UPDATE: DRILLING AT TOTTENHAM RETURNS UP TO 5.03% COPPER AND 0.53G/T GOLD

Locksley Resources Limited is pleased to announce that all assay results have been received from the drilling program conducted at the Tottenham Copper-Gold Project.

Highlights:

- Results received for 18 RC drillholes totaling 3,267m
- Drilling was designed to add to known resources and extend into new areas
- Global Inferred JORC Mineral Resource stands at 9.86Mt @ 0.72% Cu, 0.22g/t Au prior to current drilling program
- Mount Royal – Orange Plains infill drilling
 - 8m @ 1.57% Cu and 0.16g/t Au from 65m (TORC030)
 - Including 2m @ 5.03% Cu and 0.53g/t Au from 67m

Locksley Resources Limited Managing Director, Steve Woodham commented:

"Two recent drilling programs were completed during the first half of this year at the Tottenham Copper project in NSW. Resource infill drilling continues to improve on current figures and confirms the deposit remains open at depth.

DHEM is being planned for drillholes that encountered mineralisation and if successful will provide further drill targets.

The recent drilling campaign also tested regional EM anomalies.

Follow up drilling is required to continue expanding the project parameters. Locksley is well funded to continue our commitment in adding to the copper gold Resource at Tottenham."

Drilling Results

Locksley Resources Limited (**ASX:LKY**) (“**Locksley**” or “**the Company**”) have received all assay results from the RC drilling program conducted during the 2nd quarter of 2023. Drilling predominantly focused on testing targets for additional resources to complement the existing Inferred JORC Mineral Resource Estimate (MRE) of **9.86 Mt @ 0.72% Cu and 0.22g/t Au** at the Mount Royal – Orange Plains Deposit.

Mount Royal – Orange Plains

Infill Drilling

Hole TORC030 was drilled within the Mount Royal – Orange Plains MRE and returned **8m @ 1.57% Cu and 0.16g/t Au** with a higher-grade core of **2m @ 5.03% Cu and 0.53g/t Au**.

TORC030 is interpreted to represent the portion of the deposit that displays high-grade ‘lodes’ or ‘ribbons’ within the broader global resource, with more drilling these ‘ribbons’ are open down plunge and have the potential to significantly increase the grade and tonnage of the overall resource.

Additional infill drilling within the Mount Royal – Orange Plains MRE included TORC031 which returned 10m @ 0.42% Cu and 0.35g/t Au, including 1m @ 1.19% Cu and 0.31g/t Au.

A number of holes (TORC036-039) were drilled to test interpreted west plunging sulphide ribbons¹, down plunge of the Orange Plains portion of the resource. Three of the four holes intersected significant copper, gold mineralisation:

- TORC036 – 2m @ 1.45% Cu and 1.15g/t Au from 158m
- TORC037 – 11m @ 0.56% Cu and 0.16g/t Au from 162m
 - Including 1m @ 1.43% Cu and 0.39g/t Au from 162m; and
 - Including 1m @ 1.70% Cu and 0.43g/t Au from 172m
- TORC038 – 2m @ 1.10% Cu and 0.20g/t Au from 152m; and
 - 1m @ 2.77% Cu and 0.95g/t Au from 176m

1. LKY Investor Presentation – 15 September 2022

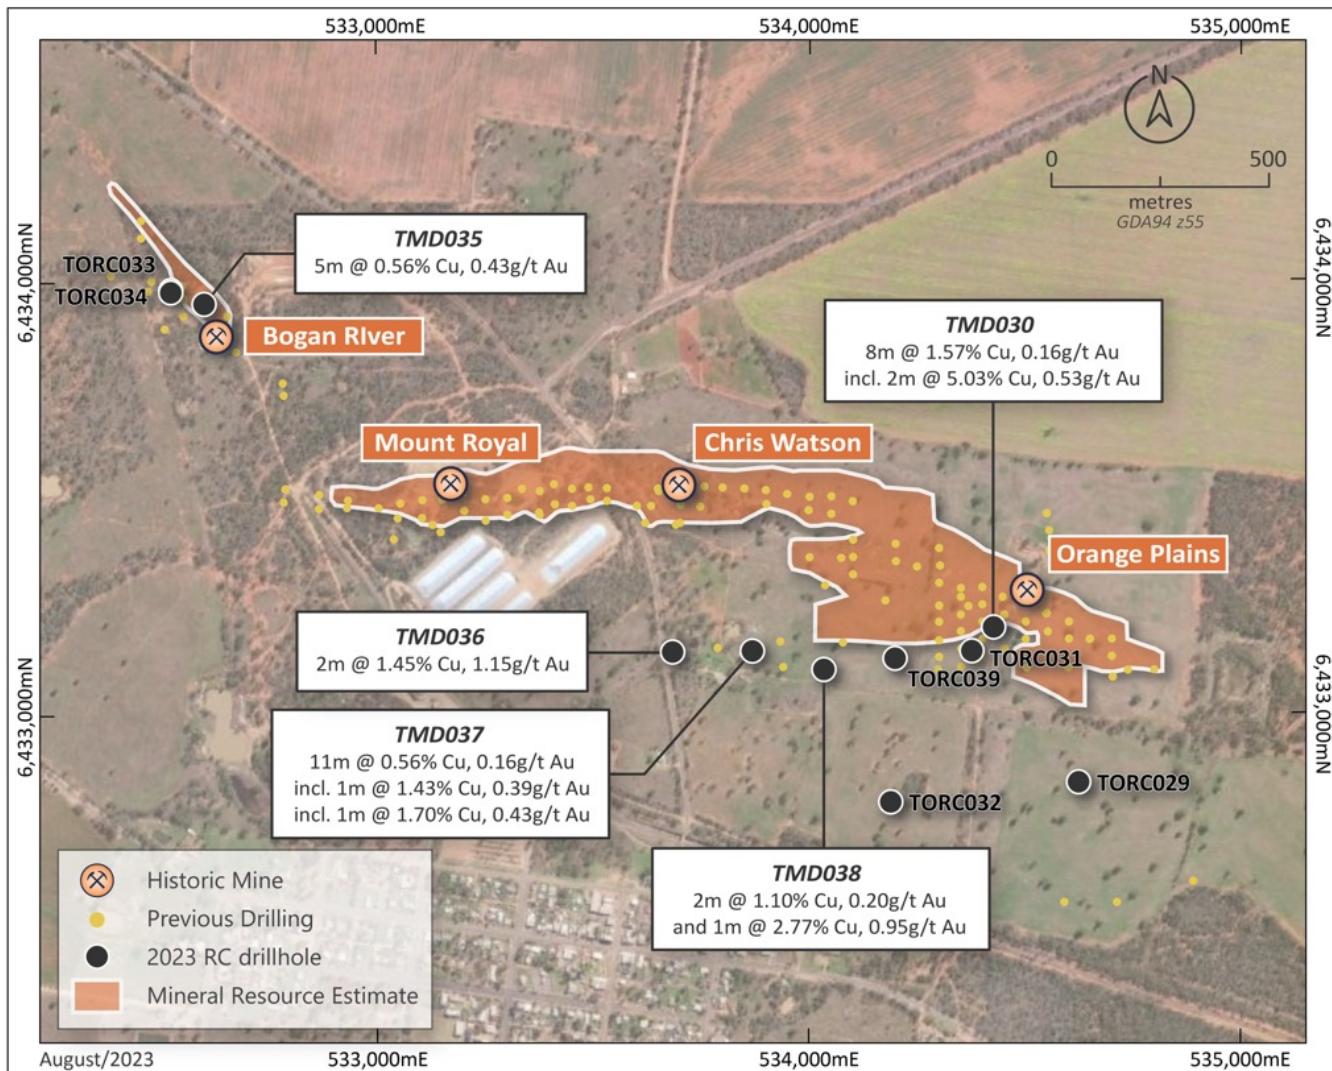

Figure 3: Plan view showing drilling locations relative to MRE domain outlines

Bogan River

The Bogan River prospect is approximately 600m north-west of Mount Royal – Orange Plains.

Three (3) holes were drilled following up a previous drill intercept of 16m @ 6.94% Cu from 3m (TPRC043)¹ associated with historic underground workings.

All three holes were abandoned due to intercepting cavities located within historic mine workings, encouragingly one hole (TORC035) returned 5m @ 0.89% Cu and 0.43g/t Au from 30m immediately prior to intersecting underground workings. The Bogan River prospect therefore remains open.

1. LKY Investor Presentation – 15 September 2022

Jimmy Woodser

Jimmy Woodser Prospect lies approximately 5.5km east-south-east of Mount Royal – Orange Plains and 3.3km south-west of Carolina Deposits.

Four (4) holes were drilled to follow-up the previous drill intercept of 24m @ 0.73% Cu from 32m (TPRC057)¹ spatially related to modelled EM conductors.

Two (2) of the holes intercepted mineralisation JWRC002 returned 9m @ 0.29% Cu and 0.08g/t Au from 29m.

Mineralisation remains open at Jimmy Woodser and requires additional drilling to test down plunge of the known copper, gold mineralisation.

Figure 4: Jimmy Woodser Prospect - Plan view showing drilling locations

1. LKY Investor Presentation – 15 September 2022

Electromagnetic (EM) Anomalies

Additional targets were identified in the latest geophysical HeliTEM² survey conducted over parts of EL6592, EL8384 and EL9307 during June 2022. The 1066.2-line km survey has identified new additional anomalies located at Lacey's Tank, Jimmy Woodser Mine and Effies Ace Mine. Some of the identified electro-magnetic (EM) anomalies are located to the east of the Mount Royal-Orange Plains deposit with the potential to significantly increase the strike of the copper-gold trend.

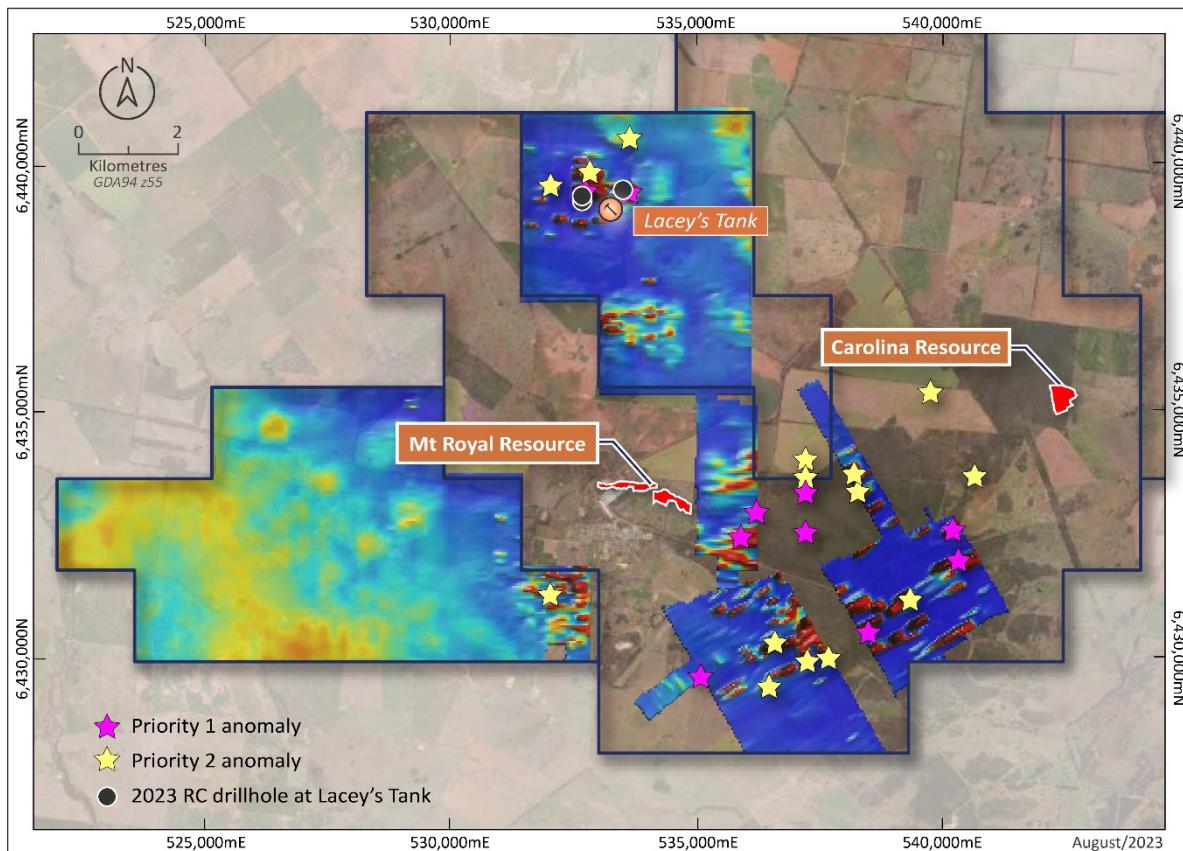

Figure 5: Tottenham Project – Historic drillholes and ranked HeliTEM² anomalies in the Tottenham area with current resources shown in orange.

The HeliTEM² results indicate that a large portion of the central and southern areas of EL6592 contain multiple prospective EM conductors. Three (3) holes were drilled at Lacey's Tank (LTRC001-003) following up EM anomalies with surface indications of copper-gold mineralisation, the holes did not return any significant copper-gold anomalism, most of the generated EM anomalies from the 2022 survey remain untested.

The Board of Directors of Locksley Resources Limited authorised the release of this announcement.

Compliance Statements

Forward-Looking Statements

This document may include forward-looking statements. Forward-looking statements include, but are not limited to, statements concerning the Company's planned exploration program and other statements that are not historical facts. When used in this document, the words such as "could," "plan," "expect," "intend," "may," "potential," "should," "further" and similar expressions are forward-looking statements. Although the Company believes that its expectations reflected in these forward-looking statements are reasonable, such statements involve risks and uncertainties and no assurance can be given that further exploration will result in additional Mineral Resources.

Competent Persons

Except where indicated, exploration and technical information above have been reviewed and compiled by David Ward BSc, a Competent Person who is a Member of the Australian Institute of Mining and Metallurgy, (Member Number 228604) with over 25 years of experience in metallic minerals mining, exploration and development, and has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Ward is a part-time employee and shareholder of Locksley Resources Limited and consents to the inclusion of this technical information in the format and context in which it appears.

About the Tottenham Project

The Tottenham Project is an advanced Cu-Au exploration project that consists of four Exploration Licences, (EL6592, EL6656, EL8384, EL9307), covering 470km², located in the Lachlan Fold Belt of central New South Wales.

Tottenham Project location

The Tottenham deposits are hosted within the Ordovician Girilambone Group that also host the Tritton and Girilambone Mines and Constellation Deposit, 110km to the north-northwest (Aeris Resources Ltd.). Resources have been defined at both the Mount Royal to Orange Plains and Carolina Deposits for a global inferred resource of:

9.86Mt @ 0.72% Cu, 0.22g/t Au, 2g/t Ag at a 0.3% Cu cut off.

The Competent Person for the 2022 Resource is Mr Jeremy Peters FAusIMM CP(Geo, Min), a Director of Burnt Shirt Pty Ltd. The Mineral Resource estimate is stated in accordance with the provisions of the JORC Code (2012). Mr Peters has more than five years' experience in the estimation and reporting of Mineral Resources for base metals mineralisation in Australia and overseas, to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Peters consents to the inclusion in the presentation of the matters based on his information in the form and context in which it appears.

JORC Code, 2012 Edition – Table 1 report template

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

| Criteria | JORC Code explanation | Commentary |
|---------------------|--|---|
| Sampling techniques | <ul style="list-style-type: none"><i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i><i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> | <ul style="list-style-type: none">Reverse circulation drilling was used to obtain 1 m cone split samples from which 3 kg was pulverised to produce a 30 g charge for gold fire assay (Au-AA23 & Au-AA25) and 4 acid digest Inductively Coupled Plasma (ME-ICP61) AES multielement analysis for 33 elements at ALS Orange.ME-OG62 ore grade four acid digest was used to detect Cu, Pb, Zn and Ag.S-IR08 laboratory analysis was used to determine total sulphur.Calico samples were collected in 2m composites outside areas of mineralisation and 1m intervals within zones of interest by drilling off-siders. Calico bags were left on the primary collection outlet located at the base of the cone splitter while the RC drilling was conducted.However, bulk samples were still collected every 1m interval in green UV resistant plastic bags.Drill chips were collected for each 1-meter sample collected and placed in plastic chip trays which are stored at the Locksley office for future reference.Certified reference material (CRM) was inserted every 44 samples sent to the laboratory for analysis.Field duplicate samples were collected every 41 samples sent to the laboratory for analysis.Sample blanks were inserted every 205 samples sent to the laboratory for analysis. |
| Drilling techniques | <ul style="list-style-type: none"><i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i> | <ul style="list-style-type: none">The drilling program was completed on the 28th of April and used reverse circulation (RC) methods.RC drilling was completed using a 150mm face-sampling hammer. Samples were captured in a cyclone and split using rotating cone splitter.The drill rig was accompanied by an air truck with a booster. |

| Criteria | JORC Code explanation | Commentary |
|--|---|--|
| Drill sample recovery | <ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. | <ul style="list-style-type: none"> The RC drilling samples were collected in 1-meter green UV plastic bags, sample recovery was estimated from visual inspection. For the holes reported, the sample recovery was considered acceptable. Limited samples were affected by intercepting historic mine cavities, influx of ground water, broken inner tubes, broken O rings and lack of recovery for these samples were noted at the time of RC drilling. Foam injection was used to suppress water inflow as required. Zones experienced by wet samples and poor recovery were minimal and logged at the time of RC drilling. Drillers spent adequate time using compressed air to clean water out of the hole after additional rods were added to increase the hole depth. There is no known bias or relationship between sample recovery and grade as assay results highlight no grade from drillchip samples. |
| Logging | <ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. | <ul style="list-style-type: none"> Systematic geological logging was undertaken onsite at EL6592 & EL9307 at the time of RC drilling. Data collected from rockchip analysis includes: Nature and extent of weathering including location of base of complete weathering and top of fresh rock. Nature and extent of lithologies. Relationship between lithologies. Amount and mode of occurrence of ore minerals. Nature and extent of veining. Magnetic susceptibility measurements for every 1m sample collected by cone splitter. Both qualitative and quantitative data was collected. RC chips were retained in chip trays and stored in the Locksley office. Chip trays were photographed. |
| Sub-sampling techniques and sample preparation | <ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in | <ul style="list-style-type: none"> Calico samples were collected in 2m composites outside areas of mineralisation and 1m intervals within zones of interest by drilling off-siders. Calico bags were left on the primary collection outlet located at the base of the cone splitter while the RC drilling was conducted. RC samples were collected using a rotating cone splitter. The majority of samples collected were dry and if samples were found to be wet due to lack of compressed air keeping the groundwater out, the condition of the sample was noted in the sampling data field sheet. |

| Criteria | JORC Code explanation | Commentary |
|---|--|---|
| | <p><i>situ material collected, including for instance results for field duplicate/second-half sampling.</i></p> <ul style="list-style-type: none"> • Whether sample sizes are appropriate to the grain size of the material being sampled. | <ul style="list-style-type: none"> • RC samples were dried, crushed, and pulverised 500 g split to better than 85% passing 75 microns. • Certified Reference Material (CRM) were inserted every 44 samples to assess the accuracy and reproducibility of the drill chip results. • Results of the CRM's were within acceptable tolerance. • Field duplicates were collected every 41 samples using a second calico bag which was attached to an additional sample collection outlet located on the rotating cone splitter. The samples were dried, crushed, and pulverised 500 g split to better than 85% passing 75 microns. The results of the duplicates were within acceptable tolerance from original cone spilt sample intervals. • Sample blanks were inserted every 205 samples sent to the laboratory for analysis. |
| <i>Quality of assay data and laboratory tests</i> | <ul style="list-style-type: none"> • The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. | <ul style="list-style-type: none"> • Gold (Au) was determined by 30g fire assay (method Au-AA23 & Au-AA25) with a detection limit of 0.01ppm. • 33 elements by HF-HNO₃-HClO₄ acid digestion, HCl leach and ICP-AES (ME-ICP61). Quantitatively dissolves nearly all elements for the majority of geological materials. • ME-OG62 ore grade four acid digest was used to detect Cu, Pb, Zn and Ag. • S-IR08 laboratory analysis was used to determine total sulphur. • No geophysical tools were used in the determination of assay results. • Magnetic susceptibility was recorded using an Exploranium KT-9 Magnetic Susceptibility handheld instrument. • Certified Reference Material (CRM) were inserted every 44 (43.93) samples to assess the accuracy and reproducibility of the drill chip results. The results of the standards were considered to agree with certified values and validate the laboratory's measurement procedures. • Field duplicate samples were collected every 41 (40.33) samples sent to the laboratory for analysis. • Sample blanks were inserted every 205 samples sent to the laboratory for analysis. • Standards were used to cover high grade, medium grade, low grade, and trace ranges of elements, with a primary focus on gold and base metals. • The airborne HELITEM² survey was conducted using a HELITEM² 35m diameter loop with a vertical axis loop transmitter slung below |

| Criteria | JORC Code explanation | Commentary |
|----------|-----------------------|---|
| | | <p>helicopter with a multicoil system (X, Y and Z) receiver with a final recording rate of 10 samples per second, 25 channels of X, Y and Z component data.</p> <ul style="list-style-type: none"> The HELITEM² electromagnetic receiver (dB/dt – X, Y & Z) data are in units of nanoteslas per second (nT/s) and are normalized by the effective receiver area ($1 \text{ nV}/\text{m}^2 = 1 \text{ nT}/\text{s}$). The data are not normalized by transmitter moment. Data were acquired using a HELITEM² electromagnetic system supplemented by a high-sensitivity cesium magnetometer. The information from these sensors was processed to produce products that display the magnetic and conductive properties of the survey area. The base station equipment uses a Scintrex cesium vapour sensor with Marconi GPS card and antenna for measurement synchronization to GPS. The GPS receiver is a JAVAD TRIUMPH-1M with a real-time accuracy of <0.5m with a sample rate of 1.0Hz. A GPS electronic navigation system ensured accurate positioning of the geophysical data with respect to the base map coordinates. Survey coverage consisted of 996.3 km traverse lines flown with spacing of 100/200/400/600 m and 0.0 km of tie-lines for a total of 996.3 km flown. During the HELITEM² survey. Digital data for each flight were transferred to the office in order to verify data quality and completeness. A database was created and updated using Geosoft Oasis Montaj and proprietary Xcalibur Atlas software. This allowed the processor to calculate, display and verify both the positional (flight path) and geophysical data. The initial database was examined as a preliminary assessment of the data acquired for each flight. Daily processing of survey data consists of differential corrections to the airborne GPS data, verification of EM calibrations, drift correction of the raw airborne EM data, spike rejection and filtering of all geophysical and ancillary data, verification of the digital video, calculation of preliminary resistivity data and diurnal correction of magnetic data. All data, including base station records, were checked on a daily basis to ensure compliance with the survey contract specifications. Re-flights were required if any of the following specifications were not met. |

| Criteria | JORC Code explanation | Commentary |
|--|---|--|
| | | <ul style="list-style-type: none"> The in-flight calibration consists of measuring the system characteristics out of ground effect and compensation of the electromagnetic data for these measured effects. The reference waveforms recorded during the pre-flight calibration form an important part of the delivered data and are critical to accurate inversion of the data. During the pre-flight calibration, a minimum of 30 seconds of data is collected out-of-ground-effect to monitor the effectiveness of the calibration and the accuracy of the base levels. During any post-flight calibration, a minimum of 30 seconds of data is collected out-of-ground-effect; these data are compared with the pre-flight calibration data of any quantify drift. Measurements of in-flight noise levels, out of ground effect, are made at the high-altitude portions of each flight. Static or hover noise levels are not directly related to those seen in flight due to geometry and compensation considerations that are only addressed in a dynamic situation. |
| <i>Verification of sampling and assaying</i> | <ul style="list-style-type: none"> <i>The verification of significant intersections by either independent or alternative company personnel.</i> <i>The use of twinned holes.</i> <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> <i>Discuss any adjustment to assay data.</i> | <ul style="list-style-type: none"> Drillhole data is compiled and collated and reviewed by senior staff. Twinned holes have not been used in the drilling. Drill hole data including meta data, gear left in the drillhole, lithological, mineral, survey, sampling, and magnetic susceptibility was collected and stored as electronic copies in excel format using drop down codes during the RC drilling program. When complete the spreadsheet was combined into a master excel spreadsheet as the drill hole database prior to being loaded into an ODBC relational database. Assay data was provided by ALS via .csv spreadsheets and the data were validated using the results received from the known certified reference material. Hard copies of the assay certificates were stored with drillhole data such as drillers plods, invoices, and hole planning documents. Assay data is not adjusted. |
| <i>Location of data points</i> | <ul style="list-style-type: none"> <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> <i>Specification of the grid system used.</i> <i>Quality and adequacy of topographic control.</i> | <ul style="list-style-type: none"> Historic drillhole collars were located using either a licensed surveyor, handheld GPS or on a local imperial or metric grid. Conversion of the local grid coordinates has been undertaken by previous exploration companies. Locksley has used DGPS surveying of drillholes ($\pm 0.1\text{m}$ accuracy). Some historic drillholes were relocated and surveyed by DGPS as a check. All coordinates are based on Map Grid Australia Zone 55, Geodetic |

| Criteria | JORC Code explanation | Commentary |
|--|--|--|
| | | <p>Datum of Australia 1994.</p> <ul style="list-style-type: none"> Historic drillhole collars were located using either a licensed surveyor, handheld GPS or on a local imperial or metric grid. Conversion of the local grid coordinates has been undertaken by previous exploration companies. Topography is subdued and vertical variation in hole locations is limited. |
| <i>Data spacing and distribution</i> | <ul style="list-style-type: none"> <i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> <i>Whether sample compositing has been applied.</i> | <ul style="list-style-type: none"> Data spacing is variable. Drilling is a combination of infill between historic drilling and extensional drilling of a more exploratory nature. Composite sampling was applied outside areas of mineralisation and within drillholes focusing on new EM targets and 1m intervals were sampled within zones of interest. |
| <i>Orientation of data in relation to geological structure</i> | <ul style="list-style-type: none"> <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> | <ul style="list-style-type: none"> Drilling was oriented to intersect perpendicular to the mineralised trend, as a result intercepts reported are interpreted to be true width. There is no known bias related to drilling orientation. |
| <i>Sample security</i> | <ul style="list-style-type: none"> <i>The measures taken to ensure sample security.</i> | <ul style="list-style-type: none"> The sample chain of custody has only been managed by employees of Locksley Resources Limited, who commissioned the drilling, from drill rig to assay laboratory. All samples were bagged and tied in numbered calico bags, grouped into larger tied polyweave bags, placed in a stillage crate, and transported to ALS Orange by Locksley personnel. All sample submissions are documented via ALS tracking system and all assays are reported via email. Sample pulps are returned to site and stored in an appropriate, sealed container for an appropriate length of time (minimum 3 years). The Company has in place protocols to ensure data security. Geophysical data was acquired and stored on in-house software systems. |
| <i>Audits or reviews</i> | <ul style="list-style-type: none"> <i>The results of any audits or reviews of sampling techniques and data.</i> | <ul style="list-style-type: none"> Data and sampling techniques have not been reviewed or audited by a third party. |

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

| Criteria | JORC Code explanation | Commentary |
|---|--|---|
| Mineral tenement and land tenure status | <ul style="list-style-type: none"> <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> | <ul style="list-style-type: none"> All drilling on EL6592 which is 100% owned by Locksley Resources Ltd. EL6592, EL6656, EL8384 and EL9307 form the Tottenham Project. The majority of these licences are covered by freehold farmland. Parts of EL6592 are covered by the Tottenham and Carolina State Forests, administered by Forestry Corporation NSW. All exploration licences are in good standing. EL6592 expires 29/6/2026. EL6656 expires 27/10/2026. EL8384 expires 28/7/2026. EL9307 expires 16/10/2027. |
| Exploration done by other parties | <ul style="list-style-type: none"> <i>Acknowledgment and appraisal of exploration by other parties.</i> | <ul style="list-style-type: none"> The Tottenham field had mining present from 1872 to 1977. Major mines were present at Mount Royal, Orange Plains, Bogan River, Ace, and Carolina. The most active period of production was between 1905 and 1917. Little or no production was recorded between 1921 and 1925, owing to a combination of low copper prices and drought. There was no production in 1928 and between 1931 and 1942. In 1943 minor tonnages were won from the Mt. Royal, and Bogan River mines. There was minor production each year from 1946 to 1977 which came from operations at the Mt. Royal, Bogan River, Underlay and Carolina Mines and from leaching at the Mt. Royal, Carolina and Underlay Mines. Significant exploration drilling has occurred at the Bogan River to Effies Ace group of mines and about the Carolina Mine. Main recent explorers are Arimco Mining – Straits Resources (1996-2001) with 93 RC holes and Mincor Resources – Bacchus Resources (2006 -2020) with 83 aircore holes, 104 RC holes and 48 diamond holes. All of this drilling appears to have been undertaken using standard industry practice. 19 historic holes are also present at the NSW government core archive. |
| Geology | <ul style="list-style-type: none"> <i>Deposit type, geological setting and style of mineralisation.</i> | <p>The Tottenham deposits are hosted within the Ordovician Girilambone Group. The project area lies within the Girilambone Anticlinorium Zone of the Lachlan Fold Belt. Rock types are dominantly sequences of turbidites comprising sandstone and siltstone as well as minor chert, and conglomerate. Interbedded mafic volcanic, volcaniclastic and intrusive mafic units show a spatial association with copper mineralisation. The</p> |

| Criteria | JORC Code explanation | Commentary |
|-------------------------------|---|--|
| | | <p>Girilambone Group is characterised by north-south trending thrust-bounded packages that separate Early Ordovician (Narrama Formation) and Middle Ordovician (Ballast and Lang Formations) units. The Early Ordovician Narrama Formation (~475Ma) hosts the bulk of the mafic igneous units, coarser-clastics, quartz-magnetite units and mineralisation. The majority of the mafic units are interpreted to be sills that have intruded into unconsolidated turbiditic sediments. Younger sediments cover much of the belt resulting in limited outcrop of less than 10%. The Girilambone Group is regionally metamorphosed to greenschist facies with a complex deformation history and is strongly folded with noticeably more metamorphism and deformation in the Tottenham area. Tight isoclinal folds are observed at the sub-metre scale, although large open folds are common such as the Orange Plains anticline. Metamorphism and deformation are mostly related to the Early Silurian Benamberan Orogeny, (~435 Ma). Metamorphism in the Tottenham area has led to the rocks being described as metasedimentary and mafic schists. The deposits are considered to be Besshi - Type sulphide copper-gold deposits that have been modified by deformation. Besshi - Type deposits are named after deposits on the southern Japanese island of Shikoku. The mineralisation in these systems is typically copper-rich with lesser zinc, silver, gold and minor cobalt within well-developed iron-sulphide (pyrite / pyrrhotite) bodies. The host rocks are commonly sedimentary rocks, and, as at Tottenham, these have been intruded and interlayered with basaltic igneous rocks. Mineralised horizons tend to be narrow but extensive. The best copper and zinc grades are typically proximal to the source of the fluids that formed these bodies – possibly “black smokers” erupting from the sea floor, driven by underlying igneous activity. Alternatively, unconsolidated sediments may be impregnated by metal bearing solutions below the sea floor.</p> |
| <i>Drill hole Information</i> | <ul style="list-style-type: none"> • A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> ○ easting and northing of the drill hole collar ○ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar ○ dip and azimuth of the hole ○ down hole length and interception depth ○ hole length. • If the exclusion of this information is justified on the basis that the | <ul style="list-style-type: none"> • Drillhole collar locations, collar orientations, depths, and assays are represented in the body of the announcement. |

| Criteria | JORC Code explanation | Commentary |
|--|--|---|
| | <p><i>information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i></p> | |
| Data aggregation methods | <ul style="list-style-type: none"> <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> <i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> | <ul style="list-style-type: none"> Where reported, drilling results have been length weighted. No high cut-off has been applied. Cut off grades for anomalous intervals are either 0.1% Cu or 0.1ppm Au with up to 2m internal dilution. Intercepts are length weighted with no cutting of grades. This may lead to elevation of intercept grades due to the presence of a narrow interval of high-grade material. Such high-grade zones are reported as included intercepts inside the broader intercept. No metal equivalences quoted. |
| Relationship between mineralisation widths and intercept lengths | <ul style="list-style-type: none"> <i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i> | <ul style="list-style-type: none"> Drillholes reported are interpreted to be drilling perpendicular to the orientation of the mineralised trend and deemed to be true width. Mineralisation is represented by logged sulphides, assays, and magnetic susceptibility. |
| Diagrams | <ul style="list-style-type: none"> <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> | <ul style="list-style-type: none"> See body of the announcement. Significant intercepts were highlighted from assay results that warrant further investigations or visual representations of drillhole traces and collars within diagrams. |
| Balanced reporting | <ul style="list-style-type: none"> <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i> | <ul style="list-style-type: none"> All assay results appear in the body of announcement. |
| Other substantive exploration data | <ul style="list-style-type: none"> <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> | <ul style="list-style-type: none"> All material results are shown in the body of the announcement. |
| Further work | <ul style="list-style-type: none"> <i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> | <ul style="list-style-type: none"> See the body of the announcement for planned further work on extending the current Inferred JORC Compliant Resource for the Mount Royal-Orange Plains Deposit. |
