

ASX RELEASE | 10 May 2023

Discovery of new lithium bearing pegmatite dyke swarm at Adina

HIGHLIGHTS

- Drilling has identified a new lithium-bearing pegmatite dyke swarm at Adina, located in the footwall of the deposit below previous drilling.
- First results have been received as detailed in Table 1:
 - 2.44% Li₂O over 10.1m from 219.9m and 1.10% Li₂O over 21.0m from 260.6m (AD-23-051),
 - 1.57% Li₂O over 15.4m from 221.5m (AD-23-073),
 - 1.29% Li₂O over 14.0m from 200.8m (AD-23-054), and
 - 1.02% Li₂O over 23.2m from 253.0m (AD-23-028).
- The discovery of a new zone of lithium mineralisation significantly changes the potential endowment at Adina and is anticipated to enhance the potential to develop a viable lithium operation.
- Strong high-grade lithium intersections continue from the Main Zone of lithium mineralisation at Adina, with new results presented in this release including:
 - 2.25% Li₂O over 18.7m from 43.3m (AD-23-072),
 - 2.09% Li₂O over 10.0m from 35.2m (AD-23-028),
 - 1.71% Li₂O over 42.8m from 49.9m (AD-23-040),
 - 1.68% Li₂O over 34.0m from 126.0m (AD-23-060),
 - 1.38% Li₂O over 44.1m from 49.9m (AD-23-073); and
 - 1.34% Li₂O over 32.6m from 65.5m (AD-23-057).
- A fourth drill rig is being mobilised to Adina for resource definition drilling.
- Continued flow of results ensures Winsome on track for maiden Adina Mineral Resource Estimate later in 2023.

Lithium exploration and development company Winsome Resources (ASX:WR1; “Winsome” or “the Company”) is pleased to provide an update on exploration at its 100% owned projects in the James Bay region of Quebec, Canada. Intersections have confirmed the discovery of a new lithium-bearing pegmatite dyke swarm at Adina as summarised in Table 1. In addition, further results have been received from recent drilling at the Adina Main Zone, as summarised in Table 2, as well as from drilling at the Cancet Project.

WINSOME’S MANAGING DIRECTOR CHRIS EVANS SAID:

“The discovery of a new zone of mineralisation at Adina adds further evidence to our belief that this is a globally significant lithium project. This new zone is anticipated to contribute to our main resource estimate, due later in 2023, as well as enhancing the viability of the project, and further drilling is now underway to define its up-dip extent, closer to surface. Once again this is due to the good work of our dedicated team on the ground, and I am pleased to be in Canada again being part of the intensive drilling campaign that continues at Adina.”

Hole	Intercepts	Setting
AD-23-028	1.02% Li ₂ O over 23.2m from 253.0m to 276.2m	West
AD-23-038A	1.00% Li ₂ O over 8.0m from 306.4m to 314.4 incl. 1.47% Li ₂ O over 4.8m from 318.8m to 323.6m	Central
AD-23-051	2.44% Li ₂ O over 10.1m from 219.9m to 230.0m 1.10% Li ₂ O over 21.0m from 260.6m to 281.6m	Central
AD-23-054	1.29% Li ₂ O over 14.0m from 200.8m to 214.8m	East
AD-23-072	1.46% Li ₂ O over 4.0m from 236.1m to 240.1m	East
AD-23-073	1.57% Li ₂ O over 15.4m from 221.5m to 236.9m	East

Table 1. Key mineralised intercepts, Adina Footwall Zone

Hole	Intercepts	Setting
AD-23-028	2.09% Li ₂ O over 10.0m from 35.2m to 45.2m	Up-dip of previous drilling
AD-23-038A	1.17% Li ₂ O over 10.0m from 152.0m to 162.0m	Central area of Main Zone
AD-23-040	1.71% Li ₂ O over 42.8m from 49.9m to 92.7m	Up-dip of previous drilling
AD-23-051	1.29% Li ₂ O over 15.2m from 15.9m to 31.1m 1.50% Li ₂ O over 5.0m from 70.5m to 75.5m	Central area of Main Zone
AD-23-053	0.83% Li ₂ O over 41.7m from 73.5m to 115.2m incl. 1.16% Li ₂ O over 18.6m from 80.6m to 99.2m	Eastern area of Main Zone
AD-23-057	1.34% Li ₂ O over 32.6m from 65.5m to 99.1m incl. 2.27% Li ₂ O over 11.7m from 66.5m to 78.2m	Eastern area of Main Zone
AD-23-060	1.68% Li ₂ O over 34.0m from 126.0m to 160.0m incl. 2.42% Li ₂ O over 18.8m from 139.2m to 158.0m	Eastern area of Main Zone
AD-23-071	1.41% Li ₂ O over 16.0m from 59.0m to 75.0m	Eastern area of Main Zone
AD-23-072	2.25% Li ₂ O over 18.7m from 43.3m to 62.0m	Eastern area of Main Zone
AD-23-073	1.38% Li ₂ O over 44.1m from 49.9m to 94.0m incl. 2.36% Li ₂ O over 11.4m from 49.9m to 61.6m	Eastern area of Main Zone

Table 2. Key mineralised intercepts, Adina Main Zone

Figure 1: Drill Results from Adina Footwall Zone Drilling
 Oblique view looking to north-east along conceptual model of Adina Main pegmatite

Commentary on Adina Footwall Zone

The Adina Footwall Zone was first detected in AD-23-054 when multiple spodumene-bearing pegmatite zones were logged¹. Drilling on adjacent sections was then deepened to investigate whether the intersections in AD-23-054 were from a new pegmatite body or from a repetition of the main body by folding (or other localised event).

As shown on Figures 1 and 2 and detailed in Tables 1 and 3 there are now sufficient intersections of spodumene-bearing pegmatites and supporting assays results to confirm that the Footwall Zone as a discrete zone of pegmatite mineralisation. Assays have been received from 6 intersections to date with assays from another 11 drillholes awaited. Full details of the drillholes can be found in the Appendices.

The Footwall Zone is generally thinner than the Main Zone however frequently more than one pegmatite dyke is intersected within the zone, with these noted to coalesce in certain locations leading to a thicker intersection. In addition the distance between the Main Zone and Footwall Zone is also observed to vary, likely relating to the structures along which the pegmatites were emplaced. Delineation and modelling of these zones will be important for project development as it will be advantageous in future mining to target locations where the two zones are in close proximity.

The Footwall Zone has now been intersected in drilling over a strike length of 760 metres (east-west). The lithium mineralisation in the Footwall Zone occurs as spodumene crystals hosted in pegmatite with no obvious visual differences to the Main Zone mineralisation observed during logging.

Outcrop of the Footwall Zone has not been identified at this time however with the advent of spring and improved access ground checking will be undertaken to confirm if the Footwall Zone does come to surface.

¹ "Further assays confirm Adina as a robust, high-grade lithium project" ASX Announcement 23 March 2023

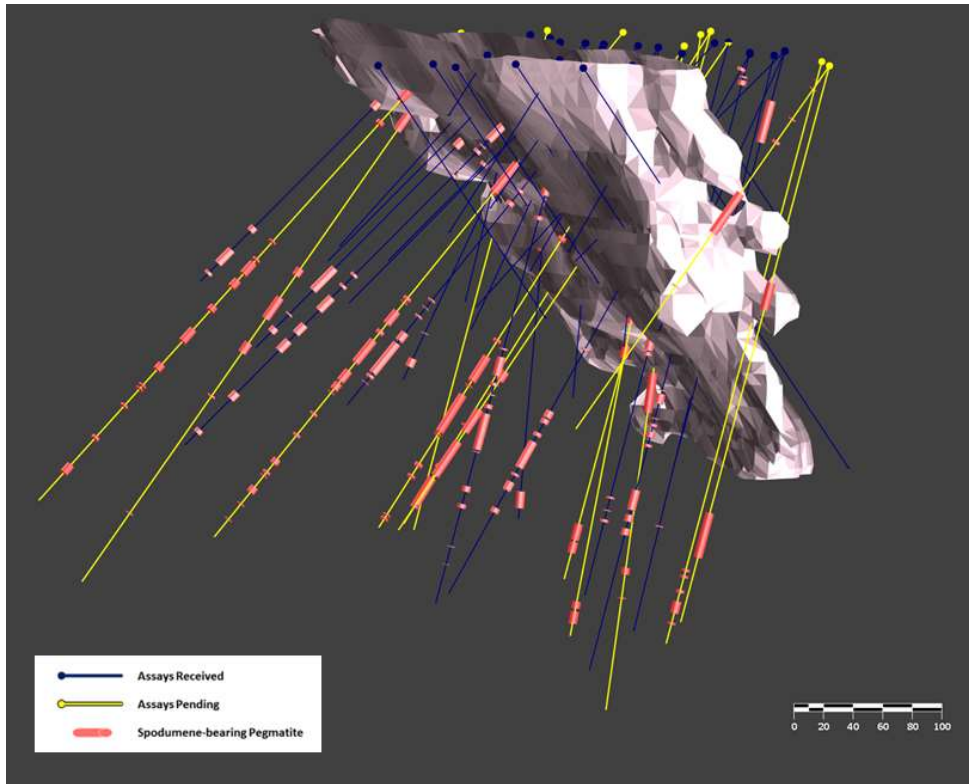

Figure 2: Spodumene-bearing pegmatite intervals logged in Adina Footwall Zone Drilling
Oblique view looking to north-east along conceptual model of Adina Main pegmatite

Hole	Intercepts	Setting
AD-23-022	215.3 – 232.6m pegmatite (17.3m interval) & 252.6 – 260.8m pegmatite (8.2m interval)	East
AD-23-023	345.2 – 365.6m pegmatite (20.4m interval)	Step-out to east of previous drilling
AD-23-025	255.5 – 279.6m pegmatite (24.1m interval) & 286.8 – 317.4m pegmatite (30.6m interval)	Central
AD-23-026	384.0 – 399.2m pegmatite (15.2m interval)	Central
AD-23-027	245.7 – 256.7m pegmatite (11.0m interval), 271.3 – 290.8m pegmatite (19.5m interval) & 298.0 – 336.7m pegmatite (38.7m interval)	Central
AD-23-029	271.3 – 278.7m pegmatite (7.4m interval), 302.8 – 320.9m pegmatite (18.1m interval), & 329.0 – 356.9m pegmatite (27.9m interval)	East
AD-23-033	378.2 – 386.8m pegmatite (8.6m interval)	Down-dip of previous drilling
AD-23-040	220.9 – 294.0m pegmatite (73.1m interval)	Central
AD-23-047	218.5 – 241.5m pegmatite (23.0m interval), 314.6 – 320.0m pegmatite (5.4m interval), & 410.2 – 417.7m pegmatite (7.5m interval)	East
AD-23-074	356.1 – 377.4m pegmatite (21.3m interval)	Step-out to east of previous drilling
AD-23-100	313.3 – 344.8m pegmatite (31.5m interval)	Step-out to west of previous drilling

Table 3. Drill observations, Adina Footwall Zone

The Company reminds investors that the presence of spodumene crystals within pegmatite does not necessarily equate to lithium mineralisation or indicate the percentage of lithium mineralisation, which can only be accurately confirmed by chemical assays. When such laboratory results become available, they will be reported in full in a future report.

Commentary on Adina Main Zone

Since the last exploration update² drilling has focussed on testing the continuity of mineralisation within the Adina Main Zone, principally to the east of previously reported results and in the central portion of the Main Zone. Drilling has also tested up- and down-dip from previous intersections.

New results received are shown on Figure 3 and summarised in Table 2 with all data from the programme to date included in the Appendices.

The Main Zone has now been intersected in drilling over a strike length of 830 metres (east-west) and down to a depth of 300m from surface. The Main Zone remains open to the east, west and at depth with 3 rigs actively drilling on site. A fourth rig is now being mobilised to site to enable additional drilling to be completed to provide increased data to inform geological and resource modelling.

A total of 54 holes have been completed for 14,847 metres as at the end of April. Assays to date have been received for 40 of these drillholes. Several new zones of spodumene-bearing pegmatite have been logged and submitted for assay as detailed in Table 4 and Appendix 4. Figure 4 shows the location of these holes.

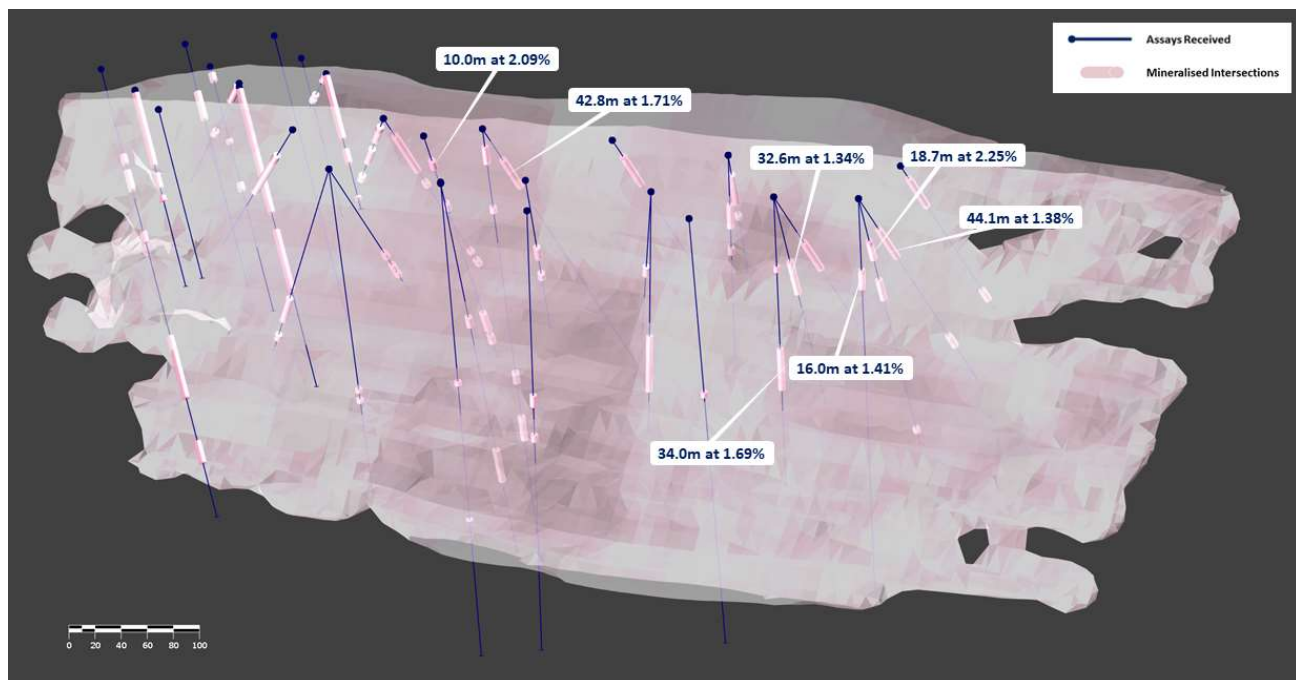

Figure 3: New Results from Adina Main Zone Drilling

² "Further assays confirm Adina as a robust, high-grade lithium project" ASX Announcement 23 March 2023

Hole	Intercepts	Setting
AD-23-010	105.3m – 138.0m pegmatite (32.7m interval)	Step-out to west of previous drilling
AD-23-022	35.4 – 42.2m pegmatite (6.8m interval) & 52.0 – 77.5m pegmatite (25.5m interval)	Eastern area of Main Zone, up-dip of previous drilling
AD-23-023	126.3 – 134.5m pegmatite (8.2m interval) & 196.3 – 229.2m pegmatite (32.9m interval)	Step-out to east of previous drilling
AD-23-025	107.5 – 140.5m pegmatite (33.0m interval)	Infill central area of Main Zone
AD-23-026	128.7 – 172.7m pegmatite (44.0m interval)	Infill central area of Main Zone
AD-23-027	55.6 – 81.4m pegmatite (25.8m interval), 115.7 – 140.7m pegmatite (25.0m interval)	Central area of Main Zone, up-dip of previous drilling
AD-23-033	160.1 – 178.0m pegmatite (17.9m interval)	Down-dip of previous drilling
AD-23-047	17.8 – 64.3m pegmatite (46.5m interval)	Eastern area of Main Zone, up-dip of previous drilling
AD-23-068	193.8 – 226.4m pegmatite (32.6m interval) & 231.4 – 258.5m pegmatite (27.1m interval)	Eastern area of Main Zone, down-dip of previous drilling
AD-23-074	168.4 – 183.9m pegmatite (15.5m interval)	Step-out to east of previous drilling
AD-23-076	93.4 – 107.8m pegmatite (14.4m interval)	Step-out to east of previous drilling
AD-23-100	152.1 – 171.2m pegmatite (19.1m interval)	Step-out to west of previous drilling

Table 4. New drill observations, Adina Main Zone

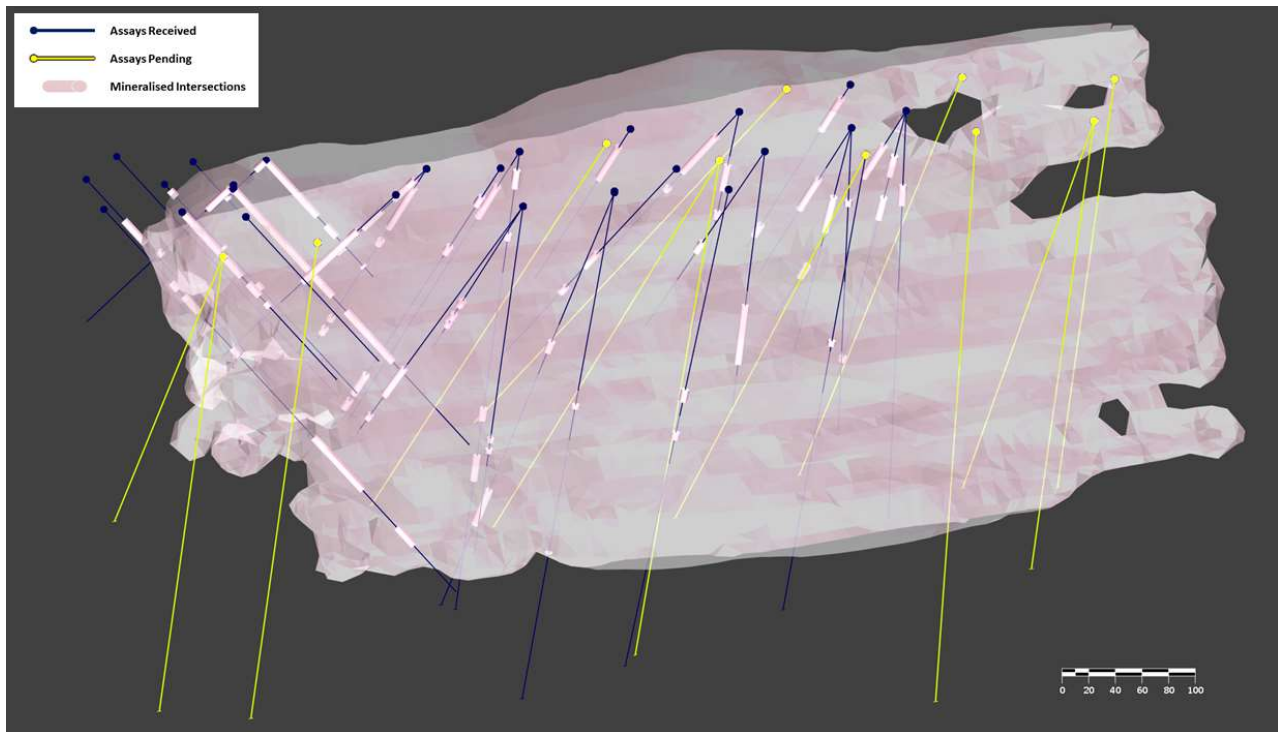

Figure 4: Oblique view of drilling to date at Adina Main Zone showing conceptual model of pegmatite body and drillholes where assays are pending

The Company reminds investors that the presence of spodumene crystals within pegmatite does not necessarily equate to lithium mineralisation or indicate the percentage of lithium mineralisation, which can only be accurately confirmed by chemical assays. When such laboratory results become available, they will be reported in full in a future report.

Winsome carries out logging of all drill samples at its nearby exploration project base. Visual estimates of the pegmatite mineralogy - as a percentage range of spodumene content, textures, mineralogy and omnipresent structures - are recorded by project geologists and supervisors prior to sending samples to the laboratory. Strict handling procedures and QAQC protocols are followed.

Further drilling updates, including summaries of visual observations of core recovered from drilling, will be provided on an on-going basis to the market. Core samples from all prospective intervals continue to be dispatched to SGS in neighbouring Ontario for analysis. Results will be reported when they become available. The Adina program's full results to date are set out in the appendices below.

Commentary on Cancet

A short RC drilling programme was carried out at Cancet in December 2022 (22 holes for 3,137 metres). The programme focussed on better delineating the main pegmatite body and adding further assay data with a view to forthcoming resource estimation work. In addition, drilling was opportunistically carried out at targets away from the main body such as those defined by gravity data³ and mapping / sampling during the 2022 field season⁴ with a view to prioritising these targets for more thorough drilling in 2023. To date assays have been received from all holes with the following notable results :

- 2.91% Li₂O + 504ppm Ta₂O₅ over 18.3m from 3.0m to 21.3m (WCRC-22-004), including:
 - 4.02% Li₂O + 728ppm Ta₂O₅ over 9.1m from 9.1m to 18.2m
- 0.99% Li₂O + 59ppm Ta₂O₅ over 15.2m from 1.5m to 16.8m (WCRC-22-006), including:
 - 1.55% Li₂O + 70ppm Ta₂O₅ over 6.1m from 4.6m to 10.7m
- 0.49% Li₂O + 136ppm Ta₂O₅ over 12.2m from 4.6m to 16.8m (WCRC-22-005), including:
 - 1.26% Li₂O + 308ppm Ta₂O₅ over 3.0m from 4.6m to 7.6m
- 0.46% Li₂O over 4.6m from 71.6m to 76.2m (WCRC-22-020) within a 106m pegmatite body;
- 0.31% Li₂O over 4.6m from 18.3m to 22.9m (WCRC-22-021) within a 46m pegmatite body;

The intersections in WCRC-RC-020 and 021 are significant since these holes tested a new pegmatite body ("Butte") some 4km north-east of the Cancet main pegmatite body (Figure 5). The pegmatite zones intersected are not mineralised across their entire thickness indicating fractionation of these bodies has occurred, a process which is key to the development of lithium mineralisation. Accordingly these results provide encouragement that further mineralisation may be present elsewhere in the Butte pegmatite.

³ Refer ASX Announcement 19 October 2022

⁴ Refer ASX Announcement 10 August 2022 and 5 October 2022

Detailed ground gravity surveying was also conducted at Cancet while access was available, with the program extended following highly encouraging results obtained at Cancet in October last year (see ASX release on 19 October 2022). Geophysical work focused on structural corridors interpreted from public domain airborne magnetics data and deemed favourable for pegmatite emplacement. Interpretation and target generation was undertaken by Perth-based consultancy NewGen Geo Pty Ltd, which specialises in the application of geophysics to pegmatite exploration.

Results of the survey have highlighted a number of new target areas located between 2km and 7km west of the Cancet main pegmatite body and within 1km of the Trans-Taiga Road (Figures 5 and 6).

Diamond drilling at Cancet re-commenced in January and 44 holes for 7,690 metres have been completed. Drilling tested targets across the Cancet project generated from Winsome's gravity surveys as well as testing depth extensions to lithium mineralisation intersected in previous drilling⁵. Results are awaited from all drillholes.

The next exploration phase at Cancet will be implemented during the summer field season and will include a new phase of gravity surveying to the east of the Cancet main pegmatite body. The area to be surveyed includes traverses over the newly identified "Butte" pegmatite. The surveys will provide a substantial dataset to aid targeting of pegmatite bodies within the project area, which will be integrated with field mapping and sampling from both the 2022 field season as well as guide the forthcoming 2023 field season. Systematic exploration of this nature was not completed by previous explorers, and it is anticipated this disciplined approach will allow Winsome to unlock the potential of the Cancet project.

ABOUT WINSOME RESOURCES

Winsome Resources (ASX: WR1) is a Perth-based, lithium focused exploration and development company with five project areas in Quebec, Canada. Three of Winsome's projects – Cancet, Adina and Sirmac-Clappier are 100% owned by the Company. The Company also has exclusive option agreements to acquire and explore 669 claims totalling 385km² in Decelles and a further 259 claims totalling 149km² at Mazerac, located near the Quebec mining town of Val-d'Ôr. Recently the Company acquired a further 47km² of claims at the Tilly Project, located near Adina.

The most advanced of Winsome's projects - Cancet and Adina, provide shallow, high grade lithium deposits and are strategically located close to established infrastructure and supply chains.

In addition to its impressive portfolio of lithium projects in Quebec, Winsome Resources owns 100% of the offtake rights for lithium, cesium and tantalum from Power Metals Corp (TSXV:PWM) Case Lake Project in Eastern Ontario, as well as a 10% equity stake in PWM.

Winsome is led by a highly qualified team with strong experience in lithium exploration and development as well as leading ASX listed companies.

CAUTION REGARDING FORWARD-LOOKING INFORMATION

This document contains forward-looking statements concerning Winsome. Forward-looking statements are not statements of historical fact and actual events and results may differ materially from those described in the forward-looking statements as a result of a variety of risks, uncertainties and other factors. Forward-looking statements are inherently subject to business, economic, competitive, political and social uncertainties and contingencies. Many factors could cause the Company's actual results to differ materially from those expressed or implied in any forward-looking information provided by the Company, or on behalf of, the Company. Such factors include, among other things, risks relating to additional funding requirements, metal prices, exploration, development and operating risks, competition, production risks, regulatory, including environmental regulation and liability and potential title disputes.

Forward-looking statements in this document are based on the Company's beliefs, opinions and estimates of Winsome as of the dates the forward-looking statements are made, and no obligation is assumed to update forward-looking statements if these beliefs, opinions and estimates should change or to reflect other future developments.

COMPETENT PERSON'S STATEMENT

The information in this report which relates to Exploration Results is based on, and fairly represents, information and supporting documentation prepared by Mr Carl Caumartin, General Manager Canada of Winsome Resources Ltd. Mr Caumartin is a member of the Quebec Board of Professional Engineers (OIQ, Canada), a Registered Overseas Professional Organisation as defined in the ASX Listing Rules, and has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which has been undertaken to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves".

Mr Caumartin consents to the inclusion in this release of the matters based on the information in the form and context in which they appear. Mr Caumartin is a shareholder of Winsome.

The information in this announcement relating to the Geophysical component of the Exploration Results is based on information and supporting documentation compiled by Mr Regis Neroni, who is a Member of the Australian Institute of Geoscientists (AIG) and a Registered Professional Geoscientist (RPGeo) in the fields of Geophysics and Mineral Exploration. Mr Neroni is a Consulting Geophysicist with NewGen Geo Pty Ltd and has sufficient experience relevant to the style of mineralisation under consideration and to the activity which is being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves".

Mr Neroni consents to the inclusion in this release of the matters based on the information in the form and context in which they appear.

Appendix 4 – Visual estimates of mineralisation intersections in Adina diamond drill holes where assays are yet to be received (main sampling intervals).

The Company reminds investors that the presence of spodumene crystals within pegmatite does not necessarily equate to lithium mineralisation or indicate the percentage of lithium mineralisation, which can only be accurately confirmed by chemical assays. When such laboratory results become available, they will be reported in full in a future report.

Hole ID	From (m)	To (m)	Thickness (m)	Visual Estimate %

⁸ Intercepts calculated using a 0.3 % Li₂O cut-off grade, minimum 3m thickness and widths including up to 7m internal dilution.

JORC Code, 2012 edition Table 1
Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	Explanation
Sampling techniques	<ul style="list-style-type: none"> All core is NQ (76mm) in this program. Core sample intervals were geologically logged, measured for average length, photographed, and placed into numbered core trays. RC drilling utilised face sampling hammers with samples split down to a 2kg sample size. Samples from Adina were sent to SGS Minerals Geochemistry under standard preparation procedures. Samples from Cancet were sent to AGAT Laboratories under standard preparation procedures. Gravity data obtained by ground measurements at regular intervals.
Drilling techniques	<ul style="list-style-type: none"> NQ diamond drilling was completed at Adina. RC percussion and NQ diamond drilling was completed at Cancet. Oriented core drilling was not completed. Downhole surveying was conducted using a gyro-based system.
Drill sample recovery	<ul style="list-style-type: none"> The recovery of the diamond drilling samples was reported by the operators and supervised by our consulting geologist. No sample bias has been established.
Logging	<ul style="list-style-type: none"> NQ core was logged and cut according to geological boundaries, with ~1 m intervals targeted for individual samples. For RC and DD drilling features such as rock type, modal mineralogy, rock textures, alteration were recorded. Geological logging information was recorded directly onto the GeoticLog system and compiled onto Database platform, with weekly backups. The core is stored in the Geological consultants (Technominex) yard in Rouyn-Noranda which is a secure location. Various qualitative and quantitative logs were completed. All core has been photographed. The logging database contains lithological data for all intervals in all holes in the database.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> Adina drill core was split (sawn) at the Winsome core logging and cutting facility located at the project base in James Bay, with half core samples intervals submitted to SGS preparation facilities in Val-d'Or, Quebec. Cancet drill core was split (sawn) at the Winsome core logging and cutting facility located at the project base in James Bay, with half core sample intervals submitted to AGAT Laboratories in Val-d'Or, Quebec.

Criteria	Explanation
	<ul style="list-style-type: none"> • Half core NQ samples are believed to be representative of the mineralisation targeted. Sampling intervals are based on geological boundaries to aid representivity. • Samples are crushed, milled and split at the laboratory (SGS or AGAT) to achieve a 250g sub-sample for assay. Laboratory QC procedures for sample preparation include quality control on checks crushing and milling to ensure representivity. • Ground gravity data was collected by Abitibi Geophysics and Atlas Geophysics. Station spacing was 20m x 100m. Gravity data were acquired using Scintrex CG-5u and CG-6 gravimeters. • Gravity data QAQC, processing and interpretation were undertaken by NewGen Geo Pty Ltd. Gravimeters underwent routine calibration with base station measurements used to adjust for drift and other effects in processing.
Quality control & Quality of assay data and laboratory tests	<ul style="list-style-type: none"> • Assay and laboratory procedures have been selected following a review of techniques provided by laboratories in Canada. SGS and AGAT are both internationally certified independent service providers. Industry standard assay quality control techniques were used for lithium related elements. • Samples are submitted for multi-element ICP analysis by SGS or AGAT Laboratories which is an appropriate technique for high-grade lithium analysis • Sodium Peroxide Fusion is used followed by combined ICP-AES and ICP-MS analyses (56 elements). Li is reported by the lab and converted to Li₂O for reporting using a factor of 2.153 • No handheld instruments were used for analysis. • Comparison of results with standards indicate sufficient quality in data. No external laboratory checks have been used but are planned to be completed shortly. • Different grades of certified reference material (CRM) for lithium mineralisation were inserted, as well as field duplicates, and blanks. The CRM's submitted represented a weakly mineralised pegmatite (OREAS 750), and a moderate lithium mineralised pegmatite (AMIS 0341) to high grade lithium mineralised pegmatite (OREAS 752 & 753). Quality Assurance and Quality Control utilised standard industry practice, using prepared standards, field blanks (approximately 0.4 kg), duplicates sampled in the field and pulp duplicates at the lab. • Blank samples were submitted at a rate of approximately 5%, same for duplicates and repeat assay determinations, whereas standards were submitted at a rate of approximately 20%.
Verification of sampling and assaying	<ul style="list-style-type: none"> • Significant intersections have been estimated by consultants to the company and cross checked.

Criteria	Explanation
	<ul style="list-style-type: none"> • Hard copy field logs are entered into and validated on an electronic database , which is maintained by Winsome on site in James Bay and backed up regularly by the Company's IT consultants in Val D'Or. • Data verification is carried out by the Project Geologist on site, and a final verification was performed by the Senior Geologist and the geologist responsible for database management. An independent verification is carried out by consultants to the company. • No assays have been adjusted. A factor of 2.153 has been applied to the reported Li assays by the laboratory so to report as Li₂O.
Location of data points	<ul style="list-style-type: none"> • The drill holes have been reported as being located by hand-held GPS. Historical drill holes have been verified by GPS. • Gravity stations were located using RTK GPS Leica ATX 1230GG and GS18 instrumentation. • The grid datum is NAD83. Zone 18N. • Topographic elevation and landmarks are readily visible from a Digital Elevation Model with a 50cm grid resolution and orthophoto obtained from Lidar surveys performed in 2017 and 2022 over the property. Government topographic maps have been used for topographic validation. The GPS is otherwise considered sufficiently accurate for elevation data. • Down hole dip surveys were taken at approximately 30m intervals and at the bottom of the diamond drill holes.
Data spacing and distribution	<ul style="list-style-type: none"> • In this early delineation stage, drilling is largely set along sections at 100m spacing and aiming to intercept targeted horizon at 80-100m centres. • No assessment has been made regarding the current drill hole location and intersections with respect to resources or reserve estimation. • Gravity stations spacing was 20m x 100m • No sample compositing has been completed. However, internal dilution of non-mineralised material into calculated grade over widths reported herein may occur but is not considerable.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> • Drilling is designed to confirm the historical drilling results and test potential mineralisation. They were oriented sub-perpendicular to the potential mineralised trend and stratigraphic contacts as determined by field data and cross section interpretation. Intersection widths will therefore be longer than true widths. • No significant sample bias has been identified from drilling due to the optimum drill orientation described above. Where present, sample bias will be reported.
Sample security	<ul style="list-style-type: none"> • The company takes full responsibility on the custody of the samples including the sampling process itself and transportation.

Criteria	Explanation
	<ul style="list-style-type: none">• Samples are shipped during the weekly supply run and delivered directly to the respective laboratories.
Audits or reviews	<ul style="list-style-type: none">• No external audit of the database has been completed, apart from by consulting geologists acting on behalf of the company.

Section 2 Reporting of Exploration Results

(Criteria in the preceding section also apply to this section.)

Criteria	Explanation
Mineral tenement and land tenure status	<ul style="list-style-type: none"> The Winsome Adina Lithium Project is 100% owned by Winsome Adina Lithium Inc. The Winsome Cancet Lithium Project is 100% owned by Winsome Cancet Lithium Inc. All tenements are in good standing and have been legally validated by a Quebec lawyer specialising in the field.
Exploration done by other parties	<ul style="list-style-type: none"> Initial Exploration and Review was undertaken by MetalsTech Limited. Government mapping records multiple lithium bearing pegmatites within the project areas with only regional data available.
Geology	<ul style="list-style-type: none"> The mineralisation encountered at the Adina project is typical of a Lithium-Caesium-Tantalum (LCT) type of pegmatite. The pegmatite body is oriented sub-parallel to the general strike of the host rocks. The host rocks are composed of Archean Lac Guyer greenstone rocks, which include mafic and ultramafic rocks interlayered with horizons of metasedimentary and felsic volcanic rocks
Drill hole Information	<ul style="list-style-type: none"> For the current drill program, the following information has been included for all holes reported: <ul style="list-style-type: none"> easting and northing of the drill hole collar elevation or RL (reduced level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception level hole length A summary of drill hole information was included in the Independent Geologists Report prepared by Mining Insights within the Company's prospectus
Data aggregation methods	<ul style="list-style-type: none"> No sample weighting or metal equivalent values have been used in reporting. Aggregation issues are not considered material at this stage of project definition. No metal equivalent values were used
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> The pierce angle of the drilling varies from hole to hole, in order to attempt, wherever possible, to represent true widths
Diagrams	<ul style="list-style-type: none"> See figures and maps provided in the text of the announcement.
Balanced reporting	<ul style="list-style-type: none"> Winsome Resources Ltd will endeavour to produce balanced reports accurately detailing the results from any exploration activities.

Criteria	Explanation
	<ul style="list-style-type: none">• All drillholes and intersections have been presented in this announcement and in previous announcements.
Other substantive exploration data	<ul style="list-style-type: none">• All substantive exploration data has been included in ASX Announcements. No other substantive exploration data is available at this time.
Further work	<ul style="list-style-type: none">• Winsome Resources Ltd continues to complete further site investigations.• Further work planned includes comprehensive data interpretation, field mapping and exploration drilling.
