announcement and all material assumptions and technical parameters underpinning the Mineral Resource estimate with that announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Persons findings are presented have not materially changed from the original announcement.

Cautionary Note Regarding Forward-Looking Statements

This news release contains "forward-looking information" within the meaning of applicable securities laws. Generally, any statements that are not historical facts may contain forward-looking information, and forward looking information can be identified by the use of forward-looking terminology such as "plans", "expects" or "does not expect", "is expected", "budget" "scheduled", "estimates", "forecasts", "intends", "anticipates" or "does not anticipate", or "believes", or variations of such words and phrases or indicates that certain actions, events or results "may", "could", "would", "might" or "will be" taken, "occur" or "be achieved." Forward-looking information is based on certain factors and assumptions management believes to be reasonable at the time such statements are made, including but not limited to, continued exploration activities, Gold and other metal prices, the estimation of initial and sustaining capital requirements, the estimation of labour costs, the estimation of mineral reserves and resources, assumptions with respect to currency fluctuations, the timing and amount of future exploration and development expenditures, receipt of required regulatory approvals, the availability of necessary financing for the Project, permitting and such other assumptions and factors as set out herein. apparent inconsistencies in the figures shown in the MRE are due to rounding.

Forward-looking information is subject to known and unknown risks, uncertainties and other factors that may cause the actual results, level of activity, performance or achievements of the Company to be materially different from those expressed or implied by such forward-looking information, including but not limited to: risks related to changes in Gold prices; sources and cost of power and water for the Project; the estimation of initial capital requirements; the lack of historical operations; the estimation of labour costs; general global markets and economic conditions; risks associated with exploration of mineral deposits; the estimation of initial targeted mineral resource tonnage and grade for the Project; risks associated with uninsurable risks arising during the course of exploration; risks associated with currency fluctuations; environmental risks; competition faced in securing experienced personnel; access to adequate infrastructure to support exploration activities; risks associated with changes in the mining regulatory regime governing the Company and the Project; completion of the environmental assessment process; risks related to regulatory and permitting delays; risks related to potential conflicts of interest; the reliance on key personnel; financing, capitalisation and liquidity risks including the risk that the financing necessary to fund continued exploration and development activities at the Project may not be available on satisfactory terms, or at all; the risk of potential dilution through the issuance of additional common shares of the Company; the risk of litigation.

Although the Company has attempted to identify important factors that cause results not to be as anticipated, estimated or intended, there can be no assurance that such forward-looking information will prove to be accurate, as actual results and future events could differ materially from those anticipated in such information. Accordingly, readers should not place undue reliance on forward-looking information. Forward looking information is made as of the date of this announcement and the Company does not undertake to update or revise any forward-looking information this is included herein, except in accordance with applicable securities laws.

Appendix 2: Drillhole Assays for Mineralised Zones >~200ppm TREYO and elevated Scandium Oxide

The terminology used in this report for the rare earth element follows the convention of the International Union of Pure and Applied Chemistry (IUPAC), whereby the LREE are defined as La, Ce, Pr, Nd and Sm, and the HREE as Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu plus Y.

JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> 	<ul style="list-style-type: none"> Assay results reported in this document at Asra's Yttria REE and Scandium Deposit are from Reverse Circulation drilling (RC). Reverse circulation drilling (for Au) was used to obtain 1m samples for laboratory analysis. Samples were dispatched to LabWest in Perth for analysis by their MMA-04 methodology: LabWest's sample preparation regime (Code PREP-01) has been devised to ensure conformity with accepted statistical sampling approaches. After reception and sorting, RC drill samples are dried at 110°C. Samples greater than ~700g are fine-crushed to less than 2mm, before being rotary-split to ~500g. A coarse duplicate is taken from every 40th sample for analysis. Samples are then pulverised to minus 75µm. Pulveriser bowls are routinely cleaned with a barren charge between samples. Soil, Aircore, RAB, samples <3kg. Sort, dry, split, pulverize to -75µm.
<i>Drilling techniques</i>	<ul style="list-style-type: none"> <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i> 	<ul style="list-style-type: none"> RC drilling was carried out utilising a face sampling bit with holes generally 155mm in diameter.
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i> 	<ul style="list-style-type: none"> Drill chips were taken by sieving each 1m sample and any zones of poor recovery were noted in both driller's logs or geologist notes. Drilling was paused at 1m sampling intervals to reduce any smearing of results and sampling equipment routinely cleaned to avoid any contamination.
<i>Logging</i>	<ul style="list-style-type: none"> <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> 	<ul style="list-style-type: none"> Sieved RC chips were collected for each 1m interval and logged and photographed for later interpretation and reference. All geological logging is qualitative in nature. No geotechnical logging was conducted.

Criteria	JORC Code explanation	Commentary
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> • <i>The total length and percentage of the relevant intersections logged.</i> • <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> • <i>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</i> • <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> • <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> • <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i> • <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> 	<ul style="list-style-type: none"> • No drill core undertaken. • Resultant RC sample size of 3-5kg considered appropriate for 1m samples. • Wherever possible, RC samples were taken dry via a rotary onboard splitter. • QA/QC data of the Asra drilling includes insertion and subsequent checks of periodical standards. • Certified Reference Materials (CRM's) are included and analyzed in each batch of sample.
<i>Quality of assay data and laboratory tests</i>	<ul style="list-style-type: none"> • <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> • <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> • <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i> 	<ul style="list-style-type: none"> • LabWest laboratories inserted check samples for each batch of samples analysed and reports these accordingly with all results. • The laboratory QAQC has been assessed in respect of the RC chip sample assays and it has been determined that the levels of accuracy and precision relating to the samples are acceptable. • Rare Earth element (and multi element) analysis have been obtained utilising LabWest's MMA-04 technique. This involves coupling of microwave assisted, HF based digestion with Induced Coupled Plasma-Mass Spectrometry (ICP-MS) determination.
<i>Verification of sampling and assaying</i>	<ul style="list-style-type: none"> • <i>The verification of significant intersections by either independent or alternative company personnel.</i> • <i>The use of twinned holes.</i> • <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> • <i>Discuss any adjustment to assay data.</i> 	<ul style="list-style-type: none"> • Drill intercepts have been tabulated in this report using a 200ppm TREYO cut-off, with up to 2m of material which may be just under the 200ppm cutoff, yet still mineralised with either REE and/or Scandium Oxide. • Intercepts were cross checked by Asra's REE Consultant and Competent Person, Professor Ken Collerson. • Several RC holes of this reported drill program were designed to be close to previously drilled Vacuum drillholes at Yttria to check variability. • Original LabWest assay files were supplied to Asra's database manager, MaxGeo, and merged in their DataShed software with

Criteria	JORC Code explanation	Commentary
		<p>matching sample numbers and hole-from-to data supplied by Asra.</p> <ul style="list-style-type: none"> Terminology used in this report for the rare earth element follows the convention of the International Union of Pure and Applied Chemistry (IUPAC), whereby the LREE are defined as La, Ce, Pr, Nd and Sm, and the HREE as Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu plus Y. Elemental analysis was recalculated to Oxide values for the purpose of standard reporting of REE's.
<i>Location of data points</i>	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> Drill hole collars were located using a handheld GPS system referenced to MGA Zone 51 Datum GDA 94. Accuracy of the handled GPS devices is within +/-5m. Collar elevations were further enhanced by pressing an SRTM topographic digital terrain surface (Shuttle Radar Topographic Mission) data onto the drillhole plan and assigning a more representative topographic level value. Drillholes will be surveyed more accurately using the 'ANT' differential GPS system supplied by the Precision Mining and Drilling company and will be sub centimeter accuracy,
<i>Data spacing and distribution</i>	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	<ul style="list-style-type: none"> Drill spacing is based on a 80m x 40m grid pattern with some infill to 40m x 40m. Samples were not composited.
<i>Orientation of data in relation to geological structure</i>	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> The drill grid is orientated 330 degrees to align with the general geological strike. The Regolith hosted REE mineralisation is more vertically variable, and not necessarily aligned with regional geological strike.
<i>Sample security</i>	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> Drill samples were collected at the drill site in calico bags at Ytria, Mt Stirling, by Asra personnel. Samples were transported from site to LabWest laboratory in Perth by Asra employees/contractors.

Criteria	JORC Code explanation	Commentary
<i>Audits or reviews</i>	<ul style="list-style-type: none"> <i>The results of any audits or reviews of sampling techniques and data.</i> 	<ul style="list-style-type: none"> A sample submission form containing laboratory instructions was submitted to the laboratory. A thorough review of sampling techniques has been performed internally by Asra but an independent audit is yet to be implemented. The entire historical drillhole database at Mt Stirling has recently been reconstructed using Max Geo's DataShed database system. This has involved significant due diligence, ground truthing and verification of sample quality for ongoing work. Further QA/QC work is ongoing with a campaign of additional field duplicate sampling underway at Yttria.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<ul style="list-style-type: none"> <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate.</i> 	<ul style="list-style-type: none"> Drilling was carried on valid Western Australian Prospecting Licenses 100% owned by Asra Minerals and are in good standing. PL's 37/8845, /8846, /8847, and /8899.
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> <i>Acknowledgment and appraisal of exploration by other parties.</i> 	<ul style="list-style-type: none"> In 2022, Asra completed various vacuum auger drilling (AV) and RC drilling campaigns across parts of the Mt Stirling area. To date, 1317 AV holes for 16,516m has been completed. No other historical drilling work has been done on the licenses.
<i>Geology</i>	<ul style="list-style-type: none"> <i>Deposit type, geological setting and style of mineralisation.</i> 	<ul style="list-style-type: none"> Tenements are located within the Leonora District of the Kalgoorlie terrane, approximately 30 km northwest of Leonora in Western Australia. <ul style="list-style-type: none"> Geologically, the project sits within the Archean Norseman-Wiluna Greenstone Belt. The area is moderately well exposed and contains many minor gold occurrences and old workings along with several significant

Criteria	JORC Code explanation	Commentary
		<p>economic gold discoveries in the surrounding Leonora District, including the King of the Hills, Sons of Gwalia, Tower Hill and Harbour Lights deposits.</p> <ul style="list-style-type: none"> The Mt Stirling project areas are within the older (pre-2817 Ma) Leonora stratigraphy which consists of tholeiitic and komatiitic basalts, with minor interbedded sedimentary units. The rocks are affected by amphibolite to upper greenschist metamorphism, with metamorphic grade increasing toward the contact with the Raeside Batholith. The Leonora Inlier is divided by a number of large shear zones including the Ursus and Tarmoola Shear Zones within the main northwest-trending greenstone package, and the Gwalia (Poker) Shear Zone on the eastern margin of the Raeside Batholith. The Rare Earth mineralisation at Yttria is associated within clays within the Regolith profile. The origin of the rare earths are still not fully understood and is subjects to ongoing investigation and research by Asra. The discovery also represents a homogenous and large presence of significantly elevated Scandium Oxide (Sc_2O_3) throughout the entire regolith. Potential economic levels of Scandium are pervasive throughout the entire regolith profile at Yttria. Interpretation of specific chemical ratios within the Yttria regolith assays suggest that the mafic/ultramafic intrusion below Yttria is a comparatively rare plume-generated alkaline intrusion.
<i>Drill hole Information</i>	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<ul style="list-style-type: none"> A full table of drillhole collar details and significant drill intercepts is included in this report. Not required.
<i>Data aggregation methods</i>	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. 	<ul style="list-style-type: none"> Elemental assay values received by LabWest were recalculated to REE industry standard oxide equivalents using the following arithmetic formulas:

Criteria	JORC Code explanation	Commentary																																																
	<ul style="list-style-type: none"> Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<p>• Ratios of Total/Heavy/Light/Magnet REE have been reported according to IUPAC standards as tabled below:</p> <table border="1" data-bbox="1224 285 2077 341"> <tr> <td>La</td><td>Ce</td><td>Pr</td><td>Nd</td><td>Sm</td><td>Eu</td><td>Gd</td><td>Tb</td><td>Dy</td><td>Ho</td><td>Er</td><td>Tm</td><td>Yb</td><td>Lu</td><td>Y</td><td>Sc</td> </tr> <tr> <td>1.1727729</td><td>1.2284000</td><td>1.2081628</td><td>1.1663831</td><td>1.1595682</td><td>1.1434844</td><td>1.1526175</td><td>1.1761800</td><td>1.1476866</td><td>1.1455000</td><td>1.1435000</td><td>1.1421000</td><td>1.1387000</td><td>1.1371000</td><td>1.2699000</td><td>1.5338364</td> </tr> <tr> <td>La₂O₃</td><td>CeO₂</td><td>Pr₆O₁₁</td><td>Nd₂O₃</td><td>Sm₂O₃</td><td>Eu₂O₃</td><td>Gd₂O₃</td><td>Tb₄O₇</td><td>Dy₂O₃</td><td>Ho₂O₃</td><td>Er₂O₃</td><td>Tm₂O₃</td><td>Yb₂O₃</td><td>Lu₂O₃</td><td>Y₂O₃</td><td>Sc₂O₃</td> </tr> </table>	La	Ce	Pr	Nd	Sm	Eu	Gd	Tb	Dy	Ho	Er	Tm	Yb	Lu	Y	Sc	1.1727729	1.2284000	1.2081628	1.1663831	1.1595682	1.1434844	1.1526175	1.1761800	1.1476866	1.1455000	1.1435000	1.1421000	1.1387000	1.1371000	1.2699000	1.5338364	La ₂ O ₃	CeO ₂	Pr ₆ O ₁₁	Nd ₂ O ₃	Sm ₂ O ₃	Eu ₂ O ₃	Gd ₂ O ₃	Tb ₄ O ₇	Dy ₂ O ₃	Ho ₂ O ₃	Er ₂ O ₃	Tm ₂ O ₃	Yb ₂ O ₃	Lu ₂ O ₃	Y ₂ O ₃	Sc ₂ O ₃
La	Ce	Pr	Nd	Sm	Eu	Gd	Tb	Dy	Ho	Er	Tm	Yb	Lu	Y	Sc																																			
1.1727729	1.2284000	1.2081628	1.1663831	1.1595682	1.1434844	1.1526175	1.1761800	1.1476866	1.1455000	1.1435000	1.1421000	1.1387000	1.1371000	1.2699000	1.5338364																																			
La ₂ O ₃	CeO ₂	Pr ₆ O ₁₁	Nd ₂ O ₃	Sm ₂ O ₃	Eu ₂ O ₃	Gd ₂ O ₃	Tb ₄ O ₇	Dy ₂ O ₃	Ho ₂ O ₃	Er ₂ O ₃	Tm ₂ O ₃	Yb ₂ O ₃	Lu ₂ O ₃	Y ₂ O ₃	Sc ₂ O ₃																																			
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known'). 	<ul style="list-style-type: none"> Mineralisation trends of REE are sub-horizontal. As drilling was vertical, reported drill intercepts are interpreted to be very close to true widths. Scandium oxide mineralisation appears to be very pervasive from near surface and orientations not yet fully understood However, high grade Sc₂O₃ zones also appear to be sub horizontal so reported drill intercepts are also currently interpreted to be close to true widths. 																																																
Diagrams	<ul style="list-style-type: none"> Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<ul style="list-style-type: none"> Plan and cross-section figures are included in this report. 																																																
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> Significant REE assays above 200ppm TREYO have been tabulated in this report however it is not practical to report all assays due to the volume of data. Asra believes the selection of assay reporting is appropriate and in no way misleading. 																																																
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> REE and Scandium was first recognized as being highly anomalous at Mt Stirring by Asra in 2022. To date, pXRF, vacuum and RC drilling has been conducted but no diamond drilling has yet been undertaken to ascertain density and structures. A bulk sample is being collected from Asra's drill samples for metallurgical testwork. 																																																
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). 	<ul style="list-style-type: none"> Step-out pXRF geochemical surveys to detect along strike extensions of REE and Scandium mineralisation is underway. 																																																

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	<ul style="list-style-type: none"> Geological analysis and interpretation from RC drill chip logging and assay chemistry is also in progress. Further drilling is planned to define REE and Scandium extents. Several diamond holes are in planning to assist rock, mineralisation, mineralogical, metallurgical and density characterization. Metallurgical testwork is being planned once material characteristics of the regolith and REE dispersion are better understood.
